KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vol. I.

ā as in ale, fate.
ā " " senate, chaotic.
ā " " glare, care, and as *e* in there.
ā " " am, at.
ā " " arm, father.
ā " " ant, and final *a* in America, armada, etc.
α " " final, regal, pleasant.
α " " all, fall.
ē " " eve.
ē " " elate, evade.
ē " " end, pet.
ē " " fern, her, and as *i* in sir, etc.
e " " agency, judgment.
i " " ice, quiet.
i " " quiescent
i " " ill, fit
ō " " old, sober.
ō " " obey, sobriety.
ō " " orb, nor.
ō " " odd, forest, not.
o " " atom, carol.
oi " " oil, boil.
ōō " " food, fool, and as *u* in rude, rule.
ou " " house, mouse.
ū " " use, mule.
ū " " unite.
ū " " cut, but.
u " " full, put, or as *oo* in foot, book.
ū " " urn, burn
y " " yet, yield
B " " Spanish Habana, Córdoba, where it is like English *v* but made with the lips alone.

ch as in chair, cheese.
D " " Spanish Almodovar, pulgada, where it is nearly like *th* in English then.
g " " go, get.
G " " German Landtag = *ch* in Ger. ach, etc.
H " " *j* in Spanish Jijona, *g* in Spanish gila; like English *h* in hue, but stronger.
hw " " *wh* in which.
K " " *ch* in German ich, Albrecht = *g* in German Arensburg, Mecklenburg, etc.
n " " in sinker, longer.
ng " " sing, long.
N " " French bon, Bourbon, and *m* in the French Étampes; here it indicates nasalizing of the preceding vowel.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh " " *z* in azure, and *s* in pleasure.

An apostrophe [*'*] is sometimes used as in *tā'b'l* (table), *kāz'm* (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as *G*, *H*, *K*, *N*, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

PANJABI (pūn-jī'bh) **LANGUAGE AND LITERATURE.** The modern Indian language and literature of the Punjab (q.v.). The Panjabi represents, roughly speaking, an archaic dialect of Hindi, supplemented by a large number of loan words from Arabic and Persian, and belongs to the central group of the Indo-Aryan languages. On the other hand, the infusion of Sanskrit loan words (technically called *tatsama*, identical) is small, as compared with the Eastern languages of India, especially Bengali (q.v.) and Uriya (q.v.). Panjabi, like all the Indian languages, has many small sub-dialects, which shade off into each other. The chief of these dialects are Multani in the South, which stands intermediate between Panjabi and Sindhi (q.v.), Jathki in the Centre, and Chibhali-Dogri in the North. There are several alphabets. Of these the oldest is the Gurmukhi, a modification of the Sanskrit Devanagari alphabet (q.v.), with the omission of a few signs. It is in the Gurmukhi script that the Adi-Granth (q.v.) of the Sikhs is written. Next to the Gurmukhi the Lundi, which is employed by the merchant class, deserves mention. The official character of the government, however, is the Arabic, which is the one most generally employed. Panjabi has practically no literature, excepting the Sikh Granths, although the New Testament and parts of the Old Testament have been translated into Multani and Dogri.

Bibliography. Newton and Janvier, *Dictionary of the Panjabi Language* (Lodiana, 1854); Beames, *Comparative Grammar of the Modern Aryan Languages of India* (London, 1872-89); O'Brien, *Glossary of the Multani Language* (Lahore, 1881); Tisdall, *Panjabi Grammar and Reading Book* (London, 1889); Bhai Maya Singh, *The Panjabi Dictionary* (Lahore, 1895); Newton, *Panjābī Grammar* (Ludhiana, 1898); Wilson, *Grammar and Dictionary of Western Panjabi* (Lahore, 1899); Jukes, *Dictionary of the Jathki or Western Panjabi Language* (ib., 1900); O'Brien, *Glossary of the Multani Language or Southwestern Panjabi*, revised by Wilson and Kaul (ib., 1903); Bailey, *Panjābī Grammar as Spoken in the Wazirabad District* (ib., 1904). For a detailed study of the language, consult Sir G. E. Grierson, *Linguistic Survey of India: Western Hindi and Panjābī*, vol. ix, part i (Calcutta, 1908).

PANJAN'DRUM, THE GRAND. An imagi-

nary person in a jumble of nonsense made up by Samuel Foote to test the remarkable memory of Macklin the actor.

PANJIM, pan-zhēn', or NEW GOA. The capital of the Portuguese possession of Goa (q.v.) in India (Map India, B 6).

PANKHURST, CHRISTABEL. See PANKHURST, EMMELINE.

PANK'HURST, EMMELINE (*née* GOULDEN) (1858-). The leader of the militant wing of the English suffrage movement, whose long crusade assures her a permanent place in the social and political history of her time. She was born in Manchester of parents who were advocates of woman suffrage and champions of freedom for the slaves during the American Civil War. Her education she received at private schools in England and at the Ecole Normale in Paris, where she was a roommate of Noémie, the daughter of Henri Rochefort. In 1879 she married Dr. Richard Marsden Pankhurst (died 1898), who was devoted to work for social reform. Five children were born to them. In 1889 Mrs Pankhurst, with her husband, helped to found the Women's Franchise League. Her connection with this and other societies, her work as a Manchester Poor Law Guardian (1874-98), as Registrar of Births (1898-1900), and on the Manchester School Board, gave her valuable practical experience. In 1903 the Women's Social and Political Union was founded at a meeting called by Mrs. Pankhurst and held at her Manchester home. This organization, the headquarters of which was later established in London, whither Mrs Pankhurst moved, had a single aim—the attainment of political equality of women with men. It was destined to become potent and formidable, receiving large contributions (at one meeting, £10,000, at another, £16,000), and employing a salaried staff of more than 100. Mr. and Mrs. F. W. Pethick Lawrence (q.v.) were for some years ardent supporters of the Union.

About 1905 Mrs. Pankhurst and her followers were persuaded that more aggressive methods were necessary. The tactics of "peaceful militancy," pursued for some five years, included recourse to the time-honored custom of heckling public speakers, especially cabinet ministers; the opposing of candidates at by-elections; gigantic processions; deputations and petitions to Parliament, to the Prime Minister, and others; and an ingeniously varied miscellany of sensational

propagandist activities carried on by methods that frequently resulted in disturbances of the peace and brought many women to jail. The fate of the suffrage bills introduced into Parliament up to 1912 was taken by Mrs. Pankhurst and the Women's Social and Political Union as proof that the government had deliberately and repeatedly tricked and betrayed their cause. Although pledges from a majority of members of Parliament to support equal suffrage had been secured, the cabinet was hostile. There resulted a decision to inaugurate a "women's revolution." The suffragette incitements to violence had their effect. Country houses, club-houses, railway stations, lumber yards, grand stands, and churches were fired; race courses and golf links damaged, letters in the pillar boxes destroyed by acid, and bombs exploded. Offenses from window smashing to arson became so common as to bring some thousand women to jail in 1913. In February of that year, Mr. Lloyd-George's country house at Walton having been badly damaged by a bomb, Mrs. Pankhurst was held responsible for the act of her supposed associates. She was tried for inciting to felony and, sentenced to three years' imprisonment, was sent to Holloway Jail. The imprisonment of Mrs. Pankhurst inflamed the suffragettes, because they regarded her as simply a political offender and loudly proclaimed her prosecution a cowardly procedure in face of the fact that Bonar Law and Sir Edward Carson, who publicly incited to violence in Ulster, remained at large and unmolested. Mrs. Pankhurst resorted to the "hunger strike," proclaiming that she would die if necessary, but after a few days she was released in accordance with the provisions of the "Cat and-Mouse" Act, only to be imprisoned again and again. A year from the time of her conviction she had served but three weeks of her sentence. In the summer of 1913 she contrived to visit her daughter Christabel in Paris, whence she sailed for an American lecture tour. This was her third visit to the United States, the two former visits having been in 1909 and in 1910-11. On her arrival in New York on Oct. 26, 1913, she was detained for two days by the immigration authorities at Ellis Island as an "undesirable alien," but she was released by orders from Washington and received a triumphant welcome. Again after her return to England about two months later she was frequently in prison. In the summer of 1914 Mrs. Pankhurst and her associates announced a cessation of militant tactics until the European War should end.

Mrs. Pankhurst's daughters, CHRISTABEL (1880-) and E. SYLVIA (1882-), women of exceptional capacity and energy, took part in their mother's suffrage activity from childhood on. Christabel was educated at the Manchester High School for Girls and at Victoria University, Manchester. In 1906 she took her LL.B. degree with honors, but on the score of her sex was refused at Lincoln's Inn, whence she wished to be called to the bar. It was she who in 1905 really initiated the policy of militancy, and she was three times imprisoned. After 1912 she made her home in Paris, whither she had fled to escape arrest on a conspiracy charge, and where she edited the *Suffragette*, the weekly organ of the Women's Social and Political Union. From October, 1914, to March, 1915, she lectured in the United States. Her *Plain Facts about a Great Evil* (the social evil), which also

appeared with some changes as *The Great Scourge and how to End it*, was published in 1913.

Sylvia Pankhurst, educated in the Manchester schools and at the Royal College of Art, South Kensington, where she won a scholarship, devoted herself to the militant side of the votes-for-women campaign and shared the prison and many other experiences of her mother and sister. In 1911 she lectured in the United States and in the same year appeared her volume *The Suffragette* (New York), which carefully records the "peaceful militancy" of 1905 to 1910. Consult this book; also A. G. Gardiner, *Prophets, Priests, and Kings* (London, 1908, new ed., in "Wayfarer's Library," ib., 1914); Emmeline Pankhurst, *My Own Story* (New York, 1914). See WOMAN SUFFRAGE.

PANKHURST, SYLVIA. See PANKHURST, EMMELINE.

PANKOK, pän'kók, BERNARD (1872-). A German architect, designer, and painter. He was born at Munster (Westphalia) and studied at the academies of Düsseldorf and Berlin. In 1902 he was appointed director of the Royal School of Decorative Arts at Stuttgart. A man of varied activities, Pankok is perhaps best known through his illustrations for the *Jugend*, for *Pan*, and for the *Catalogue of the German Exhibit* at Paris in 1900. As an architect he erected the marriage-contract hall in Dresden, the room for modern paintings in the Stuttgart Gallery, and rooms at various expositions. As a painter he is represented in the galleries at Berlin, Stuttgart, and Schwerin. In the development of modern decorative art in Germany he played an important part.

P'AN-KU, pän'kōō. A mythical being, invented by the later compilers of Chinese legends, said to have been the first development of conscious being out of chaos and the originator of the human race. The original historians say nothing about P'an-ku, but the Chinese names given him in popular speech and in the voluminous mediæval literature seem to mean Embryo, Prince of the Three Powers (of heaven, earth, and man), Son of Heaven, etc. The legends of this reputed first conscious being are greatly embellished, according to the fancy of myth-making writers. After toiling millions of years to bring the earth into shape, he died, and his breath became wind and cloud, his voice thunder, his left eye the sun, his right eye the moon, his teeth and bones metals, his marrow pearls and precious stones, his sweat rain, and the parasites on his body, impregnated by the wind, the human species.

PAN MICHAEL. A novel by Henryk Sienkiewicz (1887). With the novels "With Fire and Sword" and "The Deluge," it completes the great trilogy on the Polish wars of the seventeenth century.

PANMUHOREE. See FENNEL.

PANNA, or **PUNNAH**, pän'ä. A native state of the Bundelkhand (q.v.) Agency, Central India. Area, 2492 square miles. Pop., 193,000. Capital, Panna, pop., about 12,000.

PANNINI, pän-né'né, GIOVANNI PAOLO (c.1695-1768). An Italian architectural painter of the Roman school, born at Piacenza. He was the pupil of Benedetto Luti and Andrea Lucatelli in Rome, and was influenced by Salvator Rosa. He confined himself to interiors and exteriors of buildings, ruins, and monuments in or about Rome and introduced picturesquely arranged

figures and accessories. Grace and dexterity of design, fantastic richness of composition, and masterly rendering of atmosphere distinguish all his works, which include: "Interior of St. Peter's" and "Antique Ruins," in the Louvre; "The Pyramid of Cestius," in the National Gallery, London; "Cardinal Polignac Visiting the Interior of St. Peter's," in the Metropolitan Museum, New York; "The Reception of Benedict XIV.," in the Naples Museum, and many other fine examples in the galleries of Rome, Florence, Naples, Madrid, and Vienna and in private collections in England. He also painted frescoes in the Quirinal and other Roman palaces and villas and was president of the Academy of St. Luca and member of the French Academy. His works have been frequently engraved.

PANNONIA. A province of the ancient Roman Empire, bounded on the north and the east by the Danube and on the west by the mountains of Noricum, and on the south reaching a little way across the Save and thus including part of modern Hungary, Slavonia, and parts of Bosnia, Croatia, Carniola, Styria, and Lower Austria (Map Rome, D 2). It received its name from the Pannonians, a race of doubtful origin, who at first dwelt between the Dalmatian Mountains and the Save, in modern Bosnia, and afterward more to the southeast in Mesia. The Roman arms were first turned against them and their neighbors, the Iapydes, by Augustus in 35 B.C., and after the conquest of Segestica or Siscia (Siszek) he subdued them. An insurrection took place in 12 B.C., which Tiberius crushed after a long struggle. A more formidable insurrection of the Dalmatians and Pannonians together, in 6 A.D., was suppressed by Tiberius and Germanicus, after a two years' struggle. Fifteen legions had to be assembled against the Pannonians, who mustered 200,000 warriors. Hereupon the Pannonians settled in the more northern districts, which received their name, and of which the former inhabitants, the Celtic Boii, had been in great part destroyed in Caesar's time. The country was now formed into a Roman province, which was secured against the incursions of the Marcomanni and the Quadi by the Danube and on its other frontiers had a line of fortresses. Military roads were constructed by the conquerors, who also planted in the country many colonies and municipia and thus gave it a rough coating of civilization. The country was divided by Trajan, during the Dacian wars, into Upper (or western) and Lower (or eastern) Pannonia. Under Galerius and Constantine it underwent other changes. Upper Pannonia was the scene of the Marcomannic War in the second century. In the fifth century Pannonia was transferred from the Western to the Eastern Empire and afterward given up to the Huns. After Attila's death, in 453, the Ostrogoths obtained possession of it. The Lombards under Alboin made themselves masters of it in 527 and relinquished it to the Avari upon commencing their expedition to Italy. Slavic tribes also settled in the south. Charlemagne brought it under his sceptre. In the reigns of his successors the Slavs spread northward, and the country became a part of the great Moravian Kingdom, till the Magyars or Hungarians took it in the end of the ninth century. In the time of the Romans the chief towns of Upper Pannonia were Carnuntum (Petronell), Petovio (Pettau), Siscia (Siszek), Emona (Laibach), Savaria (Stein and Anger), and Vindobona (Vienna); of Lower

Pannonia, Aquineum (Alt-Ofen, or Old Buda) and Sirmium (Mitrovic). Consult the article "Pannonia," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

PAN'NUS. See CONJUNCTIVITIS.

PANO, pñ'nò. A tribe of the Huallaga and Ucayali rivers, northeastern Peru, the nucleus of those constituting the Panoan stock (q.v.). According to their traditions they have emigrated from a northern region. In 1670 the missionary Lucero collected a part of them into a settlement at the mouth of the Huallaga. In 1830 they removed to the mission of Sarayacu on the Ucayali, where they still reside. They are expert boatmen, building canoes of 40 feet in length, and they have a frank, easy, and courteous bearing, but are much given to drunkenness. It is said that they formerly preserved pictograph records painted on paper manufactured from the fibre of banana leaves. They number less than 2000. Consult M. Raoul de la Grasserie, in *Compte-Rendu du Congrès des Américanistes de Paris* (Paris, 1888).

PANOAN (pñ'nò-in) **STOCK.** An important South American linguistic stock, comprising some 20 tribes occupying the immense forest region on the upper portions of the Madeira, Beni, Parus, Javary, Ucayali, and Huallaga, east of the Andes and south of the Amazon, in Peru, Bolivia, and western Brazil. Although apparently of more than average native intelligence, they are almost all in their original savage condition, some of them being even accused of cannibalism. Several of their tribes are light in color. Like most of the peoples of the Amazon region, they are steadily decreasing in number. Among the most important tribes of the stock are the Cashibo, Conibo (q.v.), Mayoruna, Pano, Remo, Senei, Setebo, and Shipibo. Consult Von den Steinen, *Dictionario Sipibo* (Berlin, 1901), and M. Navarro, *Vocabulario Castellano-Quichua Pano, etc.* (Lima, 1903).

PANÓFKA, pñ-nóf'ku, THEODOR (1801-58). A German archaeologist, born and educated in Breslau. He began the important excavations at Nola, Italy, and at the establishment of the Archaeological Institute at Rome became its secretary. In 1844 he was named professor of archaeology at Berlin. His works, which are still valuable for the material collected and for the illustrations, include: *Neapels antiken* (1828); *Musée Blacas* (1830-33); *Bilder antiken Lebens* (1843).

PANORAMA, pñ'nò-rä'má (Neo-Lat., from Gk. *pās*, *pas*, all + *ōpāa*, *horama*, view, from *ōpāo*, *horan*, to see). A pictorial representation of the whole surrounding landscape as seen from one point. It differs from a painting in that the latter only gives part of the landscape and aims at artistic effects, whereas the chief aim of the panorama is optical illusion. The first step in the construction of a panorama is to obtain sketches of the entire region to be represented; each sketch is a representation of a portion of the landscape in the form of a sector of a circle with the sketcher's position as a centre and the horizon for circumference. The canvas to which the sketches are to be transferred is hung round the sides of a circular room and forms the surface of a cylinder, on the inside of which the panorama is painted. The stage from which the picture is viewed is placed in the centre of the room, about 30 feet on every side from the picture; the picture itself is fastened above to

a strong circular hoop and, hanging down, has its lower edge fastened to a similar hoop, which is heavily weighted to keep the picture steady. The light is admitted by an aperture in the roof, which is concealed by an awning from the spectators on the stage.

The idea of a panorama was first conceived by the architectural painter Breisig, of Danzig, but the first to put it in execution was Robert Barker, a painter, who in 1788 succeeded in producing an effective panoramic view of Edinburgh. This was followed by a view of London and scenes from the Napoleonic wars. In 1799 the panorama was taken up in Paris, where it was much improved, and whence it was introduced into other European cities. Its use has greatly increased since the Franco-Prussian War of 1870-71. By the employment of plastic objects in addition to painting, the painter Philippeaux greatly increased the optical illusion, as was seen in his admirable panorama, "The Siege of Paris," exhibited in 1875. He was also employed in the United States on a panorama of the "Battle of Gettysburg," which was exhibited in New York, 1888-91, and afterward in other American cities. Among painters who have attained distinction in painting panoramas were De Neuville and Detaille in France, Ludwig Braun and Anton von Werner in Germany. In recent years many artists of ability have painted panoramas, which have been frequently exhibited in most of the chief cities of Europe and the United States. Consult Bapst, *Essai sur l'histoire des panoramas et dioramas* (Paris, 1891).

PANORMITA, pā'nōr-mē'tā, ANTONIO BEOCADELLI (1394-1471). An Italian humanist, born at Palermo, whence the name Panormita, by which he is commonly known. He was educated at Siena and taught classics at Pavia, Bologna, and Padua. His best-known work was the collection of obscene elegies entitled *Hermaphroditus*, which, though attacked by some of the lesser clergy and condemned by the Pope, won praise from the scholars of the time for its elegant Latinity. In 1435 Alfonso of Naples pensioned him and made him historiographer.

PANORMUS. The ancient name of Palermo (q.v.).

PANPSYCHISM, pān-sī'kiz'm (from Gk. *πᾶς*, *pas*, all + *ψυχή*, *psyche*, soul). A term employed in the history of philosophy to designate the metaphysical theory that the whole of nature, inanimate and animate alike, is endowed with mind or has a mental side or aspect, so that the atom of the physicist, no less than man himself, though of course in immeasurably less degree, is ensouled, and the movements of the atom, no less than the voluntary movements of man, are accompanied by mental process. The name may be applied in ancient philosophy to the Stoic doctrine of *Allbeseelung*, as opposed to the earlier hylozoism, and in modern times to such philosophical beliefs as were held by Thomas Carlyle, still more to such a philosophical system as that of Fechner. Every pantheistic system (see **PANTHEISM**) is also, in a sense, panpsychistic. In particular, certain of the Arabian philosophers, notably Averroës (q.v.), have been termed panpsychists by the historians of philosophy.

PANSA, pān'zā, HOUSE OF. The name given to the ruins of a large dwelling in Pompeii, from an election notice painted on its front wall. The

house is interesting chiefly on account of the regularity of its plan. Although extensive, it contained few large apartments, but was cut up into small rooms, or groups of rooms, and contained a number of shops, including a bakery. No part of the wall decorations is preserved. Consult Mau-Kelsey, *Pompeii: Its Life and Art* (2d ed., New York, 1902).

PANSLAVISM, pān-slāv'iz'm (from Gk. *πᾶς*, *pas*, all + Ger. *Slave*, Slav, from OChurch Slav. *Slovieninu*, Russ. *Slavyaninu*, Slav). The term applied to a movement which contemplates the political and cultural union of all nations of Slavic descent. It had its origin about 1830 and was fostered by the general awakening of the national spirit which characterized the Europe of that time. The movement throughout central Europe was paralleled by the Slavophile movement in Russia which had for its object the regeneration of the country through a return to the old ideas of Russian civilization as they had stood before the Western innovations of Peter the Great. Russia, owing to its predominant position in European affairs under Nicholas I, came to be regarded as the protector of the scattered Slavic peoples living under Austrian, Prussian, or Turkish rule. In 1848 the leading promoters of Panslavism summoned a congress at Prague, which was attended by Slavs from Bohemia, Moravia, Silesia, Serbia, Croatia, Dalmatia, and Poland. Since 1860 Panslavism has exerted direct influence on Austro-Hungarian politics, both northern and southern Slavs tending towards united action in opposition to the Germans and Magyars. In 1867 a great Slavic congress was held at Moscow, but with little material result. It was largely as the natural champion of the oppressed Slavs of the Balkan Peninsula that Russia declared war on Turkey in 1877, and the politics of the peninsula for a few years were influenced to a considerable degree by the ambitions of the Panslavists. An attempt to revive the Panslavic idea was made in 1908, when a second congress of Slavic nations was held in Prague. The initiative in this case was taken by the Czechs and Poles, but the resolutions of the congress in favor of Slavic unity were not carried out. The two Balkan wars as well as the situation in Austria-Hungary prove that the idea of political Panslavism has no prospects of realization. Though the European War of 1914 is ascribed by many to the aggressiveness of the Panslavists, the latter have played a very insignificant part in it. Whatever there is of Panslavism has asserted itself most effectually in the field of literature and more especially in philology, where the researches of many scholars have resulted in laying down the principles for a comparative science of Slavic languages. Consult: Rudolf Vrba, *Russland und die Panslavismus* (2 vols., Prague, 1913); Louis Levine, *Pan-Slavism and European Politics* (New York, 1914); Ernest Ludwig, *Austria-Hungary and the War* (ib., 1915).

PANSY. See VIOLET.

PANTÆNUS (Lat., from Gk. Πανταίνος, *Pantainos*). Teacher of the Christian catechetical school in Alexandria about 180-195. Little is known about him, but he was probably a native of Sicily, trained in the Stoic and Pythagorean philosophy and converted to Christianity in adult life. He was one of the earliest to use philosophy in Christian teaching. His fame rests chiefly upon his work as a teacher, which is described with affectionate admiration by his cele-

brated pupil Clement. (See CLEMENT OF ALEXANDRIA.) Tradition relates that he went on a mission to India, which is not improbable. He is said to have written commentaries on the Scriptures, but none have survived. It has been suggested that he may have written the last two chapters of the Epistle to Diognetus. There is no trace of him after the persecution under Septimius Severus (203). The small fragments ascribed to Pantænus are given in Migne, vol. v, and Routh's *Reliquiæ Sacræ*, vol. i (Oxford, 1846). Consult: Charles Bigg, *The Christian Platonists of Alexandria* (London, 1886); Adolf Harnack, *Geschichte der altchristlichen Literatur*, vol. ii (Leipzig, 1893); C. T. Cruttwell, *Literary History of Early Christianity* (2 vols., New York, 1899).

PANTAGRUEL, *Fr. pron.* pän'tä'gru'él'. The son of the giant Gargantua and the chief character in Rabelais's romance, *Gargantua et Pantagruel*. In the fifteenth-century mysteries the name is given to a demon who throws salt into the mouths of sleeping persons, and Rabelais made the character King of the Dipsodes (thirsty). Like his father, Pantagruel is the hero of various burlesque adventures imitating the exploits of chivalry.

PANTALEON (?-305 A.D.). A Roman saint, physician, and martyr, born, it is supposed, at Nicomedia in Bithynia. He studied medicine and became special physician to the Emperor Galerius. He was a Christian and was martyred as such. He is the patron saint of physicians, and his feast is kept on July 27.

PANTALEON. A large dulcimer, named by Louis XIV, in honor of its inventor, Pantaleon Hebenstreit. The pantaleon was the direct precursor of the pianoforte (q.v.).

PANTELEGRAPH. See CASELLI, GIOVANNI.

PANTELLARIA, pän'tel-lä-rä', or **PANTELLERIA**. A small island in the Mediterranean Sea between Sicily and Africa, belonging to the Province of Trapani, Sicily (Map: Italy, C 6). It is of volcanic origin and has an extinct crater, 2743 feet high, and several hot springs. The soil is fertile, producing grapes, cotton, wheat, and olives, and the harbor on the northwest coast has considerable shipping. Chief town, Pantellaria. Pop., 1901, 8619; 1911, 8873.

PANTENIUS, pän-tä'né-us, THEODOR HERMANN (1843-). A German novelist. He was born at Mitau, Courland, studied theology in Berlin and Erlangen, and for six years taught at Riga, where he also edited the *Baltische Monatsschrift* (1870-76). He lived at Leipzig, was editor of the weekly *Daheim* (1876-1906) and of *Völkchen und Klasings Monatshefte* (1886-1906), and in 1891 followed his journals to Berlin. Pantenius wrote, under the pseudonym of Theodor Hermann, some excellent sketches and novels, portraying life in Lithuania and Courland, such as *Die von Kelles* (1885), *Wilhelm Wolfschild* (2d ed., 1873), *Allein und frei* (1875), *Das rote Gold* (1881), and *Kurlandische Geschichten* (1892); also *Der falsche Demetrius* (1904), a historical monograph. His collected novels were published in nine volumes (Bielefeld and Leipzig, 1898-99). Consult his autobiographical *Aus meinen Jugendjahren* (Leipzig, 1907).

PANTHEISM (from Gk. *πᾶς*, *pas*, all + *θεός*, *theos*, god). The name given to any system of speculation which identifies the universe with God (*acosmism*) or God with the universe.

Pantheism has often been the expression of an intense religious consciousness (as in Spinoza). The term "pantheism" was apparently coined by John Toland in the eighteenth century, but the antiquity of the view it designates is undoubtedly great, for it is prevalent in one of the oldest known civilizations in the world, the Hindu. Yet it is a later development of thought than polytheism (q.v.). Hindu pantheism, as *acosmism*, is taught especially by the Upanishads (q.v.) and by the Vedanta (q.v.). The Hindu thinker regards man as born into a world of illusions and entanglements, from which his great aim should be to deliver himself. Neither sense nor reason, however, is capable of helping him; only through long-continued, rigorous, and holy contemplation of the supreme unity (Brahma) can he become emancipated from the deceptive influence of phenomena and fit to apprehend that he and they are alike but evanescent modes of existence assumed by that infinite, eternal, and unchangeable being who is all in all.

Greek pantheism finds a somewhat inarticulate expression in Xenophanes (q.v.), but comes to full utterance in the writings of the Stoics (q.v.). To the views of Neoplatonists (see NEOPLATONISM) a pantheistic tendency is often attributed, but it is doubtful whether emanationism does not logically escape pantheism.

During the Middle Ages Johannes Scotus Erigena (see ERIGENA) was the most prominent Christian pantheist. Among the Arabian philosophers pantheism was current.

Modern pantheism shows itself in Nikolaus of Cusa (see CUSA) and Giordano Bruno (q.v.). Spinoza (q.v.) comes next among modern pantheists in the order of time, and he is perhaps the greatest, certainly the most rigorous and precise, of the whole class that either the ancient or the modern world has seen. Consult: Jacob, *A Manual of Hindu Pantheism* (Boston, 1881); G. E. Plumptre, *General Sketch of the History of Pantheism* (2 vols., London, 1881); J. A. Picton, *Pantheism: Its Story and Significance* (ib., 1905); also J. E. Erdmann, *History of Philosophy*, translated by W. S. Hough (3 vols., New York, 1892-97). See **BARISM**.

PANTHEON, pän-thē'on or pän-thē-on (Lat., from Gk. *Πάνθεον*, *pantheon*, temple to all the gods, neut. sing. of *πάνθεος*, *pantheios*, relating to all the gods, from *πᾶς*, *pas*, all + *θεός*, *theios*, divine, from *θεός*, *theos*, god). A temple to all the gods; hence, in particular, the greatest of such temples at Rome. The first Pantheon, erected in 27 B.C. by Valerius of Ostia for M. V. Agrippa, was a rectangular edifice behind the Baths of Agrippa. Injured or destroyed by lightning under Trajan, it was replaced in 123 A.D. by the existing circular edifice erected by Hadrian, as is proved by the discoveries of Chédanne in 1892. The porch of 16 superb colossal monolithic Corinthian columns appears to have been built with materials from Agrippa's porch and to have been altered from a decastyle to an octastyle porch, perhaps by Septimius Severus, 202 A.D. The Pantheon was further remodeled by Caracalla; it is possible that the interior paneling of the dome, which offers many puzzling problems, dates from this time and was hewn in the originally smooth vault. The Pantheon is the most perfectly preserved and the noblest work of Roman architecture. It consists of a circular hall, 142½ feet in internal diameter, supporting a dome

rising to a height of 142 feet, and pierced at the summit by an oculus or opening 27 feet in diameter—the only window in the edifice, but wonderfully effective in its effect of interior lighting. Seven niches for statues adorn the interior, which, however, has lost much of its original aspect since the “restorations” of 1748–56. The Pantheon, often called in Rome La Rotonda, has been since 608 A.D. a Christian church. In 663 it was despoiled of its statues and bronze adornments by the Emperor Constans II, and in 1632 the superb bronze vault of the portico was removed by Urban VIII, to be used in casting the baldacchino of St. Peter's Church.

The name Pantheon has been also applied to a number of domical buildings, among which the most important is the church of St. Genevieve at Paris, erected 1764–81 by the architect Soufflot in a somewhat cold but highly elegant and dignified classic style. During the Revolution it was desecrated and dedicated to the great men of France; according to the classic tendencies of the time it was called Le Panthéon and has retained this name ever since. In 1806 it was restored to Catholic worship and reconsecrated; secularized again in 1830, it was once more consecrated in 1851, but has since 1885 served as a secular national mausoleum, for which the greatest French artists have been employed to execute mural decorations of the highest historical and artistic importance. In plan it forms a Greek cross of about 255 feet in width and length, exclusive of the noble portico in front. The dome over the intersection, 70 feet in diameter and rising 268 feet in air, is adorned externally with a superb peristyle of 32 columns.

Isabelle, *Edifices circulaires* (Paris, 1843); Friedrich Adler, *Das Pantheon zu Rom* (Berlin, 1872); Alphonse Gosset, *Les coupôles d'orient et d'occident* (Paris, 1889); R. A. Lanciani, *Ruins and Excavations of Ancient Rome* (Eng. trans., Boston, 1897). For illustration, see **DOME**.

PANTHER (OF. *pantere*, *panthere*, Fr. *panthère*, from Lat. *panthera*, *panther*, from Gk. *πάνθηρ*, *panthēr*, *panther*; perhaps connected with Skt. *pundarika*, tiger). 1. The leopard (q.v.). Sportsmen use the term rather loosely, although some attempt to distinguish the large, more uniformly colored specimens by this name. 2. In the United States, the puma. The name was more common in early days than at present and more often heard in the dialect corruption, *painter*, than in its true form. See **PUMA**.

PANTHER CAT. The ocelot (q.v.).

PANTHER COWRY. An Oriental cowry (*Cypræa pantherina*), red brown, densely spotted with blackish. See **COWRY**, and Colored Plate of **GASTROPODS**.

PANTHER TOAD. A large smooth-skinned toad of northwestern Africa, which has the upper parts adorned with a pattern of dark-edged, reddish-brown patches upon a yellowish ground, and the underparts white. This beautiful species is noted for the ease with which it may be tamed. A very similar species is to be found all over Central and South Africa. The former is *Bufo pantherina* and the latter *Bufo regularis*.

PANTICAPÆUM. The ancient name of Kertch (q.v.).

PANTIN, pân'tân'. A town of France in

the Department of Seine, situated northeast of Paris just outside the fortifications. It has sugar refineries and manufactures railway cars, boilers, chemicals, perfumes, glass, and oilcloth. Pop., 1901, 29,716; 1911, 36,350.

PANTOGRAPH (from Gk. *πᾶς*, *pas*, all + *γράφειν*, *graphein*, to write). An instrument used to make an outline copy of a map, design, drawing, or other picture either at the same scale or larger or smaller. It consists of four rods so joined as to form a parallelogram. One of the rods is pivoted about a fixed axis, while the apparatus is supplied with a tracer or point which is moved over the original drawing and a pencil which makes the line of the copy. A form of the pantograph which is extensively used is shown in the illustration. The rods are jointed at *a*, *b*, *c*, and *d*, so that *ab* is equal to *cd* and *ac* to *bd*, thus making the figure *abcd* a parallelogram. At *d* and *f* are the tracing point and pencil respectively, while at *e* the rod is pivoted so as to move freely. The points *e*, *d*, and *f* are in a straight line, which is maintained no matter how the framework is moved about *e*. The triangles *bed* and *acf* are similar, and the distance traversed by the point *f* with respect to that traversed by *d* will depend on the ratio of *ac* to *af*. It is of course possible

SIMPLE PANTOGRAPH.

to interchange *f* and *d*, and in that case there will be a reduced drawing made. By means of screws or pins at *b* and *c* the ratio of the sides of the parallelogram and the scale of reduction may be altered to suit the artist, the appropriate scale being marked on the arms. There are several forms of pantographs and instruments in which numerous refinements in the way of rollers, pivots, suspenders, etc., are introduced. Its invention is ascribed to Christopher Scheiner, a Jesuit priest, in 1603, and a description of the instrument was published at Rome in 1631. Consult J. B. Johnson, *Theory and Practice of Surveying* (17th ed., rewritten by L. S. Smith, New York, 1910).

PANTOJA DE LA CRUZ, pân-tô'hâ dâ là krôoth, JUAN (1551–c.1609). A Spanish portrait and historical painter, born in Madrid. He was a pupil of Sanchez Coello, whom he succeeded as court painter to Philip II. He continued in that position under Philip III and repeatedly painted the portraits of both these monarchs, besides those of many other members of the royal family. His style resembles that of his master, and their work is frequently

confounded, but Pantoja exaggerated Coello's faults and is more remarkable for care and finish than for vigor and freedom. He also painted some fine altarpieces. In the Madrid Museum may be seen a "Birth of the Virgin," a "Nativity," besides portraits of Charles V (2), Philip II, Queen Isabel de Valois (2), and others; in the Pinakothek at Munich the portraits of Archduke Albrecht (1600) and his consort Isabella (1599), and in the Vienna Museum portraits of the Infanta Anna and the Infante Philip.

PANTOMIME (Lat. *pantomimus*, from Gk. *παντομιμος*, one who acts by dancing and dumb show, all-imitating, from *πᾶς*, *pas*, all + *μιμος*, *mimos*, imitator, from *μιμεῖσθαι*, *mimēisthai*, to imitate). The art of dramatic representation without words, through expression by attitudes and gestures. Among the Romans the term *pantomimus* was applied to the actor himself. Whether pantomimic performances had a distinct existence under the Republic it is hard to say, but Augustus showed great favor to this kind of entertainment, which seems to have arisen from the older custom of separating the actor and the reciter of dramatic dialogue; the fact also that in the great open theatres the Roman public could see much more easily than it could hear probably contributed to the popularity of mute acting. As the *pantomimi* wore masks, no facial mimicry was possible; everything depended on the movements of the body. There was, however, commonly at the rear of the theatre, a choir, which sang the story by way of interlude or accompaniment; and as the subjects presented in dumb show were chiefly mythological love stories, they were consequently well known to the spectators. The earlier *pantomimi* came singly upon the stage, acting successively all the characters involved in the story; later several appeared together. The most celebrated *pantomimi* of the Augustan age were Bathyllus (a freedman of Mæcenas) in comedy and Pylades and Hylas in tragedy. The class soon spread over Italy and the provinces and became so popular with the Roman aristocracy, who used to invite male and female performers to their houses to entertain their guests, that Tiberius thought it necessary to check the vanity of the *pantomimi* by issuing a decree forbidding the senators to go to their houses and knights to be seen walking with them on the streets. Under Caligula they were again in favor, and Nero even went the length of acting in a pantomime. From this period the *pantomimi* enjoyed unbroken popularity so long as paganism held sway in the Empire.

Pantomimic elements have always been found in the popular theatres, notably in the early Italian *commedia dell' arte*, in which were developed the characters of Harlequin, Pantaloon, Columbine, and the rest of their familiar troupe. In France in the seventeenth and eighteenth centuries the word "pantomime" was applied to a kind of mythological spectacle at the Opéra, in which allegorical characters appeared in appropriate costumes. The great *ballets d'action* of Noverre were really pantomimic in character. In the first half of the nineteenth century, at the famous little Théâtre des Funambules in Paris, pantomime enjoyed for some years a remarkable revival under the genius of Debureau and his associates.

In England the first pantomime is said to have been produced at Drury Lane in 1702. It

was *The Tavern Bilkers*, by a dancing master named John Weaver, another of whose pantomimes, *The Loves of Mars and Venus*, had a remarkable success. But it is to the noted harlequin John Rich that the establishment of the familiar Christmas pantomime is generally credited. In December, 1723, he brought out at Lincoln's Inn Fields *The Necromancer, or the History of Dr. Faustus*, by way of rivalry to *Harlequin Dr. Faustus*, which had been produced at Drury Lane not long before. Pantomimes were not then, however, limited to the Christmas season, but were regarded, as they have sometimes been since then, as a means for filling the theatre's treasury and supplementing the attractions of the legitimate drama. English pantomime was further developed by the coming in 1758 of the Grimaldi family. Joseph Grimaldi (q.v.), who was born in 1779, was especially clever at inventing tricks and devising machinery. *Mother Goose* and others of his harlequinades were long popular. A special feature in the early part of the last century was the "transformation scene," in which was made the change of characters to the harlequinade proper, or latter part of the programme. The subjects of these pantomimes have been generally found in popular tales like those of Aladdin, Blue Beard, Cinderella, or Little Red Riding Hood.

In America, up to the present century, pantomime made only sporadic appearances and was insignificant in dramatic history. The success of such a piece as *Humpty Dumpty* (1870), with George Fox as clown, was a rare exception to the rule. The twentieth century, however, was to witness in its early years an extraordinary development and a world-wide vogue of pantomime in the form of the moving picture or photoplay, which is really pantomime seen as it were in a mirror, the actors in this latest dramatic novelty relying entirely, in true pantomimic fashion, upon movement, gesture, attitude, and facial expression to tell the story of the drama in which they are cast and to reveal the emotions of its dramatic personae.

Consult: Isaac Disraeli, "The Pantomimical Characters," in *Curiosities of Literature* (12th ed., London, 1841); Champfleury (pseud.), *Souvenirs des Funambules* (Paris, 1859); Ludwig Friedländer, *Darstellung aus der Sittengeschichte Roms* (Leipzig, 1890); R. J. Broadbent, *A History of Pantomime* (London, 1901); Otto Driesen, *Die Ursprung des Harlekin* (Berlin, 1904). See BALLET: HARLEQUIN; MIME; ETC.

PANTOPODA (Neo-Lat. nom. pl., from Gk. *πᾶς*, *pas*, all + *πούς*, *pous*, foot). An aberrant group of arthropods, which seem to stand nearer the Arachnida than any other class. They are

A TYPICAL PANTOPOD, OR "NO-BODY CRAB."

spider-like in form, with very long slender limbs arising from a remarkably small body, whence they have been called "no-body crabs." Each of the four pairs of legs contains a long caecal pro-

longation of the stomach. The body consists of a cephalothorax, consisting of an anterior proboscis, succeeded by three segments, and one thoracic segment, behind which are three free thoracic segments and a minute rudimentary abdomen. To the cephalothorax are attached four pairs of appendages, one or both of the first two of which may end in a forceps. These are succeeded, in the male alone, by a pair of vigorous legs and the first pair of thoracic legs, while each of the three free thoracic segments bears a pair of very long legs; there are thus in all seven pairs of appendages. The animal breathes through the walls of the body, and, as in all marine arthropods, there are no urinary tubes. In most of the forms there is a slight metamorphosis, the larva having three pairs of appendages. In one form the larvæ are internal parasites in certain hydroids. These sea spiders live at various depths from between tide marks to deep water. The group was formerly named Pycnogonida. By some authors they are supposed to be allied rather to Crustacea than to Arachnida, having one more pair of limbs than any arachnid.

PÁNUCO, pá'nū-kō. A river in Mexico, rising by several head streams on the Mexican Plateau and flowing northeastward to the Gulf of Mexico. In its lower course it forms the boundary between the states of Tamaulipas and Vera Cruz. With the construction of the jetties the bar at its mouth has been removed, and it is now accessible to steamers of 24-foot draft. Tampico (q.v.), at its mouth, is now one of the most important ports in Mexico. The famous drainage canal of the valley of Mexico empties into a tributary of the Pánuco.

PANUM, pi'nūm, PETER LUDWIG (1822-85). A Danish pathologist, born at Ronne, Isle of Bornholm. He studied medicine at Kiel and Copenhagen. His government sent him in 1846 to the Faroe Islands to treat an epidemic of measles. Returning to Copenhagen, he practiced there until 1850, though taking part meanwhile in the war of 1849. In 1850, by government appointment, he went to Bandholm (Laaland) to suppress the cholera. Panum in 1851 became a member of the medical faculty of the University of Copenhagen, to which, after a period as assistant professor of pathology at Kiel, he returned in 1863 as professor of physiology. His important works include *Experimentelle Untersuchungen zur Physiologie und Pathologie der Embolie, Transfusion, und Blutmenge* (1864), which established his reputation, and *Haandbog in Menneskets Physiologi* (5 vols., 1865-72). With Key, of Stockholm, he founded and edited *Nordisk Medicinsk Arkiv* (Stockholm, 1869 et seq.).

PANURGE, pi'nūrh'. An important character in Rabelais's *Gargantua et Pantagruel*. He is discovered by Pantagruel at Paris and becomes his friend.

PANY'ASIS, or **PANY'ASSIS** (Lat., from Gk. Πανύσιος) (?-c.454 B.C.). A Greek epic poet of Halicarnassus; a relative, probably an uncle, of Herodotus, the historian. He was put to death by Lygdamis, the tyrant of Halicarnassus, for assisting his native town in a fight for freedom. He was the author of a poem in 14 books and 9000 verses, entitled *Heraclea* (*Exploits of Heracles*), which led the critics of the Alexandrian school to rank him among the five great epic poets. According to Suidas he was also the author of *Ionica* (Ἰωνικά), an elegiac poem of 7000 lines on the history of Neleus, Codrus, and

the Ionian colonies. The fragments have been edited by Tzschirner (1842), and by Kinkel in the *Epicorum Græcorum Fragmenta* (1877). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

PÄNZER, pän'tsēr, GEORG WOLFGANG (1729-1805). A German bibliographer. He was born at Sulzbach, studied theology at Altdorf, and lived at Etzelwang, a suburb of Nuremberg, and in that city as pastor and author. He was for several years director of the city library and wrote: *Geschichte der römisch-katholischen deutschen Bibelübersetzung* (1781); *Entwurf einer Geschichte der deutschen Bibelübersetzung M. Luthers von 1517-81* (1783); *Annalen der altern deutschen Litteratur* (1788); *Älteste Buchdruckergeschichte Nürnbergs* (1789); *Annales Typographici* (1793-1803), a valuable catalogue of the old prints of all countries (down to 1536), in 11 volumes.

PAOAY, pā'ō-y'. A town of north Luzon, Philippines, in the Province of Ilocos Norte. It lies near the west coast, on a small lake of the same name, 13 miles south of Laoag. Pop., 1903, 12,743

PAOLA, pā'ō-lā. A city and the county seat of Miami Co., Kans., 44 miles by rail south by west of Kansas City, on the St. Louis and San Francisco, the Missouri Pacific, and the Missouri, Kansas, and Texas railroads (Map: Kansas, H 5). It is the seat of the Ursuline Academy for Girls and has a public library. The city is in a productive farming and stock-raising country, rich also in natural gas. There are flour and feed mills, brick and tile works, and a radiator factory. Paola was first settled in 1855 and in 1869 was chartered as a city. The water works are owned by the municipality. Pop., 1900, 3144; 1910, 3207.

PAOLA, SAINT FRANCIS OF. See FRANCIS OF PAOLA.

PAOLI, pi'ō-lē, CESARE (1840-1902). An Italian historian. He was born at Florence, where he was employed in the record office in 1861, was connected with the archives of Siena in 1865-71, and then returned to Florence, where in 1874 he became professor of paleography and diplomacies at the Istituto di Studi Superiori. In 1887 Paoli became editor of the *Archivio storico italiano*, to which he contributed largely.

PAOLI, PASQUALE (1725-1807). A Corsican patriot, born at Morosaglia. His father, having taken a leading part in the insurrection against the Genoese, was obliged to flee to Naples in 1739. There Paoli received an excellent education. In July, 1755, he was summoned to Corsica and elected captain general of the island and the chief of a democratic government. He energetically and successfully applied himself to the reformation of the barbarous laws and customs of the island and at the same time to the expulsion of the Genoese, who lost in a short time nearly all their strongholds. The fleet of the Genoese was also defeated, and they were obliged to seek help from France. Finally, in 1768, Genoa ceded the island to France. Paoli refused all offers of the French government and continued to struggle for the independence of his country, but was defeated by the superior force of the Count de Vaux, and the French became masters of the island. After continuing the vain struggle for a year Paoli was compelled to take refuge on board a British frigate, in which he sailed for England, where he was well

received and granted a pension by the King (1769). Twenty years afterward the French revolution of 1789 recalled him to Corsica as lieutenant general and military governor. Subsequently, when the island became a department, he was made President of the administration and commander of the National Guard. After the execution of Louis XVI and the bloody scenes of 1793, Paoli's attitude towards the Revolution changed. With the active sympathy of England he organized in 1793 a revolt against the Convention. He was proscribed by that body and made general in chief and President of the Council by a *Consulta* which assembled at Corte. He now openly allied himself with Great Britain and favored the landing of 2000 British troops on the island in 1794, with whose aid he drove out the French. He was forced, however, to surrender the island to the English. Disappointed in his hope of being made Viceroy and finding his influence over the Corsicans gone, he retired from the island in 1796 and spent the remainder of his life in England, where he died near London, Feb. 5, 1807. In 1889 his body was removed to Corsica and there buried with great honor and solemnity. The earliest account of Paoli is found in James Boswell, *Account of Corsica* (Glasgow, 1768). Consult also Arrighi, *Histoire de Pascal Paoli* (Paris, 1843), and Bartoli, *Histoire de Pascal Paoli* (new ed., Bastia, 1891).

PAOLO VERONESE, pa'ô-lô vâ'rô-nâ'zâ. See VERONESE, PAUL.

PAOMBONG, pa'ôm-bông'. A town of Luzon, Philippines, in the Province of Bulacân, on the Pampanga River, 2 miles west of Malolos. Pop., 1903, 8554.

PAOTINGFU, pa'ô-ting'fôo (locally abbreviated into *Pao-fu*). A walled departmental city of China, capital of the Province of Chili. It lies about 80 miles southwest of Peking and 76 west of Tientsin, it is connected by rail with Peking, being an important station on the Lu-Han Railway from Peking to Hankow (Map China, L 4). The city contains several old temples, a Mohammedan mosque, a university, and several very good streets with well-filled shops, including a very large number of curio and book shops. The city was occupied by the allied troops during the Boxer Rebellion on Oct. 19, 1900.

PÁPA, pa'pô. A town in the County of Veszprém, Hungary, situated on the Tapoleza, about 60 miles southeast of Pressburg (Map Hungary, E 3). It has an extensive palace of the counts of Esterházy with a park gate brought from the Tuileries at Paris, a house in which Matthias Corvinus lived, three monasteries, and a Protestant Gymnasium. The manufactures include pottery, tobacco, and textiles. Pop., 1900, 17,426; 1910, 20,150, chiefly Roman Catholic Magyars.

PAPACY (OF. *papacie*, from ML *papatia*, papal office, from Lat. *papa*, pope, bishop, father). The see of Rome considered as an historic institution, claiming to be the head of and centre of unity for the whole Christian Church. The origin of the primacy of Rome is, according to the Roman tradition, to be found (1) in the leading part played by the Apostle Peter in the New Testament records, and (2) in the alleged historic fact of a residence of Peter at Rome as head or bishop of the Christian community there. On the first basis is constructed a theory of a divine commission given to Peter by Jesus

Christ, in virtue of which Peter was invested with the three attributes of king, priest, and teacher over all the followers of his master. On the second basis the Roman church has built up its practical earthly structure of influence and power. The identification of the Petrine idea with Rome was needed to localize and make concrete the abstract claims of a divine commission. Whatever powers were conveyed to Peter by Jesus Christ were now held to be continued in full measure to his duly appointed successors in the Roman bishopric. Although a majority of Christians reject both the Roman interpretation of the Petrine commission and the historical proof of a "bishopric" of Peter in Rome, and still more emphatically deny any connection whatever between these two sets of ideas, the historian finds abundant explanations of the origin and growth of the Roman supremacy without resorting to these sources. Doubtless the tradition of an apostolic origin was a powerful aid to the bishops of Rome in establishing their claims to supremacy.

The Roman community was certainly one of the earliest Christian foundations. It enjoyed the prestige of the work and of the martyrdom of the great Apostles, Peter and Paul. It was the centre of life of the vast Roman Empire and the focal point towards which all ideas streamed in and from which they were redistributed in effective form. Rome, however, had never been an important source of ancient culture. Her gifts to the world were law and administration; her culture was always a borrowed one. This same tradition of practical administrative skill was now to be continued by the Church. The authentic records of Roman Church life during the first two centuries are few, and many instances of the exercise of papal power at this time are not to be found.

The evidences of an aggressive, dominating jurisdiction appear very clearly in the administration of Victor I (193-203). This active and zealous churchman was bent upon securing uniformity in the outward practices of the Church, and he made the existing variations in the time of celebrating Easter a test question. He demanded of the Eastern churches agreement with the Roman Easter period and threatened them with excommunication if they refused. Excommunication, as the refusal to share Christian fellowship with an offending brother, was the right of every church, but we distinctly see here the Roman practice of treating it as a punishment to be inflicted by a superior for disobedience. Irenæus, Bishop of Lyons, himself a Syrian, but in agreement with Victor on the Easter question, admitted the *potentior principatus* of Rome, a phrase naturally quoted by Roman controversialists to support their claims of right. They also cite, as justification of these claims, a letter of Clement I to the Corinthians (95 or 96 A.D.), the epistles of St. Ignatius, and passages of Tertullian, Origen, and other Christian writers of the second and third centuries. Whatsoever may be the value of these testimonies, as cited to sustain the claims of papal supremacy in these early ages, the subsequent fact of a papal domination is outlined distinctly in historical perspective by the end of the fourth century.

The Western world turned as naturally to Rome in religious as in secular matters, partly as the result of the habit of centuries, partly because there was no other resort. Papal Rome

met the demand with a steadiness and prudence worthy of the great ecclesiastical tradition to which she was succeeding. In matters both of faith and practice she was always to be found on the side of a staunch but liberal orthodoxy. While Gnostics on the one hand and Montanists on the other were trying to make of the Church a select esoteric community of the specially initiated, Rome steered carefully between the extremes and lent all her weight to the "Catholic" or universal idea of the Church, as the medium of salvation for all men. On the vexed questions of heretical baptism and ordination and the treatment of the "lapsed" her position was always moderate and liberal. While the theologians of the Eastern world were speculating with philosophical refinements over the great Christian problems, the Roman church quietly but persistently held fast to the idea of a mystery of redemption not to be solved by any human philosophy, but to be accepted once for all by an act of faith. When, in the storms of the Germanic invasions, the weak and cowardly emperors deserted Rome, the Roman bishops repeatedly stood forward in their place and dealt with the invaders in the name of a power greater than their own.

The earliest point at which we can clearly discern the existence of a well-developed organization of papal power is in the administration of Leo I (440-461). He grasped, as none of his predecessors had done, the vast range of his opportunity. He aimed to establish, both in the East and in the West, a system of papal vicariates through which the Roman jurisdiction could be enforced and the Roman forms of faith and practice maintained. Eastward from the Adriatic his success was only partial and temporary. The pressure of Greek Christianity backed by the forces of the Greek Empire was too great, and we may from this point practically dismiss the East from our view. At the Council of Chalcedon (451) the formula of faith presented by Leo became an authoritative statement of the Christological problem. In Gaul the rising metropolitan power received a serious check in Leo's severe treatment of Hilary of Arles, who had on insufficient evidence deposed Chelidonius, Bishop of Besançon. In 452 Leo went out, armed with none but spiritual weapons, to meet the terrible Attila and actually turned him back in the full tide of victory. In 455 he again faced a Vandal invasion from the south and succeeded in gaining at least milder terms for the doomed capital.

Especially clear does this Roman leadership appear in the dealings with those Germanic peoples who for a longer or shorter time occupied the soil of Italy and organized there an actual administration of government. The popes of this period, nominally subject to the emperors at Constantinople, never really questioned the de facto sovereignty of the barbarian rulers in Italy. With Odoacer (476-493), and then with Theodoric the Ostrogoth (493-526), we find them in relations of friendly temporal subjection. Many cases of papal privilege and several disputed elections were referred to these barbarous and heretical chiefs of tribes, and their decisions were accepted. It was the wise policy of Rome at this early stage to conform itself to actual conditions and make its profit out of them. This de facto allegiance was readily transferred to Constantinople when, after the death of Theodoric, the armies of Justinian under Belisarius

and Narses finally drove the Ostrogoths out of Italy (535-553). This revival of Byzantine sovereignty was, however, the most serious disaster that could have happened to the papal idea. Again and again popes were made to feel the rough hand of the Empire if they ventured to act against its will, even on a matter of doctrine. The prestige of Rome was in danger of disappearing if she were to become merely one among the numerous patriarchates under the fitful dictation of Constantinople. It was really an advantage when the dreaded Lombards swarmed over into the Po valley (568) and rapidly drove the Byzantine garrisons from most of the country east of the Apennines. The Lombard terror forms the background of the papal history for nearly 200 years, but it was one of the means through which the importance of the papal institution was recognized and justified.

These were the conditions under which Gregory I the Great (590-604) came to power. From his correspondence we gain for the first time a clear impression of the economic side of the papal administration. We find a considerable total of landed properties scattered from Africa, through Sicily and Italy, to Gaul, managed directly by papal agents and serving as the chief financial basis of the Roman bishopric. Gregory, a prudent manager and astute politician, knew how to keep on good terms with the Empire and even succeeded in making some impression on the Arian Lombards in the direction of their ultimate conversion to Catholicism. He kept up an active correspondence with the Catholic Merovingian princes of the Franks and was the originator of the conversion of the heathen Anglo-Saxons to Roman Catholic Christianity. In a spirit of wise charity for all human diversities Gregory I laid the foundations for a papal system which would have made the Roman bishop the guide and harmonizer of Western Christendom. As time went on, the hold of the Eastern Empire upon Italy became weaker and weaker. In vain popes implored emperors for help against the Lombards. The Mohammedan conquest absorbed all the energies of the declining Empire, and Rome must turn elsewhere for the material support it needed. Gregory's relations with the Franks gave the clew for the future. So long as the Merovingian dynasty lasted nothing could be done; but when the new and vigorous house of Pepin began to displace the Merovingian princes, the opportunity came. Papal appeals to Charles Martel (Major Domus, 714-741) were flatly refused, but his son, Pepin, needing a sanction for his usurpation of the Kingdom, found it worth while to win this of Rome as the price of deliverance from the Lombard terror. More than this, he guaranteed to the papacy the temporal sovereignty over an ill-defined stretch of territory including Rome and a considerable surrounding country. See PAPAL STATES for the subsequent history of the temporal sovereignty.

With the coronation of Charles the Great as Roman Emperor by Pope Leo III (800) a new phase of the papal power begins. The revival of the Imperial name was doubtless intended to connect the actual domination of the Frankish people with the traditions of the ancient Roman world. It was, however, to be several generations yet before the importance of this new connection was to be evident. No emperor from Charles to Otho the Saxon held a position that could in any sense be called Imperial.

Even the title disappeared for more than a generation before Otho. Meanwhile the papacy kept on quietly developing the constitution under which it was to do its great work. The administration of Nicholas I (858-867), coincident with the notable rise of intellectual culture in West Francia, serves to indicate this progress. Nicholas I was keen to seize every occasion to assert papal right of supreme jurisdiction. 1. As defender of a sound Christian morality he took up eagerly the cause of Theutberga, the rejected wife of King Lothair II of Lorraine, and carried it against the support of the fighting men and the whole clergy of Lorraine to a complete triumph. 2. He assailed the metropolitan power in the person of the great Archbishop Hincmar, the most important prelate in the North, on the old question of the right of a subordinate clergyman disciplined by his local superior to appeal directly to Rome.

With the tenth century we find the papacy in a phase which seemed at times to imperil all it had gained. Its three functions—the bishopric of Rome, the government of a Roman state, and the headship of Latin Christianity—were often in hopeless conflict, but never more than now. In the furious strife of local parties in which Rome, like every other Italian city, was involved, the papacy came to be hardly more than the spoil of party victory. Candidates of every variety of incapacity and unsuitableness were set up by rivals in politics, and, even if they succeeded in maintaining their hold upon the bishopric and the Roman territory, there was little question of any influence upon the movement of affairs outside this field. It is the most convincing proof of the need in that age of some such central religious authority in Europe that men continued to pay deference to an institution so careless of its own credit and its own future.

Two causes were destined to bring the papacy once again into the great currents of European Christianity. The first of these was the renewal of the Empire on a German basis. The entrance of the Saxon people into the Latin-Christian culture (c.830) resulted in a great strengthening of the purely German as distinguished from the half-Romantic elements of the Western world. In 919 the German kingship passed with Henry I into Saxon hands. His son, Otho I (937-973), took up the Kingdom, no longer as a Saxon thane, but as the born King of all Germans, and after 25 years of varying success saw his idea of kingship fairly realized. For nearly 40 years the Empire had gone begging for a power strong enough to come and take it. In 961 Otho crossed the Alps as of right and in 962 was crowned Emperor at Rome by Pope John XII, whom he soon uncanonically deposed on accusations of every possible iniquity. He then caused the "election" of a capable Roman layman, Leo VIII, and maintained him with his sword. He bound the clergy and nobility of Rome by solemn oaths to elect their popes in future "canonically" and to seek for such election the approval of the Emperor. Thus it was thought to establish a formal balance of rights between these two branches of the highest earthly power. If the papal sanction be needed to make the Emperor, no less should Imperial approval be necessary to a valid papal election. But no sooner was the Imperial camp removed from Rome than all the evils of local factional strife

broke out again. To end the perpetual conflict, Otho III (983-1002), a youth of generous enthusiasms, tried the experiment of a Roman residence in conjunction with a German pope, Gregory V, of his own making. For a moment the problem seemed solved, but a new outbreak of Roman fury drove him from the city to his death.

Meanwhile the Church was developing a new energy through the force of its monastic principle, the second cause alluded to above. The monastery of Cluny in Burgundy began from its foundation about 910 to exercise an influence upon clerical life quite without precedent. This took the form of a purification of the priestly office by ridding it of the frequent vice of simony and by strictly enforcing the rule of priestly celibacy. The reaction of this movement upon society at large is seen in the efforts to bring about the peace of the land known as the "Peace of God" and the "Truce of God." In all this great activity the papacy as such took no part, but the time came when these ideas took possession of it and made it do their bidding.

The two processes we have noticed—the rise of the Empire and the purification of the Church—come together in the middle of the eleventh century. Another period of papal depression had followed the work of the Othos, and once more the papacy became the prey of contending local factions. The office was tossed about in shameless "deals" or by open violence. In the year 1046 three persons were claiming the papal power on different grounds. The scandal was too great, and the "Romans" appealed to the Emperor Henry III. In the Synod of Sutri (1046), held on the borders of the Roman territory, Henry brought about the removal of all three claimants and nominated a worthy German prelate who was accepted by the Romans. Two other Germans, also nominated by the Emperor, followed in rapid succession. The last of these was Bruno, Bishop of Toul in Lorraine, who, as Pope Leo IX (1049-54) and under the guidance of the monk Hildebrand, began the aggressive policy of Church reform through papal action, which is the most important feature of papal history for the next century. Though nominated by the Emperor, Leo saw plainly that to succeed he must be free from all outside control and rely upon the old Roman traditions. He began his administration by a journey to France and Germany, where in two synods, at Rheims and at Mainz, he proclaimed the articles of the Cluny programme, especially that against simony, and demanded the allegiance of the Northern prelates in his crusade against these evils. The conscience of Europe, roused already by the work of the monastic reformers, responded with satisfactory readiness. At Rome Leo IX found himself involved in an entirely new political situation. The Northern conquerors of southern Italy had reached a point in their expansion where it was important for them to have a definite legal status. They threatened to encroach upon the papal territory and actually routed the Pope's army in the battle of Civitate (1053). But the wisdom of Leo turned this rout into a victory by persuading the Normans to become the vassals of the holy see on condition that their power within certain limits should be recognized as a legitimate sovereignty.

The sense of papal right as paramount is

seen still more plainly in the action of Nicholas II (1058-61). To check the disorders consequent upon the papal elections and to establish the electoral process on a firm and permanent basis, he procured the passage at the Synod of 1059 of a decree whereby the election of the Pope was henceforth to be in charge of the Roman "cardinals," including members from all three clerical orders. The initiative was to lie with these, but they were then to procure the assent of the "Roman people," and a certain undefined right of participation was reserved to the Emperor. On these three elements—the Roman cardinals, the Roman people, and the Roman Emperor—rested the papal constitution for the next 200 years. The greatest conflicts of this period arose from attempts to define more precisely the limits of each element. On the whole, the cardinalate gained steadily upon the other factors and succeeded ultimately in winning exclusive control, not, however, without some decisive modifications in its own make-up.

The papacy was now definitely committed to the work of reform. The influence of Hildebrand grows more and more perceptible. Under his far-seeing direction what had been started as a purely moral movement becomes in the clearest sense a political one as well. Adding to the two articles of the Cluny programme a third—the prohibition of lay investiture—he combined all three under the one general demand for the "freedom of the Church" from all external control. 1. The celibacy of the secular clergy was to be the guarantee that the clergy should be free from all the obligations arising from marriage and the social and economic duties that attend it. 2. The abolition of simony was to make the clergy free from all the complications of worldly interest that must arise if clerical office were to be bought and sold for any valuable consideration whatever. 3. The prohibition of lay investiture was to free the clergy from any relation towards the state which might interfere with the exclusive control of all clerical interests by the supreme ecclesiastical authority, the papacy itself. The effect of the first was to separate the priest from the family; of the second, to separate him from the temporal interests of the society about him; of the third, to cut him off from any secular service to the state. It was "freedom" in the sense of a separation that must tend to place a gulf between the clergy and all purely secular interests. On the other hand, it is doubtful if any other process could have stayed the progress of a fatal secularization of the Church that threatened to absorb it entirely in the life of the society of the full feudal period.

As to the question of simony, all thinking men were agreed that it was an evil. The celibacy of the clergy in the major orders was already well established in the habits of most of the European populations, and the sympathy of the masses was decidedly setting towards its extension to the minor orders as well. It was therefore a well-considered policy that led Hildebrand from the moment of his accession as Pope Gregory VII (1073-85) to throw his whole energy into the fight against the lay investiture.

The moment chosen for the conflict with Germany was most favorable. Henry III, the vigorous champion of Imperial right and duty as the guardian of papal honor, died in 1056,

leaving a son, Henry IV, six years old, who was accepted as King under the regency of his pious mother, Agnes of Poitou. In 1073 this son was a clever, headstrong youth of 23, already at odds with many parts of his Kingdom, but prepared to press to the utmost all his royal rights. The first proclamation against lay investiture was in 1075 and, though couched in general terms, was plainly aimed at Germany. To give up the right of investiture would have meant for the German King the loss of the most important means of political control, and Henry threw himself upon the loyalty of his clerical subjects. A German synod at Worms (1076) denounced the Pope in unmeasured terms and threatened him with deposition. He replied by excommunicating the King, whose political enemies utilized the excommunication as a weapon to keep him in a semi-imprisonment until Gregory could carry out his purpose of settling the whole German question in person at a German assembly. Gregory was on his way to this meeting at Augsburg when Henry IV, leaving Germany, hurried over the Alps, met the Pope in the famous interview at Canossa, and won from him the absolution which reinstated him in the allegiance of his subjects and thus averted the grave political danger of a settlement of German affairs by a papal council on German soil. Through the long reign of Henry IV, under Gregory and his successors, the fight went on. The Pope repeatedly excommunicated the King and sanctioned the election of antipopes. The King replied in virtue of his Imperial rights, actual or to be, by "deposing" popes and causing the election of a series of antipopes. The immediate question of the investiture was lost sight of in the larger issue—whether church or state was to control. Henry V (1106-25) had joined the papacy against his father, but was no sooner King himself than he was forced into an opposition as much more dangerous as he was more powerful. In 1111 he was able to force the papacy into a momentary agreement that the clergy of the Empire should be exempt from the Imperial investiture on condition that they should surrender all their temporal property. This agreement was promptly rejected by those most interested on both sides and led to the final settlement in the Concordat of Worms (1122), whereby the dual nature of the clerical office as at once temporal and spiritual was recognized. The investiture with the spiritualities (ring and staff) was left to the papacy, while that with the temporalities (sceptre) was held by the Emperor. Similar but less violent conflicts in France and England led to a similar result.

A new phase of the conflict between church and state begins with the accession of the emperors of the house of Hohenstaufen. The Hohenstaufen (Ghibelline) policy was to extend the German Kingdom, under the disguise of the Empire, over Italy. In this ambition it was checked at every turn by the rising power of the Italian city republics. Frederick Barbarossa (1152-90) sought to incorporate these communities into his administration by placing governors (*podestà*) over them and utilizing their growing wealth for his larger plans. Led by Milan, the Lombard communes steadily resisted. Milan, destroyed in 1162, was rebuilt by her neighbors, and at the head of the great Lombard League gave the Emperor such a de-

eat at Legnano (1176) that in the Peace of Constance (1183) he conceded practically all the claims of the cities to independence. Throughout this fight the communes were steadily supported by the papacy. Their party the Guelph) was also the papal party; and though outside the cities there were many territorial nobles and inside there was always a noble faction that looked towards the Emperor, the great masses of the rising industrial population, organized in their craft and merchant guilds, were sturdily Guelph and in every crisis expected the support of the Pope. Henry VI, son of Frederick I (1190-97), had elaborate plans for refeudalizing Italy and sinking the communes in greater territorial units. Through his marriage with the heiress of the Norman Kingdom in the south and the birth of a son in 1194, he seemed to see the realization of the Hohenstaufen policy. His death, the consequent confusion in Germany, and the accession of the great Pope Innocent III (1198-1216) saved Italy for the time and gave to the papal power one of its greatest moments of triumph.

Innocent III realized more completely than any pope before or after him the Hildebrandine ideal. He was able to bring King John of England to surrender the overlordship of the land to him for his support against his nobles. He compelled Philip Augustus of France to take back his rejected wife. In the struggle for the German crown he championed Otho the Guelph against Philip of Hohenstaufen (1198-1208), but when Otho as King (1208-14) proved that no emperor could be a Guelph, as no pope could be a Ghibelline, Innocent turned against him at once. He gave his support to France against Germany and England in the battle of Bouvines (1214), by which his ward the young King Frederick of Sicily gained the Empire. At a Lateran council in 1215 Innocent displayed, as it had never been displayed before, the legal system on which the working of the papal idea depended.

The prestige of the papacy had been greatly increased by its leadership in the Crusades. The Crusade had been commended by Gregory VII. Events in the East had aroused attention so it soon afterward, and Urban II (1088-99) had made it the chief object of his administration. Throughout the long and not always creditable history of the Crusades (1096-1270) it was the papacy that gave to it whatever of unity and dignity it had. From Innocent III we may begin to note the gradual decline of the mediæval papacy. It had thriven upon the absence of strong national governments in Europe, and the rapid rise of the new nations closed up one by one the channels through which the papal power had made itself felt. The reign of Frederick II (1215-50) is one long conflict between the Imperial and papal schemes in Italy. On the whole, the Emperor was beaten, but the prestige of the papacy as a universal power was injured. The attempt of the Hohenstaufen to maintain a government in Italy was frustrated, but the papacy, by bringing the Angevin rulers from France into the South, sowed the seeds of new disaster. Rudolph of Hapsburg (1273-91) began a new policy for the Empire—to leave Italy out of the question in return for a free hand in Germany—and every deviation from this wise policy by his successors only showed again how completely the mediæval ideals of public life were passing

over into those of the modern world. The attempts of Henry VII (1308-13) and Louis the Bavarian (1314-47) to affect the balance of Italian politics proved utter failures.

On the other hand, the same thing is true of papal attempts to enforce discipline on the rulers of Europe. Boniface VIII (1294-1303) came to the papacy as the leader of the cardinalate in an unprecedented crisis. His predecessor, Celestine V, a pious recluse, had so completely fallen into the hands of the Neapolitan Angevins that he had raised to the cardinalate a number of French and Neapolitan prelates. He had then, largely under pressure from Boniface, resigned the papacy, and now the cardinals found themselves under the domination of such a will as had not been seen in the papal office since Innocent III. His violent attempts to break down the faction of the Colonna drove his enemies to the court of Philip IV of France, and there they found a fertile soil for their complaints. Philip, a completely modern ruler, needing all the money there was to spare in France, laid a tax upon the clergy. Boniface, in a series of able documents, laid down again the Hildebrandine doctrine of the freedom of the Church. Philip appealed to the national sentiment as expressed for the first time in the States-General and won his fight. Boniface, defeated and abused by the personal enemies he had made, died, the last great exponent of the mediæval papacy.

The wreck of the mediæval scheme of a papacy and an empire working in a harmony that was never attained threw the papacy upon a new alliance. The influence of France now replaces that of Germany. The result of the second conclave after the death of Boniface was the election of a Frenchman, Clement V (1305-14). The new Pope was met at Lyons by King Philip in person, and as a result of this interview he never left France. The cardinals summoned across the Alps obeyed, and thus began the French residence of the papacy, the "Babylonian Captivity" at Avignon (c.1305-77). This "exile" came about naturally through the working of the cardinal system. The French influence had secured certain cardinals from Celestine V; these decided the choice of Clement, and now he in turn was free to appoint enough more French cardinals to decide the character of the college for a generation to come. The close relation of the papacy to France withdrew from it the sympathies of the other nations, notably of England. It seemed in danger of losing entirely that Roman character which was its only source of authority. Pressure was continually brought to induce the popes to return to Rome; several attempts to do so were made, but were hindered by the French interests of the cardinals. Finally Pope Gregory XI did return and died at Rome (1378). The new election, held under fear of violence from the "Roman people," resulted in the choice of an Italian, Urban VI; but within a few months the French influence succeeded in raising sufficient doubts as to the validity of this election to justify the cardinals in choosing another Pope, Clement VII. Thus, still by the regular working of the papal machinery, the Church found itself, for the first time in its history, involved in a schism in which both claimants rested upon the same basis, a lawful election by cardinals.

Both parties appealed to the nations for support. In general, the Northern peoples sym-

pathized with the Roman Pope, France and Spain with the French one; but the really important result of the Great Schism (1378-1418) was the discussion it aroused as to the nature of the papacy and its relations to the Church at large. The feeling was constantly gaining force that the Church as a whole was misrepresented by a system which threw all the weight of the papal authority into the hands of a small body of persons at Rome. To change these persons to Frenchmen was no relief. What was demanded was a larger share to the nations in the Church constitution. These opinions gained in clearness as the difficulty of breaking the schism through the action of the cardinals became more apparent. The remedy was that most feared by the curial party at all times, a general council; but years passed before a way could be found for calling a council that would be respected. Finally, in 1409, the "union cardinals" on both sides united in this work, and the Council of Pisa supported them in making a new election. The Pope chosen, Alexander V, lived but a few months, and the same interests succeeded in putting forward John XXIII, who failed utterly to maintain the respect of the Church as against the two claimants set aside at Pisa, who now renewed their claims. See PISA, COUNCIL OF.

The Church thus found itself in a triple schism, honeycombed with the heresy of Wiclif and Huss and burdened with ecclesiastical abuses which every one saw, but which no one knew how to remedy without danger to the system itself. The Council of Constance (1414-18) met under these conditions. It first attacked heresy by examining and burning John Huss, who, relying upon the safe-conduct of the Emperor Sigismund, had voluntarily put himself into its power. It then proceeded to endless discussions of abuses and the means of relief, only at last to express a series of pious wishes and leave their execution to the Pope, whose election was accomplished by a joint commission of the cardinals and the council. Naturally the new Pope, Martin V, of the Roman family of the Colonna, failed to consider himself bound by the action of a council that could not agree within itself upon vital questions, and his "reforms" were of the most superficial kind. The papacy had come out of the trial of schism and opposition unchanged in its quality. It could not avert the assembling of the Council of Basel (1431-48), but it steadily opposed it. So long as the council could keep the respect of Europe it could maintain its existence, and at least succeeded in demonstrating its capacity to do things that the papal administration had failed to accomplish; but the longer it lasted the more apparent it became that Europe was not ready to exchange the traditional authority of Rome for the novel tyranny of an irresponsible council. Especially when the council proceeded of its own right to choose a pope, without reference to the Roman tradition, it became clear that such a pope could not be supported. What the Council of Basel really accomplished was to furnish to the nations a pretext for asserting their rights over their own local churches more firmly than ever, as, e.g., in the case of France, through the Pragmatic Sanction of Bourges (1438). When this was done the governments were comparatively indifferent to the general question of the papal constitution itself, and Nicholas V (1447-55)

stands at the beginning of a period more splendid than any other in the papal annals. The papacy now entered into the politics of Europe as one among the temporal powers (see PAPAL STATES), fell in with the prevailing enthusiasm for art and letters, and sought to direct the course of the Renaissance movement. In the meantime opposition was slowly and silently gathering in the North, which culminated in the Reformation movement and directly challenged the traditional supremacy of the papacy. The Protestant Reformation affirmed as the ground of its justification the financial tyranny, the spiritual indifference, and the antinational propaganda of the papacy. It formulated as its programme a return to what it claimed to be the early principles of a private interpretation of Scripture and a personal approach of every Christian to his God without other mediation than that of his personal faith. Against this demand the papacy set itself with all the resources of its past. Between the two ideas there was no compromise, and the result was secession. As late as 1541 it was hoped by many sanguine persons on both sides that some common ground might be discovered, but the Council of Trent (1545-63) reaffirmed in unmistakable terms the existing principles of the papacy as it had come to be. Recognizing the need of "reform" in many details, the council carefully avoided any action that might seem like compromise with rebellion. While not admitting in theory the fact of schism, the papacy henceforth was obliged to recognize it in practice and to devote all its energy to maintaining its hold upon what it had left and extending its sway over new lands. For later history, see ROMAN CATHOLIC CHURCH; PAPAL STATES. See also articles on the popes.

Curia Romana. The Roman Curia is the cabinet of the Pope, the departments of which aid him in the government of the Universal Church, and is made up of (a) the Roman Congregations and (b) the Offices and Tribunals of the Curia. There are ten Congregations and three Tribunals which are treated in more detail under ROMAN CATHOLIC CHURCH, *Curia Romana*.

John XXI	1276-77	Gregory XVI	1831-46
Nicholas III	1277-80	Pius IX	1846-78
Martin IV	1281-85	Leo XIII	1878-1903
Honorius IV	1285-87	Pius X	1903-14
Nicholas IV	1288-92	Benedict XV	1914

The following list of antipopes is given on the authority of Hergenröther (1824-90), who was Cardinal-Prefect of the Vatican Archives.

Hippolytus (?)	III century	Guibert or Clement III	1080-1100
Novatian	251	Theodorice	1100
Felix II	355-365	Aleric	1102
Ursinus	366-367	Maginulf	1105
Eulalius	418-419	Burdin or Gregory VIII	1118
Laurentius	498-501	Anacleus II	1130-38
Constantine II	767	Victor IV	1159-64
Philip	VIII century	Pascal III	1164-68
Anastasius	855	Calixtus III	1168-77
Leo VIII	956-963	Innocent III	1178-80
Boniface VII	974	Nicholas V	1328-30
John XVI	X century	Robert of Geneva or Clement VII	1378-94
Gregory	1012	Amadeus of Savoy or Felix V	1439-49
Sylvester III	1044		
Benedict X	1058		
Honorius II	1061-72		

The residence of the popes at Avignon began about 1305 with Clement V and ended with Gregory XI about 1377.

There was no residence of the popes at Pisa. A council was held there, but not a general council, and all its acts were condemned by Gregory XII. There were at the time (1409) three claimants for the pontifical throne; Alexander V, Gregory XII, and Benedict XIII.

PAPAGO, pā'pā-gō. An important tribe of Piman stock (q.v.), originally occupying a large portion of Arizona, south of the Gila, and extending across the border into northern Sonora, Mexico. They were missionized by the early Jesuits and Franciscans and are now practically all Catholic. They are agricultural, industrious, and peaceable towards the whites, but were compelled to wage constant war with the Apache until a recent period. They were recognized as citizens under the Mexican government, but their rights were disregarded on the annexation of the territory to the United States, and, by the seizure of the best lands and water supplies by the American settlers and land companies, the majority have been rendered homeless nomads. Hundreds of them earn good wages as railroad laborers. They number 3798 on San Xavier Reservation, Tucson, and the intervening territory to the south. The number in Sonora is unknown. Consult K. S. Lummholtz, *New Trails in Mexico* (New York, 1912).

PAPAIN. A digestive ferment derived from the juice of *Carica papaya*, a South American fruit tree belonging to the order Papayaceæ. This ferment is a mixture containing vegetable globulin, albumoses, and peptone. It digests all forms of proteid or albuminous matter, whether coagulated or not, and whether the medium in which it works is acid, alkaline, or neutral. It is a rapid solvent of false membrane. Papain is serviceable in gastroenteritis, gastritis, infantile diarrhœa, and fermentative dyspepsia. It is prepared in powder and tablet form, and a glycerole is also made. Papain is also known as papayotin and caricin and is not official.

PAPAL GUARANTEES, LAW OF. A law passed by the Italian Parliament at Florence in 1871, shortly before its transfer to Rome, which aimed at making the papacy and the Italian government mutually independent. It guaranteed to the Pope the diplomatic privileges of a sovereign power with its own ambassadors and its own court in the midst of Rome, separate postal and telegraphic communications with foreign countries, and an allowance of 3,225,000 francs a year. It allowed further to him and his successors the use of the Vatican and Lateran palaces and certain other buildings and precluded all government officials from entering any of these buildings without permission. It relinquished the royal exequatur and placet, or the necessity of the King's assent to the publication and execution of acts of the ecclesiastical authority; it exempted the bishops from any oath of allegiance to the crown and gave the clergy complete freedom of meeting. It put an end to appeals to the civil courts against acts of spiritual discipline, but, on the other hand, it denied to the Church courts the aid of the civil tribunals in enforcing their decisions and made the discussion of religious subjects completely free. This plan, of which a draft had been found among the papers of Cavour and which attempted to realize his ideal of "a free church in a free state," was opposed by the Liberals as leaving the Pope in far too independent a position. It was submitted to the Powers with the view of obtaining international sanction, but this failed through the refusal of England. Partly, perhaps, owing to French influence, the Pope decided to refuse these offers, to ignore the Italian government completely while remaining in Rome, and to seclude himself as a voluntary prisoner in

the Vatican. Consult J. W. Probyn, *Italy from 1815 to 1890* (London, 1891), and G. Gustine, *La loi des garanties* (Paris, 1901).

PAPAL STATES, or STATES OF THE CHURCH. The name applied to the territory in central Italy, varying in extent, which from the Middle Ages until the last half of the nineteenth century was under the temporal sovereignty of the Pope. The earliest origin of this dominion is difficult to assign to a definite year. Although the so-called Donation of Constantine is now known to have been a later invention, there is no doubt that he made many rich gifts to the Church, especially after his victory over Maxentius; the Lateran Palace, for 1000 years the residence of the popes, seems to have been given to them during his reign. Like other bishops, the bishops of Rome acquired by degrees not unimportant political rights, and when the seat of the Empire was removed to Byzantium it was partly their rich possessions that gave them their great influence in the affairs of Italy. By the time of Gregory the Great (590-604) the Roman see possessed at least 23 estates with a total area of some 1800 square miles in various parts of Italy and the adjacent islands, in southern France, and even in northern Africa. The beginning of full sovereignty in the modern sense may, however, be said to have come from the presentation of the town of Sutri by the Lombards to the Apostles Peter and Paul in the person of Gregory II (727). The Lombards were uncertain friends, however, and the popes were obliged to appeal to the Frankish Kingdom for aid against them. In 754 Pepin transferred considerable and definite territories to Pope Gregory III, and in the following year, brushing aside by conquest any claims which either the Lombards or the Byzantine Emperor made to these lands, placed the Pope in undisputed possession of them. (See DONATION OF PEPIN.) Charlemagne increased them, until they extended from Luna, near the present Lucca, to Capua, including the Duchy of Rome, the Pentapolis, Æmilia, and the Exarchate of Ravenna, or nearly the whole of central Italy.

This sovereignty, though attacked during the troubles of the tenth century by the Italian factions, increased gradually during the eleventh and twelfth. In 1014 the Emperor Henry II resigned half of Tuscany into the Pope's hands; Leo IX received the overlordship of Benevento from Henry III in 1052, and the principality came into the full possession of the holy see in 1077, on the extinction of the family which had ruled it. In 1115 the Countess Matilda of Tuscany left the Pope her fiefs of Parma, Modena, Reggio, and Garfagnana, and part of Mantua. They were, however, seized by the Emperor, and only part of southern Tuscany actually came into the Pope's hands. In these times, in any case, the power of the Pope was little more than a feudal suzerainty over a number of petty princes or over cities with their own government, who paid tribute to the popes and were bound to assist them with a military force in case of need. In France Gregory X gained the Comtat Venaissin from Philip III in 1274, and Clement VI bought the town of Avignon in 1348. During the Avignon period, however (c.1305-77), the temporal sovereignty of the popes over their Italian territories was menaced or weakened by the ambition of the great families, and Cola di Rienzi

even succeeded for a time in shaking it off from Rome itself. In the sixteenth century the popes entered so largely into the political movements of Europe, and were of such importance to the maintenance of the balance of power, that prudent statesmanship was able to increase their territory largely. Sixtus IV at the end of the fifteenth century established his jurisdiction over Romagna; additions were made of Bologna in 1512, Ancona in 1532, Camerino in 1545, Ferrara and Comacchio (the possessions of the house of Este) in 1598, Urbino in 1631, Castro and Ronciglione (the last additions) in 1649.

Great changes began with the end of the eighteenth century. In 1768 the Bourbon rulers of Naples seized Benevento and Pontecorvo, and in 1783 dissolved altogether the connection with the Roman see which had existed for more than seven centuries. Avignon and Venaissin were occupied from 1768 to 1774, as they had been twice in the preceding century, by the French Bourbons, and in 1791 passed under the jurisdiction of the French Republic. By the Treaty of Tolentino (1797) Pius VI was obliged to resign the three legations of Bologna, Ferrara, and Romagna into Napoleon's hands, and a year later the remaining territory was seized and erected into the Roman Republic. This was overthrown by the Second Coalition in June, 1799; on July 3, 1800, Pius VII entered Rome, which had been held by the Neapolitans, and reestablished the old constitution in his States, now deprived of Romagna, Bologna, and Ferrara. The French again took possession of them and in 1809 incorporated them with the Empire, Rome being reckoned as its second city. The Congress of Vienna in 1814 restored the States of the Church, now embracing the marches of Ancona and Camerino, the duchies of Benevento and Pontecorvo, and the legations, except a part of Ferrara, which Austria retained. In 1831 and 1848 there were risings against the government. The former was suppressed by the aid of an Austrian army; the latter assumed such proportions, even in Rome itself, that Pope Pius IX was forced to flee to Gaeta, while Rome was proclaimed a republic. He was restored by the arms of France in 1849. The Austrians held the legations for the Pope until 1859, and the French occupied Rome in his behalf (except for a part of 1867) until 1870. In July, 1859, on the withdrawal of the Austrian troops, the Romagna threw off the papal authority and declared its annexation to the Kingdom of Sardinia, or, as it was to become a few months later, of Italy. After the defeat of Lamoricière, the papal general (1859), Umbria, Urbino, and the Marches were annexed by Victor Emmanuel; and the isolated possessions of Benevento and Pontecorvo shared the same fate. In October, 1870, the French army having been withdrawn in July, the remnant of the Papal States voted for union with the Kingdom of Italy. It was the original intention of Victor Emmanuel's government to leave the part of Rome known as the Leonine city under the Pope's control as a compromise; but it was rejected equally by the Pope and by the inhabitants, and the Pope's jurisdiction was restricted within the limits of the Vatican, outside of which, as a protest against the legality of the Italian occupation, he has never set foot since 1870. Roman Catholics generally, while of course not considering the temporal power as in any way essential, yet regard it

as very expedient for the proper exercise by the Pope of his high functions that he should be independent and not the subject of any temporal ruler. This is maintained not only on theoretical grounds, but as demonstrated historically by the events of the Avignon captivity and by more than one incident of the period since 1870. See ITALY; PAPACY; PAPAL GUARANTEES, LAW OF.

PAPAV'ERA'CEÆ (Neo-Lat. nom. pl., from Lat. *papaver*, poppy). THE POPPY FAMILY. A family of dicotyledonous plants, mostly herbs or somewhat shrubby and usually with milky or colored juice. The family is characterized by its alternate leaves, regular flowers, caducous sepals (usually two), four to six petals, numerous stamens, and a single ovary which becomes a capsule containing numerous seeds. In some cases the capsule opens by small pores just under the expansion formed by the stigmas. In this way the seeds are well protected and escape only when shaken by the wind or other agencies. The family is distinguished for narcotic properties. Opium (q.v.) is its most important product. The juice of celandine (q.v.) is very acrid. A number of species are used in their native countries for medicinal purposes. The seeds yield fixed oil, which, with the exception of that obtained from *Argemone mexicana*, is bland. The flowers of many species are large and showy, most frequently white or yellow, sometimes red. Several kinds of poppy and of *Eschscholtzia* are frequent in gardens. There are about 23 genera and 115 species, widely distributed but most abundant in the north temperate zone. The chief representatives of the family in North America are bloodroot (*Sanguinaria*), celandine poppy (*Styliphorum*), several introduced species of poppy (*Papaver*), and prickly poppy (*Argemone*). See POPPY.

PAPAVERINE, pā-pāv'ēr-in. See ALKALOIDS.

PAPAW' (from Sp., Portug. *papaya*, from Malabar *papamaram*, the native name given to the tropical fruit that is also called papaya). The papaya, or tropical papaw (*Carica papaya*), is a common tropical plant largely cultivated for its edible fruits. The green fruits, as well as the whole plant, abound in a milky sap that contains the ferment papain (q.v.). The plant is of rapid growth, attaining a height of 12 to 15 feet, and bears fruit in 12 to 14 months from planting. The trunks seldom branch, and the fruits are borne from the axils of the large, long-petioled leaves. The plants are commonly propagated from seed, but they may be grafted and rooted under certain conditions. Monoecious, dioecious, and hermaphrodite plants occur, and experiments have shown that the character of flowering and the quality of the fruit may be greatly influenced by selective breeding. The fruits, which somewhat resemble a small cantaloupe, are a favorite breakfast fruit throughout the tropics generally. The name "papaw" is

also given to several species of *Asimina*, a genus of the family Anonaceæ, occurring in the eastern

United States. The common papaw, *A. triloba*, is a small tree or shrub. See CUSTARD APPLE.

PAPAYOTIN. See PAPAIN.

PAPE, pāp, ERIC (1870-). An American landscape, genre, and historical painter and an illustrator. He was born in San Francisco and studied under Carlson in New York, and in Paris chiefly at the Ecole des Beaux-Arts under Gérôme and Laurens. After travels in France, Germany, and Egypt he formed an individual style distinguished by an almost barbaric splendor of conception, opulent fancy, and boldness of line. He first gained recognition through his genre and philosophic paintings, then became known as an illustrator and landscape painter. In 1898 he founded the Eric Pape Art School at Boston, which he directed until 1913. Characteristic paintings by him are "The Sphinx by Moonlight," "The Two Great Eras," "Nahib-icha," "Cerise and Gray," and the "Flute Player"; but perhaps his happiest inspirations are his 300 illustrations for Lew Wallace's *Fair God*. A very different appeal is made by his landscapes, which are simple, direct, and sincere, with something of the cosmic quality of Millet. They include "Early Morning, Annisquam," "A Breezy Morning," and "The Dying Day." Pape received medals and diplomas at various exhibitions.

PAPE, pā'pe, WILLIAM (1859-). A German historical and portrait painter. He was born at Karlshütte, near Rendsburg, studied at the Berlin Academy and in Paris, and learned fresco painting under Prell. He is known chiefly as a court painter, whose subjects are drawn from contemporary German history. Two of them, "One Empire, One People, One God" and "The Confirmation of the Crown Prince and Prince Eitel Friedrich," are in possession of the German Emperor. He deco-

rated a room in the new courthouse at Bielefeld and painted "Luther's Last Confession," in the Luther house at Eisleben. Among his portraits are those of the German Emperor and Empress, Prince von Bülow, Admiral von Tirpitz, and Count Ballestrem.

PAPĒETI, pápá'tē. The capital of the French possessions in the eastern Pacific. See TAHITI.

PAPER (OF., Fr. *papier*, from Lat. *papyrus*, from Gk. *πάπυρος*, *papyros*, *papyrus*). Although the word "paper" is derived from "papyrus" (q.v.), papyrus is not a paper at all, and the beginnings of the paper industry are not traced back to it, but to the genuine paper made by the Chinese from very early times. From the Chinese it spread to other races and was probably brought into Europe during the twelfth century through the Moors into Spain and at the time of the Second Crusade into Italy. About the year 1150 a paper mill was started at Fabriano, Italy, which became the principal centre for paper making, and this region continues the manufacture to the present day. From Italy the art spread to France and Germany, somewhat later to England, where it was not well established until the Revocation of the Edict of Nantes in 1685 sent many French paper makers into exile to England and America. In 1690 the first paper mill in America was built by William Rittenhouse at Roxborough, near Philadelphia. The first paper mill in New England was built by a company to which was granted by the Governor and Legislature in 1728 the sole privilege of making paper in the Province of Massachusetts for 10 years. In 1730 the manufacture of paper was begun by this company, and specimens of paper were shown to the Legislature.

Up to the beginning of the nineteenth century, while machinery was used to reduce the rags to a pulp, the formation of the sheet of paper was done entirely by hand, sheet by sheet, as described below. About 1798 Louis Robert, a workman in the mill of Didot at Essonne, France, patented an invention for making paper in an endless web, but it was not put to practical use till developed in England by Henry and Sealy Fourdrinier, who spent and lost a fortune perfecting the machine. They are properly considered the founders of modern paper making, and their machine is universally known as the Fourdrinier machine. So well was their development work done that the early machines differ in minor details only from the most modern machine running to-day.

Earliest Process of Manufacture. The method of manufacturing paper by hand from the inner bark of the paper mulberry, as practiced to-day by the Japanese, probably represents the method in vogue from the very earliest times. It is of interest not only on account of its antiquity, but because it presents in outline all other methods, which merely are adaptations of the processes here described. A sheet of paper is an artificially felted web of vegetable fibre, purified of perishable materials, so that the remaining fibres are more or less pure cellulose (q.v.). The process may be described as collecting the raw material, cleaning it by boiling with lye, macerating it to a fine pulp, diluting with water, forming a sheet on a porous surface (that the water may drain off), and drying the sheet of paper thus formed. The Japanese strip the paper mulberry of its bark, soak it in water till soft enough to strip the

PAPAW AND PERSIMMON

PERSIMMON (*Diospyros Virginiana*).

PAPAW OR MELON TREE (*Carica Papaya*).

outer bark, then separate the inner bark, dry in the sun, and boil with lye obtained by leaching wood ashes. After being well washed, the bark is now beaten into pulp by four men seated around a board of hard wood on which the bark is placed. The men pound with long wooden mallets and turn out each day about 80 pounds of pulp per man. The fibre is now mixed with sufficient water, and the sheet of paper formed on a sieve made of fine strips of bamboo. A wooden frame is fitted on the sieve to hold the right amount of liquid pulp. This elevated border is called in Europe the deckle and prevents the pulp from spreading beyond the limits of the sheet. After dipping the sieve into the vat of pulp, the paper maker dexterously shakes the mold in all directions as the water drains off, thus felting the fibres in all directions and making a strong sheet. The sheets are then spread out on a board and dried in the sun.

The European method of making paper by hand differs in several respects from the Japanese. The raw material used (originally linen rags) is too tenacious to be reduced to pulp by hand power, and the earliest European mills used a sort of trip hammer or pestle driven by a water wheel. This in turn was superseded by the modern beating engine or Hollander, invented by the Dutch in the latter part of the seventeenth century, as described below. The sieve used, instead of being made of bamboo, is of wire cloth, with a movable edge or deckle. The workman after forming the sheet removes the deckle, turning the damp sheet onto a sheet of woolen felt. A pile of these sheets, alternate paper and felt, is called a post, and is placed in a press to remove the water. The sheets are afterward hung up in a loft to dry and finished by sizing with glue or gelatin and smoothed by pressure or calender rolls. Hand-made paper always has four rough edges, while machine-made paper has only two. These are usually trimmed off unless an imitation of hand-made paper is wanted. The rough-edged paper is called deckle edge. Paper making is primarily an art and is dependent upon the skill of the individual paper maker. Hence there is no standard in paper.

Raw Materials. The preparation of any raw material for use as paper stock consists essentially in isolating the cellulose in the form of fibres of as great length as possible. As cellulose is the structural base of all plants, theoretically any plant might furnish the paper maker with material for his mill. It becomes therefore a question of cost of producing the pure cellulose, and quality of the product. The earliest plant used was the paper mulberry, whose fibres are very easily separated, and a fairly pure cellulose obtained by simply boiling with lye. As this plant does not grow in Europe, it is not used in modern paper making. The chief material used up to the middle of the nineteenth century was cotton and linen rags. These are already reduced to nearly pure cellulose by the processes of textile manufacture, and cleaning and boiling with an alkali is all that is needed to prepare the stock for pulp. Wood is the raw material of most importance to the paper maker to-day, and esparto grass (alfa) is used in England on a large scale. Straw, waste paper, old rope, jute butts, hemp, etc., are also used. The different processes of reducing the material to a suitable fibre will be considered later.

Process of Manufacture by Machinery.

Whether for hand-made or for machine-made paper, the preparation of rags for pulp may be divided as follows: (1) cleaning; (2) boiling; (3) washing; (4) bleaching; (5) beating or reducing to pulp. The preparation of substitutes for rags is practically the same, except that the boiling process is more drastic, varying with the substance used.

1. *Cleaning.*—Rags are received at the mill in bales more or less sorted into white, colored, linen, cotton, canvas, etc., but need, for the finer sorts of paper (in which alone rags are now used at all), a thorough dusting and further sorting by hand. The duster may be of various forms and removes dust and foreign substances by vigorous mechanical methods. The sorting is done by girls who stand before tables covered with wire screens through which dust and dirt sifts. The girls cut off buttons, rubber (a great curse to the modern paper maker, as it does not bleach and appears in the paper as black specks, besides sticking to rolls and clogging the straining screens), and other foreign substances, and sort the rags accurately into different grades. A further dusting and chopping into pieces a couple of inches long make the rags ready for boiling.

2. *Boiling.*—The rags are packed in a large horizontal boiler, called the rotary. This is provided with manholes for the admission and discharge of the rags and lime and is mounted on hollow trunnions through which steam is admitted. To clean the rags from all fatty, colored, and noncellulose impurities, a solution of lime is used and the rags cooked and slowly rotated under steam pressure for several hours, the amount of lime, pressure, and time of boiling varying according to circumstances. When sufficiently cooked the steam and liquor are blown off and the rags dumped out by slowly revolving the rotary with the manholes opened. The rags are now of a brown color, and most of the impurities have been saponified, combining with the lime to form insoluble compounds which can be washed away, or, in the case of colors, reduced to simple colorless compounds.

3. *Washing.*—The washing or beating engine is shown in the cut. It is also called the Hollander. It consists of a wooden or metal tub, 10 to 15 feet long, with rounded ends, in the

FIG. 1. PULP-BEATING ENGINE.

centre of which is a partition *E*, called the mid-feather; a roll *C* is provided with knives and revolves rapidly over a bed plate *B* of similar knives. The distance between the bed plate and

the roll is regulated by raising or lowering the supports of the roll with a wheel and screw. The rags after passing between the bed plate and the roll flow down the backfall *A* and around the mid-feather back to the starting point, as indicated by arrows. The washing engine is provided with a washing cylinder *D*, which is so made that as it revolves it scoops up the water, which flows out through its axis, the rags being kept out by a fine wire cloth surrounding the cylinder. The rags to be washed are put into the washing engine with enough water, the roll being raised so that the rags pass around freely without being beaten into pulp, as otherwise the dirt would be ground into the fibre. A large quantity of water is admitted, which is removed by the drum washer, as described above, and the rags are in this manner rapidly cleaned. The roll is now lowered gradually, and the rags slowly macerated, losing their characteristics of textiles, and being finally

the weight. As paper is usually sold by the pound, the latter consideration is not without its influence, the loading sometimes amounting to 33½ per cent. An addition of 10 per cent of mineral is not considered an adulteration. Bleached pulp has a yellowish cast, and to obtain a pure white a little blue is added, and papers that are colored in the pulp are prepared at this point. Sizing is added to prevent the absorption of ink. Unsized (or water-leaf) papers absorb water readily and cannot be used for writing with a pen. The sizing is of two kinds, vegetable (rosin) size, added at this stage of manufacture, and animal (glue) size, which is applied externally after the paper is made. The accompanying plate shows the beating engines in a "news" mill at Rumford Falls, Me. A boy is furnishing the second engine, putting in chemical fibre, while the ground wood is run in from the large pipe above. On the other side is seen a man getting out china clay from a cask.

FIG. 2. FOURDRINIER MACHINE IN SECTION.

resolved into single fibres of varying lengths. When the washing is completed the washing cylinder is raised out of the beater and the supply of water cut off. The beating process is then continued a little longer till the pulp reaches the stage called half stuff, the practice varying in different mills.

4. *Bleaching*.—The pulp is now as white as it can be made without bleaching and is a light gray if medium-grade white and colored rags were used. The addition of a solution of chloride of lime (bleaching powder), decomposed by sulphuric acid, bleaches the pulp to a creamy whiteness. In America the bleaching is done in the washing engines, but in Europe a separate tub is often used. In place of chloride of lime a solution much used in France is prepared by electrolysis of magnesium chloride. After bleaching, the pulp is emptied into the drainers, large chambers with floors of porous tiles, where the moisture and surplus bleach drain off. The pulp is left some days in the drainers, till it is nearly dry. In Europe, in place of drainers, the pulp is usually dried by making up into thick sheets of paper on a machine similar to the wire of the Fourdrinier machine, called a *presspâte*.

5. *Beating*.—The half stuff is next put into the beating engines, which are similar to the washers but have no washing drum, and the knives are arranged to macerate the pulp faster. At this point the loading materials, color, and sizing are added, and if various fibres are used, such as rag, wood fibre, or esparto, they are mixed here, while the half stuff is being reduced to the very fine condition required for making into paper. Most papers contain a filler, usually china clay (kaolin, q.v.) or sulphate of lime (pearl hardening). This fills the pores, giving a more even printing surface, besides adding to

Rosin size is prepared as follows: A rosin soap is made by dissolving rosin with caustic soda or potash; this is added to the pulp in the beating engine and precipitated on the fibres by the addition of a solution of alum or sulphate of alumina. Paper thus sized is called engine-sized or rosin-sized paper, as distinguished from tub-sized or animal-sized, which will be described later.

The pulp may be beaten fine enough in the beating engine, but the American practice is to dump it into a stuff chest, a large circular receptacle, with a horizontal agitator to keep it from settling, and then to pump it through a so-called Jordan or refining engine into a second stuff chest, whence it is pumped to the Fourdrinier machine.

As indicated above, paper making is primarily an art. It is at the beating engine that the paper is really made. The final mixture upon leaving the beater may be called the real paper, for it is at that point that all its ingredients are brought together to grade the paper.

Jordan Engine. This is a most successful American invention, in universal use in the paper mills of America, but practically unknown in Europe, in spite of its large saving of time, space, and power. It was invented in 1862 by Joseph Jordan, of Paterson, N. J., who never benefited financially from the invention and was supported in poverty by the paper makers of America until his death. The Jordan consists of a stationary hollow cone mounted with knives on the inside which fits over a solid rapidly revolving cone mounted with similar knives on the outside. The pulp passes between these cones, and the knives can be brought close together or separated with great accuracy, so

that the degree of fineness of the pulp can be adjusted.

Fourdrinier Machine. This consists of the following parts: *A*, the screens; *B*, the wire, with dandy roll, deckle straps, and suction boxes; *C*, the couch rolls; *D*, the first press; *E*, the second press; *F*, the driers; *G*, the calenders; *H*, the reel; and *I*, the slitter.

A. The Screens.—From the second stuff chest the pulp, which is now diluted with a large amount of water, flows through sand settlers and regulating gates to the screens. These consist of brass plates with a large number of longitudinal V-shaped slits cut in them, the opening being very small, only a few thousandths of an inch. A continuous jarring is given to these plates, which forces the fine pulp through the slits, but the lumps and impurities are retained. In some forms of screen a vacuum pump is used combined with an oscillating motion of the screens, which keeps the pulp flow-

are impressed in the paper by affixing the required design on the dandy roll. A false watermark is sometimes made after the paper is partly dried by passing between rolls engraved with a design.

C. Couch Rolls.—At the end of the wire (i.e., where it turns down over a roll to return to the starting point) are the couch rolls, covered with felt, through which the wire passes bearing the web of paper. These rolls press the water out still more and consolidate the fibre, giving it strength to cross alone the gap between the wire and the felt of the first press roll. These rolls correspond in function to the pressure applied to the post of alternate sheets of damp paper and felts in hand-made paper.

D and E. The Press Rolls.—An endless woolen blanket (the felt) supports the tender web of paper through a pair of highly polished brass rolls under considerable pressure, giving the upper side of the sheet a smooth surface and

FIG. 2. FOURDRINIER MACHINE IN SECTION.

ing back and forth, preventing the clogging of the slits.

B. The Wire.—The strained and purified pulp flows over an apron onto an endless traveling wire cloth, the mesh of which is 60 to 90 threads to an inch. The wire is supported perfectly level on a great many small rollers (the table rolls), under which is a shallow wooden box, the save-all, into which much of the water runs, leaving the pulp on the wire. The water in the save-all contains much pulp and is used over again. The boundary of the flow of pulp on the sides is made by endless rubber bands, called deckle straps, which travel with the wire. These are adjustable so that varying widths of paper may be made. The frame supporting the wire receives a lateral motion, which greatly assists in the felting of the fibres into a strong sheet. The forward motion of the wire tends to arrange the fibres in the same direction, and the side shake is necessary to offset this tendency, giving strength in both directions. Notwithstanding, it is easy to tell by tearing which way a sheet of paper was made on the machine. The water drains rapidly away from the pulp, assisted by two or three suction boxes under the wire, which are connected with an air pump and exhaust the water much faster than would otherwise be possible. At this point, between the first and second suction boxes, is situated the dandy roll, a light cylinder covered with wire, which rests on the upper surface of the moist paper, giving it the impression of whatever design is on it. Wove paper has both sides impressed with the fine woven wire, i.e., the dandy roll is covered with the same wire as the paper is formed on. In laid paper, on the other hand, the dandy is covered with parallel wires, with a cross wire at intervals. Watermarks

leaving the impress of the felt on the underside. From the first press *D* the sheet runs under the second pair of rolls *E* and back through them in the reverse direction, thus smoothing the other side of the sheet and giving as even-sided results as possible.

F. The Driers.—The paper is now formed, and it only remains to dry it. The driers are a series of steam-heated metal cylinders, 2 to 4 feet in diameter, arranged in one, two, or three tiers. The paper is carried nearly round each in turn and on to the next, being held to the hot surfaces by an endless blanket, usually of cotton. Sometimes there are smoothing rolls when the paper is partly dried. The size and number of driers determine how fast a paper can be run. With a given machine thin papers can be run (and dried) very fast, thick ones slowly.

G. The Calenders.—After being thoroughly dried the web of paper is passed through a stack of smooth chilled iron rolls, which by their own weight and pressure applied by screws or weights smooths the paper and produces what is called machine-finished paper, as contrasted with supercalendered paper, described farther on. It is now wound on a reel.

H and I. The Reel and Slitter.—After being wound on a reel the paper is passed through the slitter, the rough outside edges trimmed, and if necessary the single web slit into any required widths. It is then rewound and is ready for shipment, if intended for printing in the roll or for coating; or for supercalendering, sheeting, and packing.

The Fourdrinier machine makes automatically an endless web of paper from 60 to 180 inches wide at a speed of 10 to 700 feet per minute. The plate shows the reels, calenders, and driers

of one of the largest machines in the world. This machine can make paper 180 inches wide. It can run at a speed of 650 feet per minute, and produce 76,000 pounds of paper in 24 hours.

Supercalenders. Much book paper requires a high finish, i.e., a very smooth surface, and this is given by passing it between alternate iron and compressed-paper rolls under great pressure. These machines are called the supercalenders. It is then sheeted, counted into reams of 480 or 500 sheets, and packed in cases or bundles.

Animal Sizing and Loft Drying. The finer grades of writing papers are not finished as here described, but when partly dried are passed through a vat of gelatin (glue) in solution, the excess being squeezed off by rollers, and either slowly dried by passing over a large number of hollow drums with fans inside or cut in sheets and hung in lofts to dry in the manner employed for hand-made paper.

The following are the main differences in the preparation of rag substitutes from the process given above.

Esparto grass comes from Spain and Africa and is very largely used in England. The grass is cleaned, dusted, and boiled with caustic soda under pressure, a so-called vomiting boiler being usually used; it is then washed and bleached in much the same manner as rags. It gives a white fibre of fair strength.

Straw is used largely in the United States, chiefly for strawboard, and not reduced to a pure fibre. Its characteristics are similar to esparto, but it is more difficult to reduce to pure cellulose, owing to the silica it contains, requiring a stronger alkali and higher pressure in boiling.

Wood Pulp. There are two kinds of wood pulp used in paper making, mechanical pulp, or ground wood, and chemical fibre. Of the latter there are three processes of manufacture, the soda process, the sulphite, and the sulphate.

Ground Wood is made by pressing blocks of wood obliquely (across the grain) against rapidly revolving grindstones, a stream of water carrying off the product, which is not chemically changed and has very little fibre or strength. It is used very largely, however, for cheap newspaper, chiefly in connection with chemical fibre, to impart greater strength. The plate (Fig. 1) shows a pulp grinder at Rumford Falls, Me., the stone being coupled directly to a turbine water wheel. It will be seen that there are three pockets, in which blocks of wood are placed and pressed simultaneously against the stone. The pulp is then screened to remove lumps, bleached if necessary, and either run directly into the beaters if made into paper at the same mill (as at Rumford Falls; see Plate, Fig. 2), or made into thick sheets by a machine similar to the cylinder paper machine described below. It is usually sold in a moist state. Paper containing ground wood turns yellow when exposed to the light and becomes brittle. A solution of sulphate of aniline turns ground-wood fibre a bright yellow, the intensity of the color giving a rough guide to the percentage of ground wood in the paper.

The origin of the ground-wood process has been the source of much discussion. The most authentic works give credit to Herman Keller, who while walking in the woods was attracted by a bees' nest. Analysis of the material from which the nest was made led him to believe that

it was paper made from mechanically isolated wood fibres. His later experimental work proved his theory to be correct.

Chemical Wood Pulp. The oldest process of freeing cellulose from the incrusting woody matter, producing a material for making white paper, is the soda process, patented by Watt and Burgess in England in 1854. A soft wood—usually poplar in America, pine in Europe—is barked, chipped across the grain into small pieces, and cooked under steam pressure with a solution of caustic soda. The alkali dissolves everything but the cellulose, and after washing and bleaching a soft white fibre of good quality is produced, of little strength, but very useful to supplement other fibres.

The *sulphite process* is apparently an American invention, the first patent being granted in 1867 to B. C. Tilghmann. He used sulphurous acid to produce pure cellulose, and while this is the base of the modern process, it was not brought to a practical success till bisulphite of magnesium or calcium was used instead. Mitschelich in Germany brought the process to a commercial basis, and of late years it has developed to very large proportions. Various modifications of the process are used, but in all of them the wood, properly barked, chipped, and dusted, is digested under steam pressure in a solution of the bisulphite, washed, and bleached if necessary. Sulphite fibre has good strength and color, and much of it is used unbleached.

The *sulphate process* is much used in Sweden for making a very strong pulp, widely used in making tough board and wrapping papers. It is similar to the soda process in theory, but sulphate of soda is used. It was objectionable to American manufacturers because of the offensive odor arising from its by-products and hence has not become widely used in American mills. The pulp became very popular with paper manufacturers about 1905, when it was introduced as a valuable substitute for manila stock, which was too high in price to be practicable for the average wrapping paper. Large quantities are now imported by American manufacturers annually. A great advantage with this process is that much of the saw-mill waste can be utilized and the fibres of many kinds of wood can be isolated to better advantage than in any other chemical process.

In the different processes of treating wood various forms of boilers are used—stationary, rotary, cylindrical, and spherical. They have to be lined to resist the action of the chemicals, and lead or cement is commonly used for this purpose. A large factor in the successful conduct of pulp manufacture lies in recovering the chemicals from the spent liquor. In the soda process the liquor is evaporated and finally incinerated in a furnace from which nearly all the caustic soda used is recovered. There are similar economies practiced in the other processes, which not only save valuable chemicals but prevent the pollution of streams.

New Sources of Pulp. The rapid destruction of the forest lands of America and Canada for the purpose of paper making has caused a scientific movement for the conservation of the wood supplies. This action has brought about a study of new paper-making supplies. Experiments have resulted in the practical utilization of many kinds of wood besides spruce, poplar, and hemlock. Saw-mill waste has been widely

PAPER-MAKING MACHINERY

2. BEATING ENGINES IN RUMFORD FALLS MILL

PAPER-MAKING MACHINERY

PAPER MACHINE AT MILL OF INTERNATIONAL PAPER CO., RUMFORD FALLS, MAINE

used. Cornstalks have been found to be practical as a paper stock, and a mill in Georgia is now turning out paper with this stock.

The Cylinder Machine. While almost all paper, ordinarily so called, is made on the Fourdrinier machine, a very large class of heavy papers, cardboards, strawboard, news board, binders' board, and the like, as well as most tissue paper, is made on a different machine. Instead of the horizontal wire on which the pulp flows, the wire is fastened around a cylinder which dips in a vat of pulp, and as it revolves a film of pulp comes up with it, the water running off through the wire. As there is no lateral shake, the paper is not felted as well as on the other machine and has less strength across the web. It is easy to arrange several vats and cylinders so that the sheets shall unite, and in this way very heavy boards are made. The rest of the machine, press rolls, driers, etc., is the same as described previously. While, as already stated, the product of the cylinder machines is not so important, there are in the United States nearly as many of these in operation as Fourdrinier machines.

Coated Papers. A large amount of paper is given a surface coating of various substances after it leaves the paper mill proper. The process of coating is as follows: The paper is fed in a continuous roll to a rotary brush which applies the coating on one side. Other brushes spread the material evenly, and it is then hung from sticks in festoons in a steam-heated room. The sticks rest on moving racks which pass the festoons slowly down the room. When dry the paper is rewound and calendered, glazed, or embossed. If it is to be coated on two sides, it is passed through the machine a second time and the other side coated. A patented process for coating both sides at once is in use, but is only suitable for a cheap product.

Coated book paper (used for illustrations of the better sort where a very smooth surface is needed to reproduce every line and shading of the picture) is coated with clays and glue or casein, and the necessary smoothness obtained by calendering in a machine similar to the super-calender described above, but having compressed cotton rolls in place of paper ones. Lithographic paper is usually coated on one side only and is used for printing from stones. See LITHOGRAPHY.

Glazed papers are chiefly used for covering paper boxes. They are coated on one side only and given a very high glossy surface by the *friction calender*. This consists of a top roll of polished iron heated by steam revolving at a much higher speed than the roll below, which is made of compressed cotton. The paper as it passes between these rolls is smoothed as if a hot iron were passed over it. Colors are given to the coating, various pigments being mixed with the clay; and the high lustre is obtained by using beeswax or carnauba wax in the coating mixture. Many other fancy effects are obtained by coating and embossing paper.

Wall paper is printed in various colors and designs from paper in the roll and is often embossed. See WALL PAPER.

Manila Paper. Originally the wrapping paper called manila paper was made of manila hemp, jute, old rope, and other substances having a strong fibre. Since the introduction of sulphite fibre the ordinary manila wrapping paper of commerce is made wholly of wood,

while the strong paper made of old rope and other strong materials is called rope manila.

Kraft Paper. Owing to the high price of manila stock and the lack of strength in the sulphite papers, a sulphate paper was introduced into America from Norway about 1908. This is a dark-brown paper that is very tough, having a hard finish. It is used extensively in making heavy sacks for grain and flour. Bags for the covering of carriages and automobiles have also been made from this paper. By being rolled in narrow strips, a successful twine has been produced with kraft paper. As a commercial wrapping paper it has almost entirely displaced the pure manila product.

Paraffin Paper. In making paraffin paper a machine is used which consists essentially of a container for molten wax or paraffin, which is kept at a uniform temperature by some suitable heating device (in the case of pure paraffin, a solvent such as benzol is frequently used); a glass rod placed practically in the centre of this container, horizontally and parallel with the spool on which the paper is rolled; a steel scraper, and two porcelain rollers. The paper is led from the roll on which it is mounted through the enameled iron trough which contains the molten wax. On being drawn through the trough, the paper is guided by the glass rod which, by its smooth surface, prevents excessive accumulation of wax on the upper surface of the paper and also keeps the paper evenly distributed in the molten wax. Upon leaving the trough, the undersurface of the paper comes in contact with a steel scraper. The surplus wax is thus removed from the undersurface before the paper passes through the two porcelain rollers which act as a wringer and drain out all the surplus wax and also give the paper a uniformly smooth surface on both sides. The paper is then allowed to fold loosely and hang until it dries, when it is ready to be cut into sheets.

Classification. Papers may be classified as follows: 1. *Writing papers*, comprising bond papers, ranging from the best bank-note and stock-certificate to greatly inferior grades, bond in nothing but name; ledger papers, for book-keeping and other fine writing purposes; linen papers, usually with rough surface and laid watermark. Writing papers are known in the trade as flat papers, as opposed to printing papers, which used to be folded in quires, but now are also flat and almost never folded. 2. *Book papers*. 3. *News paper*, usually largely made of ground wood. 4. *Wrapping paper*, rope manila, manila, bogus manila, etc. 5. *Tissue, blotting paper* (unsized), *cover papers*, etc. 6. *Boards* of all sorts, strawboard, box board, news board (made from old printed newspapers), bristol board, etc. (See STRAW, PAPER AND OTHER MANUFACTURES OF.) Pulp is also waterproofed and pressed into rails and many other shapes. It is used for the inside of car wheels.

Sizes. Formerly very many names were in use to designate different sizes of papers, but now they are largely obsolete, especially in America, and standard sizes are being more and more superseded by special orders of odd sizes. The names for the sizes of writing papers are largely the same in the United States and in England, but the sizes differ slightly. A few of the most common are given on the next page, with the sizes of both countries:

NAMES	In United States	In England
Cap	14 × 17	
Demy	16 × 21	
Folio	17 × 22	
Medium	18 × 23	22 × 17½
Double cap	17 × 28	24 × 19¼
Royal	19 × 24	27 × 19¼
Super royal	20 × 28	30 × 22
Imperial	21 × 31	34 × 26
Atlas	26 × 33	40 × 27
Double elephant	26 × 40	

Statistics. In America the tendency has been to combine the pulp and paper mills under a single organization. The census figures of 1909 show that there were in this industry 777 separate mills, of which only 81 were devoted exclusively to the manufacture of pulp. There were 538 which made paper exclusively. Since that census a considerable number of mills making paper alone have built pulp mills. The reason for this change has been largely due to changes in the transportation rates of wood pulp and pulp wood, resulting in added expense for the purchaser of finished pulp. This problem of transportation has also tended towards the elimination of the mill-manufacturing pulp exclusively, as all profits are rapidly dwindling. Since the census several new paper mills have been erected, and others have added new machines materially increasing their output. Together with the new plants and additional paper machines the production of the American mills now equals that of all other countries combined. In 1909 America produced 48.53 per cent of the entire world production. The investment in the paper and pulp industry in America now exceeds \$430,000,000. More than 82,000 persons are employed in the industry, of whom 76,000 are wage earners. The value of all products exceeds \$270,000,000 a year.

In 1909 Congress enacted a Tariff Act materially reducing the duties on paper-making materials and on finished paper. As much of the American trade had grown under a high protective tariff, this change had a material effect on the domestic manufacturer, who had to meet severe competition from Canadian and European mills. In 1913 all paper valued at less than two and one-half cents a pound, which meant newsprint paper, was put on the free list. All wood-pulp and crude-paper stock was also admitted free of duty by the terms of the new Act. Under the Act of 1909 the imports of newsprint were 12,229 tons in 1911. Capital was promptly invested in Canada for the utilization of the enormous forest resources for paper manufacturing, and in 1913 the Canadian mills exported 192,852 tons of newsprint paper, valued at \$7,484,318, to the United States. Under the free tariff of 1913 the Canadian exports to the United States increased to 315,476 tons, valued at \$12,189,792, or practically the entire production of the Canadian mills. The forest conditions in Canada lead many to believe that the newsprint industry will eventually move to that country. American mills produce about 1,200,000 tons of newsprint annually, but the inroads made by Canada in a single year are indicative of an economic revolution in paper manufacturing.

PAPER BOOK. In English law, a book containing copies of all the pleadings and an abstract of all the facts necessary to a complete understanding of a case. A paper book is only required to be filed with the court where the facts are agreed upon or have been determined and the question remaining for decision is one of law only. Where the argument is before a court of original jurisdiction, the facts must have been agreed upon or admitted by the pleadings. Where a case is appealed, the paper book corresponds to what in the United States is usually called the appeal book or case and exceptions. See APPEAL, CASE, PLEADING; PRACTICE.

PAPER HANGINGS. See WALL PAPER.
PAPER NAUTILUS, or **PAPER SAILOR.** The shell of the argonaut (q.v.).

PAPER OFFICE, THE. In Great Britain, the branch of the Public Record Office in which state papers are preserved. It originated in a decree of Queen Elizabeth, who in 1578 established "the Office of Her Majesty's Papers and Records for Business of State and Council." Thirty years later James I. by letters patent under the great seal definitely established the office in the palace of Whitehall. In 1852 the State Paper Office was by an order in council made a branch of the Public Record Office (q.v.).

PAPER PLANT, EGYPTIAN. See CYPERUS; PAPHYRUS.

PAPER SKIN. See LUNGWORM.

PAPER WEDDING. See WEDDING ANNIVERSARIES.

PAPHLAGONIA (Lat., from Gk Παφλαγονία). In ancient geography, a district of northern Asia Minor, bounded on the north by the Black Sea, on the east by Pontus, from which it was separated by the river Halys, on the south by Galatia, and on the west by Bithynia (Map: Rome, F 2). The inhabitants were akin to the Thracians and seem to have preserved a large degree of independence, though recognizing the suzerainty of Lydians, Persians, and Macedonians. Later the country was joined to Pontus and after the Roman conquest was divided between the provinces of Bithynia and Galatia.

It was organized into a separate province towards the end of the third century of the Christian era. The cavalry of the country was famous, and the mountains furnished abundant timber and some metals. The chief city was the Milesian colony of Sinope (q.v.), on the Black Sea. Consult W. M. Ramsay, *Historical Geography of Asia Minor* (London, 1890).

PA'PHO, or **PA'PHOS** (Lat., from Gk. Πάφος). The ancient name of two cities on the southwest coast of Cyprus. The older city, sometimes called Palaipaphos (now Kuklia), was situated about a mile and a quarter from the coast. It was probably founded by the Phœnicians and was the centre from which the worship of Aphrodite spread over the island. Remains of the wall surrounding the temple of the goddess still exist. In Greek legend the goddess was said to have risen from the sea at this point, and even in the Homeric poems it is mentioned as her favorite abode. The form of the shrine of the goddess on Roman coins is strongly reminiscent of the Mycenaean period and points also to the early date of the sanctuary, which was a place of pilgrimage until the overthrow of paganism. The other Papho, called Neopaphos (now Baffo), was on the seacoast, about 7 or 8 miles northwest of the older city, and was said to have been an Arcadian colony. Under the Romans it was the capital of the island and the official residence of the Governor. Consult Oberhummer, *Die Insel Cypren* (Munich, 1903).

PA'PIAS (Lat., from Gk. Πάππας). Bishop of Hierapolis in Phrygia. He flourished during the first half of the second Christian century, but the dates of his birth and death are unknown. He is said by Irenæus to have been a companion of Polycarp and "a hearer of John," but this last is often regarded as incorrect. He wrote in Greek an important work, in five books, entitled *Expositions of the Oracles of the Lord*, which unfortunately has been lost. A few fragments, preserved chiefly by Irenæus and Eusebius, indicate that the work was not itself a gospel, but a sort of running commentary on the sayings (and deeds?) of Christ. They also prove that written gospels already existed. Papias diligently gathered up the primitive Christian traditions, setting a high value upon every direct line of testimony concerning the Lord's teaching.

Eusebius credits Papias with more learning than judgment, which probably means that he disliked his materialistic notions of the approaching millennium, with its alleged miraculous vintages and crops. (Cf. Irenæus, *Against Heresies*, v, 33.) These conceptions, however, were not displeasing to Irenæus and other early Christians, although they were generally discarded before the fourth century. In any event, Papias' reputation does not depend upon his millenarian views. He stands as a connecting link between the Apostolic age and that of the Apologists, a period where our sources at best are scanty and each one correspondingly valuable. He is of especial interest because of his preservation of traditions regarding the gospels of Matthew and Mark (qq.v.).

Bibliography. The fragments of the *Expositions* may be consulted in Lightfoot's *Apostolic Fathers*, edited by Harmer (London, 1893), or in Funk, *Patres Apostolici* (Tübingen, 1901). Crutwell, *Literary History of Early Christianity* (2 vols., New York, 1899); Theodor Zahn, *Forschungen*, part vi (Leipzig, 1900); B. W. Bacon, *The Fourth Gospel* (New York, 1910).

PAPIER-MÂCHÉ, pâ'pyá-mâ'shâ' (Fr., pulped paper). A tough, plastic material, made from paper pulp, or from paper that has been reduced to a pulp, mixed with glue, paste, oil, resin, or other sizing. It has been in use for more than a century in Europe, and it is not improbable that it was first suggested by some of the beautiful productions of Sind and other parts of India, where it is employed in making boxes, trays, etc., as well as in China and Japan. Its first application, so far as we know, was to the manufacture of snuffboxes, by a German named Martin, in 1740. Properly speaking, papier-mâché is paper pulp molded into shape, and it has been used not only to make small articles, such as boxes, trays, etc., but in the interior decoration of houses for cornices, ceilings, etc. From the extension of the application of papier-mâché to the manufacture of a number of light and useful articles, modifications have taken place in its composition, and it is now of three kinds—first, the true kind, made of paper pulp; second, sheets of paper pasted together after the manner of pasteboard, but submitted to far greater pressure; and third, sheets of thick millboard cast from the pulp, which are also heavily pressed.

PAPIL'ION'IDÆ. A family of large butterflies. See SWALLOWTAIL.

PAPILLA (Lat., nipple). A term applied by anatomists to one of several minute, elongated, conical processes, projecting from the surface of the true skin into the epidermis, highly vascular and nervous in their character, and taking an active part in the sense of touch. Their form and structure are described in the article SKIN. The term "papilla" is also used to designate the optic disk or nerve head as observed through the ophthalmoscope. See OPHTHALMOSCOPE.

PAPILLO'MA (Neo-Lat., from Lat. *papilla*, nipple + *-oma*). A new growth somewhat resembling a normal papilla and appearing either on the skin or mucous membrane or at the mucocutaneous junction. The term is loosely applied to warts, corns, and certain nævi. The hard form contains much dense connective tissue and few cells and grows chiefly upon the skin. The soft form appears on mucous membranes and is seen typically in the larynx, bladder, rectum, and uterus. See TUMOR.

PAPIN, pâ'pân', DENIS (1647-?1712). A French physicist. He was born Aug. 22, 1647, at Blois, where, after studying medicine, he practiced for some time as a physician. His devotion to study and research in physical science dates from his acquaintance with Huygens, and he soon after became the pupil and assistant of this famous physicist, contributing substantial improvements to the air pump. He rapidly acquired a wide reputation and visited England, where he was received with open arms by the philosophers of that country, and became a member of the Royal Society in 1680. While in England, Papin and Robert Boyle worked together and performed many experiments, Papin inventing the double air pump and the air

gun during this period. To him is also due the idea of pneumatic transmission of power, but he was not able to make a practical use of his method. In 1687 Papin was called to the chair of mathematics in the University of Marburg in Hesse-Cassel, the duties of which office he discharged with zeal and success for many years. He died sometime between 1710 and 1714, very poor and in complete obscurity. To Papin belongs the high honor of having first constructed a steam engine with a piston (1690), and he also used the simple method of condensing the steam to produce a vacuum beneath the raised piston. He is also the inventor of the safety valve, which was an essential part of his digester (q.v.). With this latter machine Papin showed that liquids under reduced atmospheric pressure would be made to boil at a much lower temperature than when freely exposed to the air. Papin discovered the principle of action of the siphon, improved the air pump of Otto von Guericke, and took part in philosophical discussions with Leibnitz. In 1690 he constructed a paddle-wheel boat in which his pumping engine was used to raise water which turned a water wheel connected with the paddle. It was destroyed by a mob on account of its interfering with the business of the boatmen. Many of Papin's numerous writings will be found in the *Philosophical Transactions, Acta Eruditorum*, and the *Recueil de diverses pièces* (1695). He published an explanation of the construction and uses of his digester (London, 1681), afterward (1682) translated into French, and his experiments entitled *Nouvelles expériences du Vuide* (Paris, 1674; reprinted, Paris and Blois, 1869). It was not for nearly a century after his death that the great value of Papin's experiments and researches was perceived. For Papin's work connected with the steam engine, consult Thurston, *Growth of the Steam Engine* (New York, 1878); for his life, E. Gerland, who gives also his correspondence with Leibnitz and Huygens (Berlin, 1881); for brief descriptions of some of his machines, Gerland and Trau-müller, *Geschichte der physikalischen Experimentierkunst* (Leipzig, 1899).

PAPINEAU, pá'pé'nó', LOUIS JOSEPH (1786-1871). A Canadian orator and political agitator. He was born at Montreal, Oct. 7, 1786, received his education at the Seminary of Quebec, subsequently studied law, and was admitted to the bar in 1810. In 1809 he was elected to represent the constituency of Kent in the Legislative Assembly of Lower Canada and in 1811 was chosen to sit for one of the districts of Montreal. During the War of 1812 he was the commander of a company of militia, but saw little active service. In 1815, as the leader of the French-Canadian party, he was chosen Speaker and continued to hold that position until 1837. He had frequent conflicts with the royal governors, and in 1827 Lord Dalhousie refused to accept him as Speaker, but the Assembly insisted, and Dalhousie resigned. In an effort to force the home government to make the Provincial Council elective instead of appointive, the Assembly under his lead refused to grant supplies to the Governor and in 1834 transmitted to England the famous Ninety-two Resolutions. Affairs now became more and more critical, and in 1835 Papineau arranged with William Lyon Mackenzie, the leader of the Revolutionary party in Upper Canada, for coöperation between their followers. In March, 1837, the English government finally

declared that an elective council could not be granted and authorized the Governor, since the Assembly still refused to vote supplies, to use the money in the treasury. A proclamation was issued warning the people against agitators, and, because of Papineau's violent harangues to the people, he was deprived of his captaincy in the militia. In October, 1837, he attended at St. Charles a meeting of delegates from the counties of Lower Canada which decided upon revolution, though there has been much dispute as to whether he favored this action. Certain it is, however, that when the rebellion, the way for which he had prepared, broke out, he fled to the United States, where he remained for two years. He then went to France, but in 1847 took advantage of a general amnesty and returned to Canada. He was soon afterward elected to a seat in the Lower House of the now united Canadian Parliament, but found that his old influence had departed. He retired from the public service in 1854 and spent the remainder of his life in seclusion at his residence of Montebello on the Ottawa River. He died Sept. 24, 1871. Consult: William Kingsford, *History of Canada* (Toronto, 1887-98); Robert Christie, *History of the Late Province of Lower Canada* (Quebec, 1848-55); D. B. Read, *The Canadian Rebellion of 1837* (Toronto, 1896); A. D. De Celles, *Papineau-Cartier* (ib., 1904).

PAPINI, pá-pé'né, GIOVANNI (1881-). An Italian philosopher. He was born at Florence, where he founded the review *Leonardo*, which he edited and for which he wrote under the pen name of Gian Falco. He contributed to many other periodicals and is author of *Il crepuscolo dei filosofi*; *La coltura italiana*, with Prezzolini; *Il tragico quotidiano: favole e colloqui* (1906); *Il pilota cieco* (1907); *L'Altra metà: saggio di filosofia mefistofelica* (1911); *Le memorie d'Iddio* (1911). William James characterizes Papini as the leader of Italian pragmatism, who "grows fairly dithyrambic over the view that it [pragmatism] opens of man's divinely creative function."

PAPINIANUS, ÆMILIANUS. A Roman jurist, a contemporary, friend, and trusted adviser of the Emperor Septimius Severus. He was probably of Syrian-Greek origin, was born about 146 A.D., became praetorian prefect or Chief Justice of the Empire in 203, and was put to death in 212 because (it is said) he refused to justify Caracalla's murder of Geta. He was the greatest of the Roman jurists. More than any other, he strove to keep law in harmony with ethics. In Valentinian's Law of Citations (426) that Emperor directed that if an equal number of authorities were produced on either side of a disputed question the opinion supported in Papinianus' writings should prevail. Both before and after Justinian's time the works of Papinianus formed an important part of the third year of legal study, and the students of that year were called Papinianistæ. His principal published works were digests of decisions: 37 books of "questions" and 19 of "responses." Because he left no systematic commentaries, Justinian's codifiers drew less largely on his writings than on those of Ulpian and Paul, but excerpts from his works constitute an important part of the Digest. Outside of the Digest we have a passage from Papinianus which was included in the Breviary of Alaric (q.v.) and a few fragments of his responses found in Egypt in 1877 and 1882. These have been printed by

Huschke. Consult Otto, *Papinianus* (2d ed., 1743), and the article "Æmilius, 22," in Friedrich Lübker, *Reallexikon des Klassischen Altertums*, vol. i (8th ed., Leipzig, 1914); E. Manson, *Great Jurists of the World* (Boston, 1914).

PAPINIUS STATIUS, PUBLIUS. See STATIUS, PUBLIUS PAPINIUS.

PAPIRIVS, LUCIUS, surnamed CURSOR from his swiftness of foot. A Roman general. He was appointed dictator to carry on the second Samnite War in 325 B.C., but treated his soldiers so harshly that at first they allowed themselves to be defeated. Later he won their good will, and captured the town of Luceria. When the Samnites again revolted in 309 B.C., Cursor was, for a second time, appointed dictator, and won a decisive victory at Longula, for which he was granted a triumph. Cursor was chosen consul five times. His son of the same name completed the subjection of the Samnites (272 B.C.).

PAPIST PLOT. See OATES, TITUS.

PAPPENHEIM, pāp'pen-him, GOTTFRIED HEINRICH, COUNT (1594–1632). One of the leading Imperialist generals in the Thirty Years' War. He was born at Pappenheim, Bavaria, May 29, 1594, of an old and distinguished Swabian family. He studied at Altdorf and Tübingen and early identified himself with the Catholic cause. He served under the Poles against the Russians and Turks, was in the service of the Catholic League in 1620, and at the battle of the White Hill in the same year contributed greatly to the victory over the Bohemian forces. He was in 1623 made commander of the mounted regiment which became famous as Pappenheim's cuirassiers, or Pappenheimers. He was a cavalry commander in the Spanish service in Lombardy in 1625–26, but rejoined the Imperialist army in the following year, suppressed a revolt of the Protestant peasants of Upper Austria, and then was engaged under Tilly in the campaigns against the Danes, Swedes, and Saxons. He took a prominent part in the storming of Magdeburg (1631) and was engaged at Breitenfeld (1632). Although he covered the retreat of the defeated army in a masterly fashion, the defeat was largely due to his foolhardiness on the battlefield. He served under Wallenstein in the final campaign against Gustavus Adolphus. Just before the fateful battle of Lützen he had been detached with eight regiments for an independent movement, but a recall was sent after him when the rapid advance of the Protestant leader became known to Wallenstein. His splendid charge on the left wing of the Swedish army had almost changed the result when he was mortally wounded. He died the next day at Leipzig, Nov. 17, 1632. Consult Hess, *Gottfried Heinrich, Graf zu Pappenheim* (Leipzig, 1855).

PAPPUS (Neo-Lat., from Gk. πάππος, down, from *páppos*, pappos, grandfather, from *páppas*, pappas, father, papa). The peculiar calyx of the Compositæ. The flowers are placed close together in the flower head. As a consequence, the sepals are not necessary for protection and for mechanical reasons are probably prevented from developing in a normal way. Moreover, the flowers are epigynous, so that the sepals are developed from the top of the seedlike fruit (achene, q.v.). In many cases the sepals (pappus) are entirely obsolete, in others they form a shallow cup or crown, in others they are arranged as teeth or scales, while in still others they constitute a tuft of bristles (a) or hairs (b). It is this last form of pappus which, as in

the dandelions, thistles, etc., is a conspicuous character of the family. The hairlike pappus is exceedingly diverse in details of structure, in some cases being coarse and bristly, others soft and silky, and others beautifully plumose. In

ACHENES.

a, *Artemisia*; b, *Sonchus*, or sow thistle; c, *Taraxacum*, or dandelion.

the dandelion (c) the achene develops a long beak at the summit of which the tuft of soft pappus hairs occurs. In case the pappus has any special development it is associated with the dispersal of the seeds. For example, the hairy pappus of thistles and dandelions enables the fruit to be carried by currents of air, while the toothed and even barbed pappus of Spanish needles serves as a grappling appendage by which the fruit may lay hold of animals brushing past.

PAPPUS, or **PAPPUS** (Lat., from Gk. Πάππος) (c.300 A.D.). An Alexandrian mathematician. He is said to have written on geography and astrology, to have composed a commentary on the *Almagest* of Ptolemy, and to have been the head of a school. His principal work, however, was the *Μαθηματικὰ Συναγωγαί* (*Mathematicæ Collectiones*) in eight books, the first and half of the second of which are lost. To this work we owe much of our knowledge of Greek mathematics, and the translation of six of these books into Latin by Commandino (1588) had a powerful influence on the renaissance of geometry in the seventeenth century. In particular, the geometry of Descartes had for one of its principal objects the solution of a problem of Pappus, viz., given $2n$ straight lines, to find the locus of points such that the product of the distances of each of these to n of the lines (or more generally of straight lines at given angles to the n lines) shall have a given ratio to the product of the distances (or lines at given angles) to the other n . Pappus was the last of the great Greek mathematicians, but the value of his work is largely due to the fact that it gives to us numerous extracts from the lost writings of his predecessors. The most important theorem due to him is the one often called by Guldin's name, viz., the volume of a solid of revolution is equal to the product of the area of the revolving plane figure and the length of the path of its centre of gravity. Numerous minor propositions bear his name, such as the Pythagorean theorem as generalized for an oblique-angled triangle, in which the squares on the sides are replaced by parallelograms. The text

of Pappus has been edited by Hultsch (3 vols., Berlin, 1876-78, Greek and Latin).

PAPRIKA, pǎ'pré-ká (South Slavic, pungent). 1. A condiment derived from one or more of the less pungent peppers of the genus *Capsicum* (q.v.). 2. The name of the peppers yielding the condiment. The original pungent, highly colored, and very aromatic paprika of Hungarian origin is prepared from the whole pod, including the seeds and placentæ. In the American trade, however, paprika frequently refers to a condiment prepared from the walls of the pod alone. Another form of paprika, often called Spanish paprika, is made from a highly colored, nonpungent sweet pepper of Spanish origin.

Consult Young and True, "American Grown Paprika Pepper," in United States Department of Agriculture, *Bulletin No. 43* (Washington, 1913).

PAPUA, pǎ'pōō-ä or pǎp'û-ä, TERRITORY OF. The British possessions in the southeastern part of the island of New Guinea (q.v.) with islands between lat. 8° and 12° S., and long. 141° and 155° E. (Map: East Indies, K 7). The islands, which include the D'Entrecasteaux Archipelago and the Louisiade group, have an area of 2754 square miles. The mainland area is 87,786 square miles. The latter adjoins on the west the Dutch territory and on the north Kaiser Wilhelms Land. The Territory of Papua extends from east to west upward of 800 miles, and about 200 from north to south towards either end, but is only about 50 miles deep behind Freshwater Bay, near the middle of the portion of the colony that is situated on the island of New Guinea. The total coast line of the possession has been computed at 3664 statute miles, 1728 on the mainland and 1936 on the islands. The territory has been a part of the British dominions since 1888, and since Sept. 1, 1906, it has been administered as a territory of the Australian Commonwealth. The Great Australian Barrier Reef can be traced around the Gulf of Papua and along the southeast coast, including the islands of Kiriwana, Nada, and part of Murua; most of the islands, however, are mountainous and principally of schistose formation, the highest, Goodenough, 8000 feet. The eastern of the mainland part of the colony is also mountainous, and as the mountains extend westward they rise and coalesce to form a massive central chain which attains its highest altitude in the Owen Stanley Range, the highest point of which is Mount Victoria, 13,121 feet, and in Mount Scratchley, the Wharton Range, and Mount Albert Edward, the latter about the same height as Mount Victoria. Farther west the main range becomes more broken and lower, while pursuing nearly the same general trend towards the northwest as it had in the more western part of the colony. The western end of the possession is for 300 miles generally low and swampy until a long distance from the coast is reached. On the Fly River near the junction of British, Dutch, and former German territory, there are limestones with fossil corals, and these are also met with at many other places in the low and swampy regions of the western end of the colony and elsewhere, and the stagnant waters breed fever-bearing insects, so that at present it is dangerous to live along the coasts. The whole possession is remarkably well watered. The great mountains and by far the larger portion of the lower country are all covered by forest.

The great majority of the principal rivers open into the Gulf of Papua. The two largest are the Fly and Purari. The Fly spreads out its head branches over a large area in the centre of the island, comprising considerable portions of the three different territories. Its course is about 620 miles from the sea to the British-German boundary. It is navigable by steam launch for over 500 miles and for 600 miles in small boats. The Purari is navigable for 120 miles.

Climate. The climate of the lower part of the country is warm. At Port Moresby, the seat of government, which is situated near the middle of the colony, the average annual temperature is about 80° F., the average maximum is about 86° F., and the minimum about 75° F. The hot season is from November to May, the hottest months being January and February; the cold season is from June to October, the coldest month is August. During the hot season winds on the south coast are from the north and west and are unsteady; during the cold season they are from the southeast and are much more regular. The rainfall at Port Moresby during 1912-13 was 41.05 inches. It is much greater, but undetermined, on the central mountain ranges. On the south coast the climate is rather comfortable than oppressive during the cold season; it is generally agreeable at an altitude of 3000 feet, a height that can be reached in one day from Port Moresby, and at 13,000 feet ice forms.

Fauna and Flora. There are no dangerous wild beasts in the colony; wild swine are common; there are several varieties of wallaby, phalanger, echidna; there are no deer, hares, or rabbits. The most dangerous creature is the crocodile; many lives are lost each year through these amphibians and by snake bite. The snakes are nearly related to those of Australia, although a number are peculiar to the island. The birds, of which there are over 500 species, include the cassowary, many birds of paradise, a great variety of pigeons, the hornbill, the black and white cockatoo, geese, many species of ducks, quail, snipe, woodcock, plain turkey, and plain hens.

The flora is as varied as the climate. On the tops of the highest mountain chains there are many species of grasses, several kinds of buttercup, forget-me-nots, daisies, rhododendrons, heaths, and other flowers of temperate climates. The forest there is principally cypress; from 7000 to 10,000 feet it is chiefly myrtaceous, often covered by trailing bamboo or mixed with pandanus. From 2000 to 5000 feet the evergreen oaks are common. On the lowlands there are several varieties of hardwood trees—afzelia, bijuga, calophyllum, etc. In general the interior contains the dense forests, while the shores have in many places grass lands dotted with eucalyptus trees. Native cloth is made by beating out the bark of the paper mulberry, of the breadfruit tree, or of certain trees of the nettle family. Fibre is obtained from the banana, the coconut, from the bark of many saplings, and the best of all from the aerial roots of certain species of pandanus. Most of the trees and flowers that are met with in the tropical islands of the Pacific or in north Queensland occur also in Papua.

The climate is favorable to the cultivation of all tropical products. The coconut palm bears well everywhere and is common along the coast

line, but in the far interior it is not met with. It is being extensively planted every year. Cotton would be specially suited to the climate of the central district. Tobacco and sugar cane seem to be indigenous. There are several native trees and plants that yield good classes of rubber, also some good varieties of timber, including sandalwood, ebony, and cedar, in most cases easily accessible by river. Tea, coffee, and cocoa thrive well, but are not indigenous; the latter has been introduced and propagated free of disease and does not seem to have any special local enemy. The climate is very congenial to rice and maize and all kinds of tropical fruit. The marine resources comprise pearl shell and pearls, trepang, sponges, and turtle shell.

People. Racially the natives of Papua belong to at least two indigenous types, the Pygmy and Papuan. In addition we have to deal with relatively recent Melanesian immigrants into both German and British New Guinea, where they have, generally speaking, ousted the autochthonous Papuans from islands and coastal districts. In a broad classification Melanesian and Papuan would have to be classed as subdivisions of a single race. Both are essentially frizzly-haired, but among the Melanesians curly and even wavy hair is not uncommon. The Papuan has a higher and longer head (index, 76-77), with stronger development of brow ridges, more retreating forehead, and a longer, stouter, and more decidedly arched nose; the color of his skin is darker, ranging from a dark chocolate to a sooty brown. The stature of the Papuans varies considerably in different regions. Measurements at Wakatimi and Parimau, Dutch New Guinea, by Wollaston yielded an average of about 167 (5 feet, 6 inches); in German New Guinea Neuhauss found the mean stature of coastal peoples to be between 155 and 165 centimeters, while other travelers give a general average of 155.5 centimeters.

Compared even with this lowest figure for Papuans, the measurements secured at certain localities are so low that, supported by additional anatomical evidence, they have been taken as indications of a once distinct Pygmy race now more or less merged into the Papuan population. Thus, Pösch found a mean stature of only 152.5 centimeters in the Kai area, with 12 adult males ranging from 133 to 145.6 centimeters (4 feet, 4½ inches to 4 feet, 9¼ inches). In the same area Keysser obtained an average of 153.9 centimeters for adult males, with 73 of 273 individuals below 150 centimeters, while over 300 women averaged only 144.4 centimeters. Neuhauss pointed out various other Pygmoid traits in this population, such as the unusually small lobes of the ear, convex upper lip, and relative shortheadedness (index, 79-80). However, convincing evidence of a definite tribe of Pygmies, as opposed to mere Pygmy strains in Papuan peoples, was discovered by the Wollaston expedition only in Dutch New Guinea. The tribe in question, named Tapiro, is characterized by short, woolly, and black hair; relatively light color of the skin; a mean stature of 1.449 meters (4 feet, 9 inches), the shortest individual being only 1.326; a cephalic index of 79.5; and convexity of the upper lip. On the basis of these discoveries Haddon recognizes a Pygmy race in New Guinea, related to woolly-haired and broad-headed Negrito of the Andaman Islands, the Malay Peninsula, and the Philippines.

Two entirely distinct groups of languages exist in Papua, the Melanesian and the Papuan. The Melanesian languages of the island are closely related to one another and to those spoken in Melanesia, e.g., in the Solomon Islands and New Hebrides, the Melanesian languages of both areas representing an older and fuller form of speech, of which the Polynesian is a later and simplified offshoot. While the Melanesian languages thus form a uniform stock, those designated as Papuan differ so widely as to be not merely mutually unintelligible but even to present radically distinct morphological traits. The term is therefore based mainly on negative features and is equivalent to non-Melanesian-Polynesian. There is some similarity with Australian languages, but not sufficient to prove affinity.

Culturally the natives of Papua differ almost as much as in point of speech. Until the coming of the whites all lived in the Stone age, but were able to execute extraordinary carvings with the aid of their crude implements. They are primarily agriculturists and vegetarians, subsisting on taro, yams, bananas, coconuts, sago, and the breadfruit. Pigs and dogs have been domesticated. Hunting is relatively unimportant, but fishing is extensively practiced. The form of habitation varies, but pile dwellings are exceedingly common. In many localities there are large structures serving at the same time as a sleeping place for the young men, as a council house, and as a ceremonial hall. Pottery occurs sporadically. The spear, bow and arrow, and club form the principal weapons; in some districts spears are hurled with the spear thrower. Shields are widely diffused. No general statement is possible as to social organization and religious beliefs; in some tribes, e.g., between Dallmannhafen and Berlinhafen, totemism with exogamy has been recorded. The nonmaterial aspects of Papuan culture are only beginning to become known.

Government. The natives have developed no system of government worthy of the name. A certain loose patriarchy exists, but its authority is generally limited to the family. The British administration exercises control over the natives largely through native village policemen, who number about 550.

In 1883 Queensland proclaimed the territory's annexation, which, however, was disallowed by the British government. But in the following year the establishment of a British protectorate was announced; this was subsidized by Queensland, New South Wales, and Victoria until September, 1888, when it became a British possession, receiving the constitution of a crown colony, in association, however, with Queensland. Port Moresby was made the official headquarters; a supreme court was established there, and magisterial courts in other places. Pursuant to letters patent of 1902, accepted by a Commonwealth Act of 1905, the territory passed to the administration of the Commonwealth government Sept. 1, 1906. Its name at this time was changed from British New Guinea to Territory of Papua. The territory did not become a part of the Commonwealth. Administration is in the hands of a lieutenant governor, who is assisted by an Executive Council of six official members. There is a Legislative Council consisting of the Executive Council and of three unofficial members. The territory is divided into 11 magisterial districts; in each is a resident magistrate,

invested not only with judicial but with certain executive and administrative powers.

Local revenue increased from £19,274 in 1904-05 to £34,822 in 1909-10 and £54,703 in 1913-14. The expenditure in 1913-14 was £81,095, the deficit being covered by Commonwealth grant.

Production, Commerce, etc. Rich soils at varying elevations and, in most districts, abundant rainfall make possible the successful cultivation of nearly every tropical product. In 1913 there were 216 plantations, of which the aggregate area under cultivation was 35,363 acres; of this acreage, 21,958 acres were planted to coconuts, 6256 to rubber, and 3057 to hemp. Other cultures are cotton, coffee, vanilla, cacao, tea, and tobacco. To insure adequate food supply for the natives, the latter are compelled to plant coconuts; the area so planted amounts to about 350,000 acres. Valuable indigenous products include sandalwood and other timber, rubber, sugar cane, bananas, various spices, breadfruit, sago, nuts, fruits, etc. Little progress has been made in stock breeding. The introduction of rabbits, hares, foxes, and monkeys is prohibited.

Many metallic minerals are widely distributed, and there are both coal and petroleum. Gold was discovered in 1888, and up to June 30, 1913, the amount won was valued at £1,291,670; the yield in 1909-10 was £60,181, in 1912-13, £64,115. About 150 whites and 800 indentured laborers are engaged in gold mining, which is chiefly alluvial. After gold, copper forms the most valuable mineral yield. The pearl-shell fishery is an important industry, and bêche-de-mer is found on most of the reefs. There are no European manufactures. Native manufactures include pottery, mats, fishing nets, canoes, shell ornaments, decorated gourds, and stone implements.

Imports and exports were valued in 1904-05 at £67,188 and £76,435 respectively; in 1909-10, £120,177 and £100,599; in 1913-14, £212,134 and £123,140. The principal imports are foodstuffs, textile goods, and clothing, iron wares and machinery, building materials, and tobacco. Up to the year 1911-12 more than half the export value represented gold. In that year the gold export was £49,316 and, in 1913-14, £41,222. Copper ore was exported in 1912-13 to the value of £18,997; copra, £16,912; pearls, £9284; pearl and turtle shell, £8842; hemp, £3039; bêche-de-mer, £1871; rubber, £517. Trade is chiefly with Queensland and New South Wales. Ports of entry are Port Moresby (pop., about 1600 natives and 425 whites), just east of 147° E.; Samarai, an island of some 60 acres, with good anchorage, off the southeast end of the mainland; Daru, also a small island, with good harbor, near the mainland a little east of 143° E.; and Bonagai, in Woodlark Island. There are substantial wharves at Samarai and Port Moresby, which has a large and sheltered harbor. Internal communications are largely by river. Four missionary societies are represented in the territory. The population was estimated in 1914 at 250,000 Papuans and 1186 Europeans.

Bibliography. General description: Sir C. R. Markham, "Progress of Discovery on the Coasts of New Guinea," in Royal Geographical Society, *Papers* (London, 1884), contains a list of early discoverers; H. H. PAPUAN BIRD OF PARADISE. See Colored Plate of BIRDS OF PARADISE.

PAPUANS. See PAPUA.

PAPUAN or AUSTRO-MALAYAN SUBREGION. In zoogeography, a northern subdivision of the Australian Region, formed of the islands eastward of Wallace's Line to San Cristoval, embracing Celebes, Lombok, the Gilolo group, Ceram, New Guinea, and the Solomons. All are mountainous, well forested, hot, and damp, excepting the small arid group from Lombok to Timor. Considering the proximity and physical resemblance of these islands to those west of them, and their dissimilarity to the continent of Australia, it is surprising to find that their affinities are Australian rather than Oriental. The mammals are almost wholly marsupials, with one monotreme (see ECHIDNA) in New Guinea. A long list of peculiar genera of birds may be made, and this subregion is the special home of the birds of paradise, honey suckers, some peculiar flycatchers, and a host of most brilliant parrots, kingfishers, and pigeons. The extraordinary tendency towards ornamentation which characterizes the birds of these islands extends also to the insects and has been the object of much speculation. Consult: A. R. Wallace, *Geographical Distribution of Animals*, vol. i (New York, 1876); H. O. Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (ib., 1885); A. R. Wallace, *Malay Archipelago* (new ed., London, 1906).

PAPUAN WREATHED HORNBILL. See Plate of HORNBILLS AND TOUCANS.

PAPULE (Lat. *papula*, pimple, pustule). A medical term applied to a small elevation of the surface of the skin containing no fluid. Papules are either of the normal skin color or red. If they become filled with fluid, they are called vesicles. If pus develops in a vesicle, it is called a pustule. Papules appear in the early stage of many skin diseases and form the eruption in certain other diseases, as scarlet fever, chickenpox, and smallpox. Papular skin diseases include lichen, prurigo, and pityriasis (qq.v.).

PAPWORTH, pāp'wūth, WYATT ANGELICUS VAN SANDAU (1822-94). An English architect and antiquary, born in London and trained in the offices of his father and of Sir John Rennie. He made a special study of the authorship of English mediæval buildings, won a silver medal in 1849 for an essay on Palladian architecture, and thereafter contributed frequently to the *Transactions* of the Royal Institute of British Architects (of which he became fellow in 1860). Wyatt Papworth is best known for the *Dictionary of Architecture* (8 vols., 1853-92), which he edited for the Architectural Publication Society. In 1893 he became curator of Sir John Soane's Museum in Lincoln's Inn Fields, London.

PAPYROGRAPH. See COPYING MACHINES AND PROCESSES.

PAPYRUS (Lat., from Gk. *πάπυρος*, papyrus). A genus of plants of the natural order Cyperaceæ. Egyptian papyrus (*Cyperus papyrus*) is a kind of sedge, 3 to 10 feet high, with a very strong, woody, aromatic, creeping root, long, sharp-keeled leaves, and naked, leafless, triangular, soft, and cellular stems, as thick as a man's arm at the lower part, and at their upper extremity bearing a compound umbel of extremely numerous drooping spikelets with a general involucre of eight long filiform leaves. It is now extinct in Lower Egypt, but is still

EGYPTIAN PAPYRUS.

found in the upper Nile. The plant is represented in the oldest Egyptian monuments as reaching the height of about 10 feet. The papyrus was used for many purposes. The more slender stalks were woven into baskets and boxes, while bundles of the thicker stalks formed the material of which light boats were constructed. The fibre was used for making cordage, sails, awnings, and matting. The pith was boiled and eaten by the poorer classes, and the root was dried and used as fuel. The most important use of the plant, however, was

to which the natural gum of the plant gave a homogeneous character, and the sheet when dried was ready for use. It is possible that artificial paste was sometimes used to bind the fibres. When newly prepared the sheet was white or brownish white; but in the process of time those papyri which have reached the present day have become of a light or dark brown color and exceedingly brittle. The papyrus or paper of the Egyptians had a great reputation in antiquity, and it appears on the earliest monuments in the shape of long rectangular sheets, which were rolled up and tied with a string. At a very late period the papyrus was no longer rolled, but was cut into square pages which were bound together as are the leaves of a modern book. The papyrus sheets and rolls vary in size, from 9 to 15½ inches in height and from 5 to 9 in width, the larger dimensions being very rare. The strips seem to have been sold in lengths of about 20 sheets, but there is no limit to the length of the rolls, though for literary purposes the Greeks seem rarely to have exceeded 30 feet. The ancient Egyptians made up huge rolls—one is said to be 144 feet long—for burial with the dead, though there is little likelihood that such unwieldy volumes were used by the living. The writing is regularly in columns, parallel to the length of the roll, and of varying width, in literary prose rarely exceeding 3 inches, though in verse they are often wider to accommodate the longer lines of the hexameter. Public documents and private papers are of course bound by no such rules. The use of papyrus paper, or at least of some similar manufacture from vegetable fibre, must have arisen at an early date in Egypt, and the oldest datable specimen can be but little later than 3600 B.C. (For a description of the Egyptian papyri and their contents, see *Literature and Science* under EGYPT.) The Greeks seem to have known a paper as early as the beginning of the fifth century B.C., though the oldest extant Greek papyrus is perhaps the *Persians* of Timotheus, belonging to the end of the fourth century. With the growth of the Alexandrian Library and the spread of Greek learning the use of papyrus largely increased, and the manufacture of the paper seems to have developed greatly under the patronage of the Ptolemies. It is only in comparatively recent years that the attention of scholars and explorers has been drawn towards the Greek papyri of Egypt and that systematic search has been made for them. The great bulk of the enormous mass of papyri brought to light consists of nonliterary documents, partly public, such as official correspondence, laws, petitions, and tax receipts, and partly private, including wills, contracts, letters, and notes, school exercises, and accounts. These documents are of immense value as enabling us to reconstruct the life and language of the common people in the towns and villages of Egypt under Greek and Roman rule. Though the literary papyri are relatively few, they are often of great importance as restoring to us works formerly lost. Among the more important are the *Orations* of Hyperides, the *Mimes* of Herondas, the *Odes* of Bacchylides, the treatises of Aristotle on the Constitution of Athens, and the *Persians* of Timotheus. Of Christian writings the yield has not been large nor of very striking value. There are a few fragments from the New Testament and the Septuagint, some scraps of apocryphal or heretical writings, and especially the interesting leaf from Oxyrhynchus

containing some Logia or sayings attributed to Jesus. The first great discovery of papyri in Egypt was made near Arsinoë in the Fayum in 1877. Fifteen years later at Socnopoei Nesos, also in the Fayum, another rubbish heap was opened, most of whose contents went to Berlin. While the first mass was chiefly Byzantine, these were Roman and on the whole in fair preservation. An earlier period, extending well into the third century B.C., was revealed by the discovery by Flinders Petrie of a series of mummy cases made of old papyri pasted together. Patient labor separated these fragments and brought to light remnants of the lost *Antiope* of Euripides, as well as bits of the *Gorgias* and *Phaedo* of Plato, and many nonliterary fragments. All previous discoveries were surpassed by the work of Grenfell and Hunt at Oxyrhynchus in 1896-97, and to their continued labors at other points in the Fayum and especially at Tebtunis a large part of the increase since then is due. Outside of Egypt discoveries of papyri have been almost unknown. In 1753 a great mass of charred rolls were found in the Villa Suburbana at Herculaneum, and a few of these have been unrolled by means of a very delicate apparatus, but their contents have been a disappointment, as they have proved to be philosophical treatises of the Epicurean school, though the fragments of Philodemus have added somewhat to our knowledge of the history of ancient philosophy. For the handwriting on papyri, see EGYPTOLOGY; PALEOGRAPHY.

As a matter of scientific interest experiments in the manufacture of paper from the papyrus have been made in modern times by Landolina, Seyffarth, and others, and a small quantity is made at Syracuse in Sicily.

The papyrus plays an important part in Egyptian decoration and architecture. The peculiar swelling of the shafts of columns at the base and their upward taper, the wrapping leaves painted on their lower parts, and the form and ornamentation of the campaniform capitals are clearly derived from the papyrus. Whether the "bud" capitals represent lotus buds or closed papyrus umbels is a debated question. Papyrus thickets are frequently represented in mural pictures, and the common Egyptian torus seems to represent bundles of papyrus stalks.

Other species of papyrus (*Cyperus Corymbosus*, *Cyperus tectum*) are much used in India for mats. *Cyperus alternifolius*, the umbrella plant or umbrella palm, is a common house plant. It grows to a height of 1 to 3 feet, with drooping involucre rays 6 to 8 inches long and less than ½ inch broad.

A periodical devoted to this subject is the *Archiv für Papyrusforschung und verwandte Gebiete* (Leipzig, 1900 et seq.); and a brief review of the more important publications of each year may be found in the *Annual Archaeological Reports of the Egyptian Exploration Fund* (London, 1883 et seq.).

PAPYRUS, THE ORBINEY. See EGYPT, *Literature and Science*.

PAPYRUS, THE TURIN. See TURIN PAPYRUS.

PAPYRUS LETTERS. The need for some reliable means of communication between persons situated at a distance from one another is so universal that one naturally would be led to believe that the writing of letters was as well known to the ancient Greeks as to other peoples of antiquity and to ourselves at the present time. The Tell el Amarna letters, written by certain Babylonian kings and governors of Phoenicia and Palestine to the Pharaohs of Egypt about 1400 B.C., show how early we have evidence for the writing of letters in ancient times.

For Greece, however, the earliest reference to epistles is found in the *Iliad* (vi, 169), where the story is told that Proteus, wishing to get rid of Bellerophon (with whom the former's wife had fallen in love), sent him to Iobates, the King of Lycia, with sealed instructions that he should be put to death. This, of course, is but a reference to the practice of letter writing. Considerably later comes another allusion to letter writing in Herodotus (v, 25). Here a curious tale is told of Histæus, who, wishing to urge Anaxagoras to revolt and not daring to communicate with him by the ordinary form of letter, shaved the head of a faithful slave, tattooed the letter upon the scalp, and, after allowing the hair to grow again, dispatched the slave to Anaxagoras. From about the same time come the most notorious examples of letter writing, perhaps, in the supposititious letters of Phalaris, tyrant of Agrigentum. Until the time of Bentley (*Epistles of Phalaris*, London, 1883) these had been accepted as genuine. This scholar showed them to be forgeries; but since they are believed to be by Atossa, Queen of Persia, the antiquity of the collection is still admitted.

Then one comes to the letters of Isocrates, who is said on one occasion to have been taken by the General Timotheus to look after his correspondence (*Plutarch*, x, orat. 4, 9). The preserved letters of Isocrates, while observing epistolary form, are in fact philosophic and oratorical productions destined undoubtedly for publication. The same is true of the letters of Dionysius of Halicarnassus.

Quite different, on the other hand, is the letter sent by Philip of Macedon to the Athenians with a view to setting before them his reasons for declaring war against them. This letter, which begins with the ordinary salutation "Philip to the Senate and People of Athens," is a true illustration of ancient correspondence (Demosthenes, *Orations*, xii). The letter interpolated in the *Oration on the Crown* (id., *De Corona*, 77-78), while a forgery, is nevertheless a satisfactory example, so far as touches form, of ancient epistolography. This, which begins with "Philip, King of Macedon, to the Senate and People of Athens," conforms a little more to polite usage by ending with the usual and conventional "farewell."

Somewhat later than the letters of Philip comes an amiable little note written by the distinguished philosopher Epicurus to a little girl, in which the affectionate diminutives "papa" and "mamma" appear.

But by far the most illuminating light thrown on ancient letter writing comes from the discoveries made in the Fayum district of the Nile valley. Within a few years the Egyptian

Exploration Fund, acting through Grenfell and Hunt, and others, have recovered numerous papyri, buried with the dead, which exhibit letters written in the time extending roughly from the second century B.C. to the fourth century of our era. Some of the letters date even later. These documents are of inestimable value to the student of Greek epistolography, for they were written with no thought of ultimate publication or of posterity and deal with matters of the most diverse character. A perusal of their contents results in a startling realization of the similarity of interests of people of all times. It is, in fact, most easy to imagine one's self in the surroundings unconsciously depicted in these letters. Thus, one finds a formal invitation to a wedding couched in the words "Eras invites you to a wedding to-morrow, the twenty-ninth, at the ninth hour"; or an equally formal invitation, "Heratheon invites you to dine with him, on the occasion of his examination, at his house to-morrow the fifth at the ninth hour"; or again the invitation of a cavalry officer running, "The decurion invites you to his party on the sixth day before the calends at eight o'clock."

Many of the letters, as one might expect, deal with ordinary domestic affairs. A slave, Aphrodite, writes her mistress about her work, Aphion tells Didymus of his sister's illness, or Nicanor writes about some clothing which has been lost. Once in a while the letters are most unusual in character. A woman, Helene by name, sends a most ungrammatical epistle to her brother reproaching him for not attending the funeral of another brother, ending in a casual fashion with a request that he execute certain commissions and that he send their father a fish. Some one else writes about the purchase of yokes and manure, while Troilus, rich but illiterate, tells his sister to "have my tunic properly made and let them put good measure on it and be generous in coloring." Equally characteristic is a letter in which Herochides is asked to match a white-violet color and to purchase two drachmas' worth. The request is accompanied by a gift of six quarts of "good apples."

Nothing could be more modern than the anxious letter of a mother writing to her boy deploring the leaving of his tutor and urging him to be studious and to get another good one; and refreshing in its up-to-dateness is the indignation of a man who writes to his son that "Aunes, the donkey driver, has bought a rotten bundle of hay at 12 drachmas, a little bundle and rotten hay, the whole of it decayed and no better than dung." And yet all letters are not trivial and amusing. Grief touched these people, and consoling friends sent letters which in distinctly modern spirit ended with "There is nothing to do in the face of such trouble."

So it is that the whole gamut of human interests is run. Some one urges another for a position or sends a begging letter, a pompous individual writes grandiloquently to his wife, while another man writes about a mouse catcher who is engaged to free his house from the pest. Sometimes one finds an official sending instructions to the effect that some woman is to be arrested for dealing in contraband oil, another authorizing the embarkation of corn on a government transport, or giving instructions that a body of striking quarry slaves be apprehended as soon as possible.

Humor is present in those letters. Sometimes it is consciously afforded, as in a letter from Sarapion to his brother Dorion, in which, after certain serious matters are discussed, Dorion is asked to let his brother "hear about our bald-headed friend, how his hair is growing again." Sometimes the humor is unconsciously afforded, as in a letter from Sereness to his wife who has deserted him. His desolation at once appears with the words "I assure you that ever since you left me I have been in mourning, weeping by night and lamenting by day. Since we bathed together on Phaophi first I never bathed nor anointed myself until Athur twelfth."

In more serious mood one finds Lucius writing to his brother Apollinarius warning him to look out for "white-slavers" who have designs upon the daughter of a deceased friend of theirs. Even as now, debts were hard to collect in those old days, so that Sarapammon was forced to write to Piperas, "Let me tell you that you owe me seven years' rents and dues; so, unless you now send discharges, you know the danger." But if such a letter as this shows that human nature is a constant at all times, it can be shown even better by a letter written by a disappointed little boy to his father. It runs: "It was a fine thing of you not to take me with you to the city. If you won't take me to Alexandria I won't write you a letter, or speak to you, or say good-by to you; and if you go to Alexandria I won't take your hand or ever greet you again. That is what will happen if you don't take me. Mother said to Archelaus, 'It quite upsets him to be left behind.' It was good of you to send me presents on the twelfth, the day you sailed. Send me a lyre, please! If you don't I won't eat, I won't drink; so there!"

In these letters the formal manner of salutation was "Ptolemaus to Heraclides, greeting," and the letter was terminated by the word "good-by," followed by the date. But, as can easily be imagined, the salutation varied according to the intimacy and affection of the persons concerned. In place of simple "greeting" often occurs "many greetings," while a fond father might open a letter to his son with "Cornelius to his sweetest son, Hierax, greeting." Sometimes the salutation becomes most ambitious, as in the following: "Ptolemaus to Heraclides, greeting. If you are well, and if the objects of your care and other concerns are to your mind, I should be glad, and much gratitude would be due to the gods. I myself also am in good health." Such a salutation, it must be said, is unusual.

The outside of the letter carries the address, as a rule in the form "To Tyrannus" or "To Faustus . . . at Nekle." This was sometimes expanded to read "Deliver to my brother Dorion" or "Deliver from Dionysius to his sister Didyme."

PARÁ, pá-rá'. An estuary indenting the northeast coast of Brazil and forming the south boundary of Marajo Island (q.v.), of which the true mouth of the Amazon is the north boundary (Map: Brazil, H 4). The Rio Pará is 40 miles wide at its mouth and has, in general, a width of 5 to 10 miles for a distance of 200 miles inland. Formerly it was probably one of the principal mouths of the Amazon, but is now connected with that river only by a network of channels and backwaters, which however form the principal steamship routes to the Amazon, since the true mouth is obstructed by islands and strong currents. The Pará has become the almost independent estuary of the Tocantins (q.v.).

PARÁ. One of the largest and commercially most important states of Brazil, occupying the northeastern part of the Republic, and bounded by the Guianas on the north, the Atlantic Ocean on the northeast, the Brazilian states of Maranhão and Goyaz on the east, Matto Grosso on the south, and Amazonas on the west (Map: Brazil, H 4). Its area is 482,600 square miles. The surface consists of plateaus rising from the here narrow Amazonian valley to a height of 2500 feet in the north and south. The Amazon River with its extensive estuary takes in a large portion of the state, and the adjoining lowlands are inundated during the rainy season. Its two large tributaries, the Tapajos and the Xingú, and the system of the Tocantins, give the state a network of navigable waterways and thus remove one of the greatest obstacles in the way of industrial development in South American countries—lack of transportation facilities. The climate is hot and moist, but being tempered by the trade winds is not unhealthful. Most of the lowlands are covered with dense forests, which yield the most important product as well as the chief source of revenue of Pará—rubber. Cabinet woods and medicinal plants also abound. Agriculture is little developed on account of the scarcity of population, but some cotton, tobacco, and cereals are raised. The principal exports are rubber (10,311,323 kilos in 1911), cacao, Brazil nuts, and hides. Most of the exports go to New York and Liverpool. The mineral deposits of Pará, including petroleum, iron, copper, and lead, are believed to be extensive, but so far very little has been done towards their exploitation. Pará has two short railways—one from the capital to the coast and one around the rapids of the Tocantins. The population of Pará was 445,356 in 1900 and 660,000 (est.) in 1913. The Indians are mostly civilized. The capital is Pará (q.v.).

PARÁ, or BELÉM. The capital of the State of Pará, Brazil, situated on the southeast shore of the Pará estuary (q.v.), 85 miles from the ocean and 1° 27' south of the equator (Map: Brazil, H 4). Viewed from the harbor, it presents a picturesque appearance with its numerous churches and white houses half hidden amid luxuriant tropical foliage. The streets are in general narrow and ill-paved, but some of

them are wide and straight, and there are several spacious avenues lined with trees. The principal building is the cathedral, dating from 1720. There are a lyceum and other schools, a public library, a museum, a large botanical garden, and many scientific, literary, and charitable institutions. The government buildings are plain structures. The harbor has 30 feet of water, and being situated at the principal entrance for ships into the Amazon and in the northern part of the country, where it is comparatively near to the commercial countries of Europe, Pará has become an important trade centre. Its chief exports are rubber, cacao, and Brazil nuts. It is one of the leading ports of the world in rubber export and controls about one-half that of Brazil. In 1912 it amounted to 20,366,414 kilos, valued at about \$35,583,000. The total exports for 1912 were 116,112,152 milreis (32.4 cents) and the imports 47,377,541 milreis. The population has increased rapidly during the last 50 years and was estimated at 170,000 in 1913. Pará is the seat of a United States consul.

Pará was founded in 1616, but was unimportant until the middle of the nineteenth century. During the disastrous racial and social strifes of 1835-48 the population fell from 25,000 to 15,000, and it was still further reduced by the epidemic of yellow fever in 1850. Since that year, however, it has grown rapidly.

PARA (Pers. *pāra*, piece, portion). A coin of copper, silver, or mixed metal, though generally of copper, in use in Turkey, Egypt, Cyprus, Montenegro, and Serbia; it is the fortieth part of a piastre (\$0.044 in Turkey and \$0.04943 in Egypt in 1914), is divided into three aspers, and varies much in value, owing to the debased and complicated condition of the Turkish coinage. Pieces of five paras are also in use. The para is equal to about one mill (American) in Turkey and a little more in Egypt. In Montenegro it is $\frac{1}{100}$ of a perper, or equivalent to \$0.002026 United States money, and in Serbia it is $\frac{1}{1000}$ of a denar, or \$0.00193.

PARA-ACETPHENETIDINE. See PHENACETIN.

PARABANIC (pär'a-bän'ík) **ACID**, or OXALYL UREA, $C_2H_2N_2O_3$. A chemical compound of carbon, hydrogen, nitrogen, and oxygen, prepared by the action of various oxidizing agents upon uric acid or upon guanine. It was first obtained by Liebig and Wöhler in 1838. It acts as a dibasic acid, the two hydrogen atoms of its molecule being replaceable by metals; thus, its acid and neutral silver salts have respectively the formulæ $C_2HN_2O_3Ag$ and $C_2N_2O_3Ag_2$. Parabanic acid is moderately soluble in water. It melts at 100° C. (212° F.). Its chemical constitution is represented by the formula

PAR'ABLE (OF. *parable*, *parabole*, Fr. *parabole*, from Lat. *parabola*, *parabole*, from Gk. *παράβολη*, a juxtaposition of things, a comparison, a similitude, from *παράβαλλειν*, *paraballein*, to throw beside, to compare, from *παρά*, *para*, beside + *βάλλειν*, *ballein*, to throw). A term originally used by Greek rhetoricians for any distinctly introduced literary illustration. The later Greek writers used it more specifically for a short fictitious narrative, founded upon any real event in nature or human experience, in-

tended to convey a moral or religious meaning. It thus differs from the apologue (q.v.) in being inherently probable in itself, and from the allegory (q.v.) in being less artificial. The parable is best known from its use in the Bible, the revisers, however, using the word much more comprehensively than the technical sense would justify. In the Old Testament it is not, in its strictly defined meaning, of common occurrence. The five examples which admit of the least question are: (1) the prophet Nathan's parable of the poor man with the one ewe lamb, told to King David (2 Sam. xii. 1-4); (2) the story of the woman of Tekoa concerning her sons (2 Sam. xiv. 5-7); (3) the tale of the prophet regarding the escaped captive, told to King Ahab (1 Kings xx. 39-40); (4) Jehovah's rebuking song of the vineyard (Isa. v. 1-6); and (5) the parable of planting and threshing (Isa. xxviii. 24-28). Ancient Jewish writings outside the Bible, however, abound in parables. In the New Testament the word *παράβολή* occurs 48 times in the Synoptic Gospels, but nowhere else except twice in the Epistle to the Hebrews (ix. 9; xi. 19, rendered "parable" in the English revision, but "figure" in the Authorized Version and in the American revision). It designates either a short narrative designed to convey spiritual truth, such as the parable of the sower (Matt. xiii. 8 et seq.), or, more rarely, a popular proverb, such as "Physician, heal thyself" (Luke iv. 23). Hence many of the utterances of Jesus, which are commonly regarded as proverbs ("consider the lilies," "salt of the earth," "light under a bushel"), might be classified as parables.

PARABOLA (Neo-Lat., from Gk. *παράβολή*, *parabolē*, comparison, juxtaposition, parable, parabola). A conic section cut by a plane parallel to the element of the cone. When the plane coincides with its parallel element, the parabola assumes the limiting form of a straight line. The parabola may also be defined as the locus of a point whose distance from a fixed point (the focus) is equal to its distance from a fixed straight line (the directrix), i.e., its eccentricity (q.v.) is 1. From this definition its construction readily follows. Let DD' (Fig. 1) be the fixed straight line or directrix, and F the fixed point or focus. Draw a perpendicular to the directrix, passing through the focus, and this will be the axis of the curve. The point O on the axis, halfway between F and DD' , will evidently, from the second of the above definitions, be a point on the curve. To find other points on the curve draw a series of lines par-

allel to the directrix and cutting the axis XA' in M_1, M_2, F, M_3, \dots . With F as a centre and ZM_1 as a radius, describe an arc cutting the perpendicular through M_1 in P_1 and Q_1 ; with F as a centre and ZM_2 as a radius, describe a circle cutting

FIG. 1.

the perpendicular through M_2 in P_2 and Q_2 ; and so on. The points $P_1, P_2, \dots, Q_1, Q_2, \dots$ are then points on a parabola. PQ is called the latus rectum or parameter, and, as is evident from the construction, equals twice the distance between the focus and directrix. The curve may be described mechanically in the following manner: Move a right-angled triangle with one perpendicular side coinciding with the directrix; a string equal in length to the other perpendicular side has one end fastened to the outer vertex of the triangle and the other to the focus; a pencil resting against the lower side of the triangle and holding the string taut will trace a parabola.

The Cartesian equation of the parabola, its axis being taken as the X -axis and its vertex as the origin, is $y^2 = 2px$, where $\frac{1}{2}p$ is the distance between the focus and the vertex. Its polar equation, the focus being the pole, is

$$r = \frac{p}{1 - \cos \theta}; \text{ or } r = \frac{2p \cos \theta}{\sin^2 \theta}$$

when the vertex is taken as the pole. The following are some of the most important properties of the parabola: (1) Any line RH (Fig. 2) parallel to the X -axis is a diameter, i.e., it bisects a system of parallel chords, as

FIG. 2.

those parallel to PQ ; (2) the subnormal MN is constant and equal to the semilatus rectum FK ; (3) if the tangent through P cuts the X -axis in T , and if the normal at P cuts the X -axis in N , the focus F is equidistant from P , T , and N ; (4) the angle $DPT = \text{angle } XTP$ is equal to the angle TPF , or the tangent at any point makes equal angles with the axis of the curve and the

focal radius to the point of contact (these last two properties furnishing simple methods for drawing tangents to the parabola); (5) through any point in the plane three normals can be drawn to the parabola; (6) the tangents at the extremities of any focal chord PL intersect at a point G on the directrix and at right angles; (7) a perpendicular from the focus F upon a tangent SQ meets this tangent at a point I on the tangent through the vertex; (8) a tangent RE at the end of a diameter RH is parallel to the chords bisected by that diameter, of which PQ is one, and the tangents at the extremities of PQ intersect upon the corresponding diameter SH ; (9) the area of a parabolic segment $ORPQ$ is $\frac{1}{6}$ of the triangle RPQ on the same base and having the same height; (10) the parabola has no real finite asymptotes.

Concave reflecting mirrors are often formed so that all axial sections are equal parabolas. In such a mirror all parallel rays of light are reflected to the focus; and, conversely, if a light is placed at the focus of such a mirror, its rays are reflected in a parallel pencil. If a body were projected upward and obliquely to the direction of gravity, it would, if undisturbed by any other force except gravity, accurately describe a parabola whose axis is vertical and whose vertex is the highest point reached by the body. The term "parabola" is used in analysis, more generally, to denote that class of curves in which some power of the ordinate is proportional to a lower power of the corresponding abscissa. Thus, the common parabola above given has the equation $y^2 = kx$, the cubical parabola has the equation $y = a + bx + cx^2 + dx^3$, the simplest form being $y = kx^3$, and the semicubical parabola, $y = kx^{\frac{3}{2}}$ or $y^2 = kx^3$. The last-mentioned curve is also known as the Neilean parabola, because it was rectified by William Neil (1657).

For the various curves bearing the name "parabola," consult H. Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897; partie complémentaire, 1899). For the general topic, consult any work on analytic geometry.

PARABOLANI (Lat. nom. pl., from Gk. *παράβολος*, *parabolos*, reckless, from *παράβαλλειν*, *paraballein*, to throw beside, to compare). A class of functionaries in the early Church, by some writers reckoned as members of the clergy and included in the minor orders, but more probably religious associations, whose chief duty was to tend the sick, whether in ordinary diseases or in times of pestilence. They received their name from the boldness with which they exposed themselves to danger of contagion. By some the association is believed to have originated at Alexandria in the time of a great pestilence under the Bishop Dionysius in the third century. They were certainly very numerous at Alexandria, amounting to some 500 or 600, but were also enrolled in other churches. We find them at Ephesus, at the time of the council in 449, and at Constantinople under Justinian, who limited their numbers in that city to 950. The Code of Theodosius the Younger (416) limited them in Alexandria to 500 and made them subject to the *Præfectus Augustalis*, but a later decree placed them directly under the authority of the Bishop. They seem to have been mainly from the lower classes and with a tendency to disorder. After the time of Justinian they are not mentioned.

PARABOLOID (from Gk. *παράβολή*, *parabolē*, parabola + *εἶδος*, *eidos*, form). A solid whose surface is generated by a parabola which moves with its vertex always on another parabola, the axes of the two curves being parallel and their planes perpendicular to each other. It has the equation $Ax^2 + By^2 - 2Cz = 0$, or $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2cz$. (See COORDINATES.) If B is positive, the surface is called an *elliptic* paraboloid; if B is negative, a *hyperbolic* paraboloid. The sections of the former made by the coordinate planes, $x = 0$, $y = 0$, are parabolas having a common axis. The section by any plane parallel to $z = 0$ on the positive side is a real ellipse; on the negative side the section is imaginary. The sections of the hyperbolic paraboloid made by the planes $x = 0$, $y = 0$ are parabolas, but the sections made by planes parallel to $z = 0$ are hyperbolas. The section made by the plane $z = 0$ is two intersecting straight lines, the limiting form of the other hyperbolas. The hyperbolic paraboloid is a special case of the hyperboloid of one sheet and hence is a ruled surface. A paraboloid of revolution is formed by revolving a parabola about its principal axis. Its equation is $x^2 + y^2 = 4pz$. Sections of such a figure perpendicular to

HYPERBOLIC PARABOLOID.

the axis of revolution are circles. The term *paraboloidal* is applied to bodies having the general form of a paraboloid, a form commonly found in concave reflecting mirrors. See PARABOLA.

PARACATÚ, pá'rá-ká-tōŭ'. A town of the State of Minas Geraes, Brazil, near the border of the State of Goyaz, situated 450 miles northwest of Rio de Janeiro (Map: Brazil, H 7). The town was founded near the middle of the eighteenth century and was formerly famous for its rich gold washings. Now its chief industries are stock raising and the cultivation of sugar cane and coffee. Pop., about 10,000.

PARACEL'SUS. The assumed name of Philippus Aureolus Paracelsus Theophrastus Bombastus von Hohenheim (1493-1541). A German physician and chemist. He was born at Einsiedeln, Switzerland, the son of a physician and chemist, Wilhelm Bombast von Hohenheim; he received his early education from his father, and at 16 he went to Basel University, but soon abandoned it for the study of chemistry and alchemy under Withemina, Bishop of Würzburg. He traveled widely, sustaining himself by irregular practice and collecting a vast amount of miscellaneous medical knowledge, especially of folk medicine, through associating with barbers, gypsies, and executioners. He served some time as a military surgeon in the Low Countries, Denmark, and Italy, and learned practical metallurgy at the mines in Tirol belonging to the Fugger family, who were cele-

brated for their patronage of art and science. Here he appears to have studied diligently, investigating the processes of preparing metals and making experiments as to their medicinal virtues. His cures, real or pretended, became voiced abroad, and he was called to prescribe for many of the great men of his day. Erasmus was one of his patients. At the recommendation of Oecolampadius he was, in 1526, appointed professor of physic and surgery at Basel, when he inaugurated his career as a teacher by publicly burning the works of Galen and denouncing the Arabian masters, whose teachings were then generally followed. He also flouted tradition by lecturing in German instead of Latin. His defiance of tradition, in addition to his arrogance, vanity, and drunkenness, provoked the most bitter animosity of the regular faculty, and he was compelled to leave the university in 1528. He resumed his wanderings. Wherever he went he excited the regular faculty to a state of violent hatred, not wholly undeserved. At Salzburg he gave offense and was thrown from a window by the servants of a physician, dying from the fall. His grave is in St. Sebastian's Church in Salzburg.

In spite of his turbulent life and charlatan methods, Paracelsus exerted a profound influence upon the medical beliefs of his time and of succeeding centuries. He struck at the weak points of the prevailing system of medicine; he destroyed the "humoral pathology" (which was founded on the belief that diseases depended upon an excess or deficiency of bile, phlegm, or blood), and taught that diseases were actual entities and were to be combated with specific remedies. He improved pharmacy and therapeutics, introduced new remedies (opium, mercury, sulphur, iron, arsenic, etc.), made some new chemical compounds, and strove to reduce the overdosing then practiced. A large number of medical works are attributed to him, many of which were written by his followers, and some, it is declared, by his enemies in order to injure his reputation. Marx admits only 10 as genuine, and Häser 24. His best-known work is *Die grosse Windartzney* (1530). Collected editions of his writings appeared at Basel, Strassburg, Geneva, and Munich. The first English translation was edited by John Hester and appeared in London in 1596 under the title *One Hundred and Fourteenc Experiments and Cures, etc*.

Jahrhundert* (Leipzig, 1893-94); id., *Versuch einer Kritik der Echtheit der paracelsischen Schriften* (Berlin, 1894-99); *The Hermetic and Alchemical Writings of Aureolus Philippus Theophrastus Bombast*, edited by A. E. Waite (2 vols., London, 1894); Hartmann, *Grundriss der Lehren des Theophrastus Paracelsus* (Leipzig, 1898); Franz Hartmann, *Life and Doctrines of Philippus Theophrastus Bombast of Hohenheim* (new ed., New York, 1910); Agnes Bartscherer, *Paracelsus, Paracelsisten und Goethes Faust* (Dortmund, 1911), containing a bibliography. Consult also Robert Brownings' long poem "Paracelsus."

PAR'ACENTE/SIS. (from Gk. *παράκέντησις*, *parakéntesis*, tapping, from *παρά*, *para*, from, beside + *κέντειν*, *kentein*, to prick or to stab). A surgical operation consisting in tapping or

puncturing, with a hollow needle, a cavity of the body, for the evacuation of pus, serum, or other fluids. Paracentesis of the thorax is performed in cases of pleurisy with effusion, of the abdomen in ascites (q.v.), of the pericardium in pericarditis, etc. Paracentesis of the eardrum is at the present time a misnomer; the operation usually performed for the evacuation of pus or serum in the tympanum consists of a free incision with a small knife.

PARACHUTE, pār'a-shōōt' (Fr. *parachute*, from ML. *parare*, to guard against, prevent, Lat. *parare*, to prepare + Fr. *chute*, fall, OF. *cheute*, *cheoite*, It. *caduta*, fall, from Lat. *cadere*, to fall). A device for the purpose of diminishing the velocity of a falling body and used by aeronauts as a means of descending from balloons. The parachute may be likened to a large umbrella. Its invention is accredited to Sebastian Lenormand, and the device was used by him in 1784 in making a descent from an upper window of a house in Lyons. The first descent from a balloon was made by Garnerin in Paris in 1797, in which a parachute, 23 feet in diameter, composed of a number of gores of canvas, was employed. In its usual form the parachute is made of canvas, being attached to the balloon so as to hang loose during the ascent and to spread out and offer a resisting surface as soon as it is separated from the balloon and begins to fall. For a weight of 220 pounds, which includes that of the passenger as well as of the apparatus, it is necessary to have a surface about 40 feet in diameter in order to reduce the velocity to a rate of about 3¼ feet per second. The car or basket is supported by cords attached to the edge of the canvas, and sometimes there is a heavier cord or girth which passes over the top of the parachute and carries the larger part of the weight. There is generally a small opening at the top to allow some of the air to pass out, and this serves to keep the parachute steady in its proper position and prevent swinging.

PAR'ACYAN'OGEN. See CYANOGEN.

PARADE' (Fr. *parade*, show, halt on horseback, from Sp., Portug. *parada*, halt, parade, from *parar*, to halt, prepare, from Lat. *parare*, to prepare; connected with *ἐπὶ*, *eporōn*, I prepared). In its original sense, a prepared ground, but applied also to the courtyard of a castle or fortification and afterward to any inclosed and level stretch of ground. In every barracks, fort, or army post there is a parade ground upon which the regiment assembles and is formed for inspection or ceremony.

A parade is also one of the formal ceremonies prescribed by army and drill regulations for infantry and cavalry. For field artillery parade is not authorized. In the United States army infantry parade is conducted as follows: *General Rules*.—If dismounted, the officer viewing the parade, and his staff, stand at parade rest, with arms folded, while the band is sounding off; they resume attention with the adjutant. If mounted, they remain at attention. At the command "Report," given by a battalion adjutant, the captains in succession from the right salute and report: "A (or other) Company, present or accounted for"; or "A (or other) Company, (so many) officers or enlisted men absent," and resume the "order sabre." At the same command given by the regimental adjutant, the majors similarly report their battalions.

Battalion Parade.—At adjutant's call the battalion is formed in line but not presented. Lieutenants take their posts in front of the centre of their respective platoons at the captain's command for dressing his company on the line. The major takes post at a convenient distance in front of the centre and facing the battalion. The adjutant then commands "Guides, posts"; "Parade, rest"; and "Sound off." At the latter command the band, playing in quick time, passes in front of the line of officers to the left of the line and back. "Retreat" is then sounded by the field music, and, following the last note and while the flag is being lowered, the band plays the "Star-Spangled Banner," the battalion being at "attention." The battalion is then presented to the major, who puts it through such exercises in the manual of arms as he desires. The major then directs the adjutant to receive the reports and publish the orders. All the company officers then form in line, march to within six paces of the major, salute, and receive such instructions as he may give. They then return to their companies, after which the command passes in review. When the last company has passed the ceremony is concluded. Regimental parade is conducted on the same general principles. Cavalry parade is similarly conducted under its own regulations. Consult *Infantry Drill Regulations, United States Army, 1911, amended to 1915* (Washington, 1915).

Parade is also used as a term in fencing, particularly by those of the French school. It is a guard position, designed to meet or parry thrusts, the English equivalent for which is *parry*.

PARADISE (OF., Fr. *paradis*, from Lat. *paradisus*, from Gk. *παράδεισος*, *paradeisos*, park, Paradise, from Avestan, *pairi-daēza*, inclosure). A word found in the Old Testament and in Greek writers from Xenophon on, as a term for the great hunting and pleasure parks of the Persian kings. It is the word translated "forest" in Neh. ii. 8, and that rendered by "orchard" in the Song of Songs iv. 13 and Eccles. ii. 5; this original sense of "park" appears in English literature. The word was adopted by the Greek translators of the Old Testament for the "garden" in Eden (Gen. i. 8, and in other biblical references to Eden, q.v.). The later religious notion is bound up with the Jewish mystical thought concerning the Garden of Eden. This was supposed to be still in existence in some remote and mysteriously inaccessible place (Gen. iii. 24), to which the apocalyptic thought of Judaism, from the second century B.C., added the notion that it was reserved as the future abode of the righteous. This thought is first fully developed by the Book of Enoch (q.v.), which locates Paradise variously—in the west (like the classic Isles of the Blest), in the north (with the Mount of God), or in the east (as in Genesis). According to this first stage of thought Paradise is a place of sensual delight. It was also the abode of the two saints who had been translated from this world, Enoch and Elijah. But the rapid development of eschatology grew impatient of waiting for the Day of Judgment for the decision of the fate of the dead, and in the first century B.C. Paradise became the intermediate abode of all the righteous. Yet a further step took place in the spiritualization of the idea. Just as Jerusalem was supposed to be mystically preserved in the heavens until the

day of redemption (cf. Rev. xxi-xxii), so was Paradise caught up into the celestial spheres, and thither the spirits of the faithful were conveyed upon death. This view appears at length in the Book of the Secrets of Enoch (see ENOCH, BOOKS OF), which locates Paradise in the third of the seven heavens, and is represented in the New Testament by Luke xxiii. 43 (cf. xvi. 23 et seq.) and 2 Cor. xii. 2. At the same time there was uncertainty whether this was the final abode of the saints, Jewish theology requiring the Day of Judgment. In Rev. ii. 7 Paradise seems to be synonymous with heaven. Even in these spiritualized conceptions the imagery of the ancient Garden of Eden appears still in the Tree of Life and the Water of Life. The New Testament does not add to the idea of Paradise, but the Christian doctrine of the return of Christ to consummate his kingdom developed the notion of Paradise as the place of departed saints, where they are supposed to "sleep in Jesus" and at the same time to enjoy mystic fellowship with him and with the saints on earth. In mediæval theology these distinctions are exactly drawn, whereas in most Protestant theology the doctrine of Paradise remains indistinct, and in popular Protestantism Paradise is equivalent to heaven. In Islam the notion of Paradise was taken over and still further sensualized; it remains a garden full of all carnal delights. (See MOHAMMEDANISM.) It is interesting to note that this idea of a garden has always appealed to the Semitic mind, which, accustomed to the desert, takes the well-watered garden as the type of heaven; but Occidental thought has stripped the theological idea of this picturesque connotation. See ESCHATOLOGY; HEAVEN.

PARADISE LOST. An epic poem by John Milton, published in 1667. The idea of a great epic had filled Milton's mind for many years; at first the legend of King Arthur attracted him, but he chose at last the story of the fall of man, attempted in English by Cædmon and Fletcher. Milton may have been influenced by Andreini's drama *Adamo*, about 1640, and Joost van Vondel's drama *Lucifer*, 1654.

PARADISE OF FOOLS, THE. One of the four divisions of Limbo, the *Limbus Patuorum*, reserved for fools, idiots, and lunatics; but at present the term denotes the state of mind of one who frequently indulges in vain hopes and expectations.

PARADISE REGAINED. A poem by John Milton (1671). It supplements the *Paradise Lost*, but is written in a colder, more severe style. It is, in fact, a paraphrase of the narrative of the Temptation in the Gospels, a dra-

matic dialogue between two voices, good and evil.

PARADISO, pǎ'rǎ-dě'zô, IL (It., The Paradise). The last part of Dante's *Divine Comedy*.
PARADOL, LUCIEN ANATOLE PRÉVOST. See PRÉVOST-PARADOL, L. A

PARADOXIDES, pǎr'ǎ-dôx'f-děz (Neo-Lat nom. pl., from Gk *παράδοξος*, *paradoxos*, incredible, from *παρά*, *para*, beside, beyond + *δόξα*, *doxa*, opinion, belief, from *δοkein*, *dokim*, to seem). An important and characteristic fossil trilobite of the Middle Cambrian rocks of North America, Europe, and Australia. The animal has a flat, long, tapering shield, with large arcuate head shield and 16 to 20 thoracic segments, and a small round tail shield or pygidium. The eyes are narrow, of crescentic outline, and not prominent, and the posterior lateral angles of the head are usually furnished with long spines. The best-known species, *Paradoxides harlani*, found in the sandy shales of the Cambrian in eastern Massachusetts, sometimes attains a length of 20 inches, with a width across the head of over 10 inches. Finely preserved specimens of other species of Paradoxides are found in the limestone nodules of the Cambrian shales of New Brunswick, Canada, and Newfoundland. See TRILOBITA

PARADOXURE. See PALM CIVET.

PARÆSTHESIA. See FORMICATION.

PARAFFIN (Fr *paraffine*, from Lat. *parum*, little + *affinis*, akin, from *ad*, to + *finis*, end). A hard, white, waxlike substance largely used for the manufacture of candles, a small amount of stearin being added to render the candles translucent. Paraffin is used, besides, in making matches, in preserving meat and wood, to improve the quality of timber employed as fuel, to render fabrics waterproof, etc. It occurs naturally in the mineral ozocerite, which was formerly the chief source of the substance. The manufacture of paraffin has developed into an important industry since 1851, when it was founded by James Young, a Scottish chemist. At present considerable quantities of paraffin are made in Germany by distilling certain varieties of brown coal. In Scotland, the chief seat of the industry, it is made from boghead coal and certain bituminous shales. When the shale is subjected to a process of destructive distillations, a green oily liquid passes over, which contains a large amount of paraffin in solution. This crude oil is washed with sulphuric acid and with caustic soda and is divided into more and less volatile fractions by further distillation. Most of the paraffin is contained in the heavy, nonvolatile fractions, and when the latter are let stand for some time at a sufficiently low temperature, the paraffin separates out in the form of a crystalline mass. The crude product is purified by washing with benzene and decolorized by heating with waste coal. At the present time paraffin is largely recovered from the residuum of petroleum (q.v.) distillation. Chemically paraffin is a mixture of the higher aliphatic hydrocarbons (see HYDROCARBONS), the relative composition of the mixture is not always the same, and the melting temperature varies with the product, being anywhere between 45° C and 90° C. Paraffin has neither taste nor odor, it is insoluble in and lighter than water.

Among the useful by-products obtained in the manufacture of paraffin are benzine (not benzene), asphalt, and paraffin oil. Paraffin oil yields oil gas, which has a very high illuminat-

ing power and is used to enrich ordinary coal gas; it is largely used also for lighting ships, railroad cars, etc.

PARAFFIN, NATIVE. See OZOCERITE.

PARAFFIN PAPER. See PAPER.

PARAFFINS. See HYDROCARBONS.

PARAGLOBULIN. See GLOBULINS.

PARAGOGE, pǎr'ǎ-gô'jê. See ETYMOLOGY. FIGURES OF

PARAGOULD, pǎr'ǎ-gôûld. A city and the county seat of Greene Co., Ark., 160 miles northeast of Little Rock, on the St. Louis Southwestern and the St. Louis, Iron Mountain, and Southern railroads (Map Arkansas, E 1). It contains a fine government building and a sanitarium. There are five large stove factories, a roller mill, pottery, hardwood mills, etc. Paragould is an important lumber shipping point. The water works are owned by the city. Pop., 1910, 5248.

PARAGUA, pǎr'ǎ-gwǎ. The old Spanish name of the island of Palawan, Philippines, and the present name of the province forming the north half of the island (Map Philippine Islands, B 6). Area, 1635 square miles. See PALAWAN.

PARAGUARI, pǎr'ǎ-gwa-rê'. A town of the department of the same name, Paraguay, 30 miles southeast of Asunción, on the railway leading from that place to Encarnación (Map: Paraguay, H 3). It is the centre of traffic for the surrounding region, which is chiefly engaged in tobacco culture. Paraguarí was founded in 1775. Pop. (est.), 10,000.

PARAGUAY, pǎr'ǎ-gwǎ or pǎr'ǎ-gwî'. An inland republic of South America, bounded on the north by Bolivia and Brazil, on the west and south by Argentina, and on the east by Argentina and Brazil. The tropic of Capricorn crosses the country, of which one-third is in the torrid and the remainder in the south temperate zone. It has an estimated area of 171,815 square miles. The Paraná River forms a large part of the east boundary. The country is divided by the Paraguay River into two sections: (1) east Paraguay (Paraguay proper), between the Paraguay and Paraná rivers, which has attained considerable development, (2) the part of the Gran Chaco belonging to the Republic, between the Paraguay and the Pilcomayo, which forms a portion of the west boundary. Few enterprises of the white race have yet been carried into the latter region.

Topography. East Paraguay is a plateau of no great elevation surmounted by low ridges and hills and subsiding in the west and southwest to grassy tracts, morasses, and lagoons, which scarcely rise above the fluvial level. The plateau has an average altitude of less than 300 feet above sea level, and the hills and ridges rarely exceed 1600 feet in height. The term "mountains" can hardly be assigned to these hills. Slightly undulating plains skirt the east bank of the Paraguay, but away from the river the hills soon become numerous and higher. Chains of low heights extend north and south through the country and are hyperbolically called sierras and cordilleras, though hunters and maté gatherers easily pass from one slope to the other. The fact that much of the interior is still little known is due not to these low ridges, but to the dense tangle of vegetation covering their slopes. The Gran Chaco west of the Paraguay River is mainly an immense level plain with a very slight slope towards the river.

and with large areas subject to frequent inundations.

Hydrography. Between the low ranges flow innumerable rivulets and streams. The whole country is divided into two fluvial basins, the Paraná system to the east and the Paraguay system to the west. While the Paraná is one of the largest rivers of the world and the Paraguay is its tributary, the former is of much less importance than the latter in the country's industrial development. Life, energy, and progress are chiefly centred in the valley of the Paraguay and especially on its east shore. Of great depth, unvarying in current and velocity, and containing an immense volume of water, it can at all times be navigated by the largest vessels, so that it forms a highway of trade into the heart of the continent. The Pilcomayo is the chief affluent of the Paraguay. It is navigable on the Bolivian frontier as well as in its lower reaches, but not in the middle course, where the current through the level plain is too feeble to excavate a deep channel.

Climate. The country has a subtropical climate, with the heat tempered by many refreshing breezes from the south. The average temperature is 70° F. That of the summer months (December, January, and February) ranges from about 55° F to 100° F. From May to August (winter) it occasionally falls to about 40° F., but during the day is frequently 86° F. Nine of the 12 months may be said to be perpetual spring, the other three months being very hot. The average annual rainfall at Asunción is 60.5 inches, while that of the whole country amounts to about 50 inches, distributed over about one-fourth of the days of the year. The rainy season is chiefly confined to the period between August and October, and, as the amount of precipitation shows, it cannot be compared with what is usually called the rainy season in tropical countries. The climate is healthful and produces no bad effects upon the European immigrant.

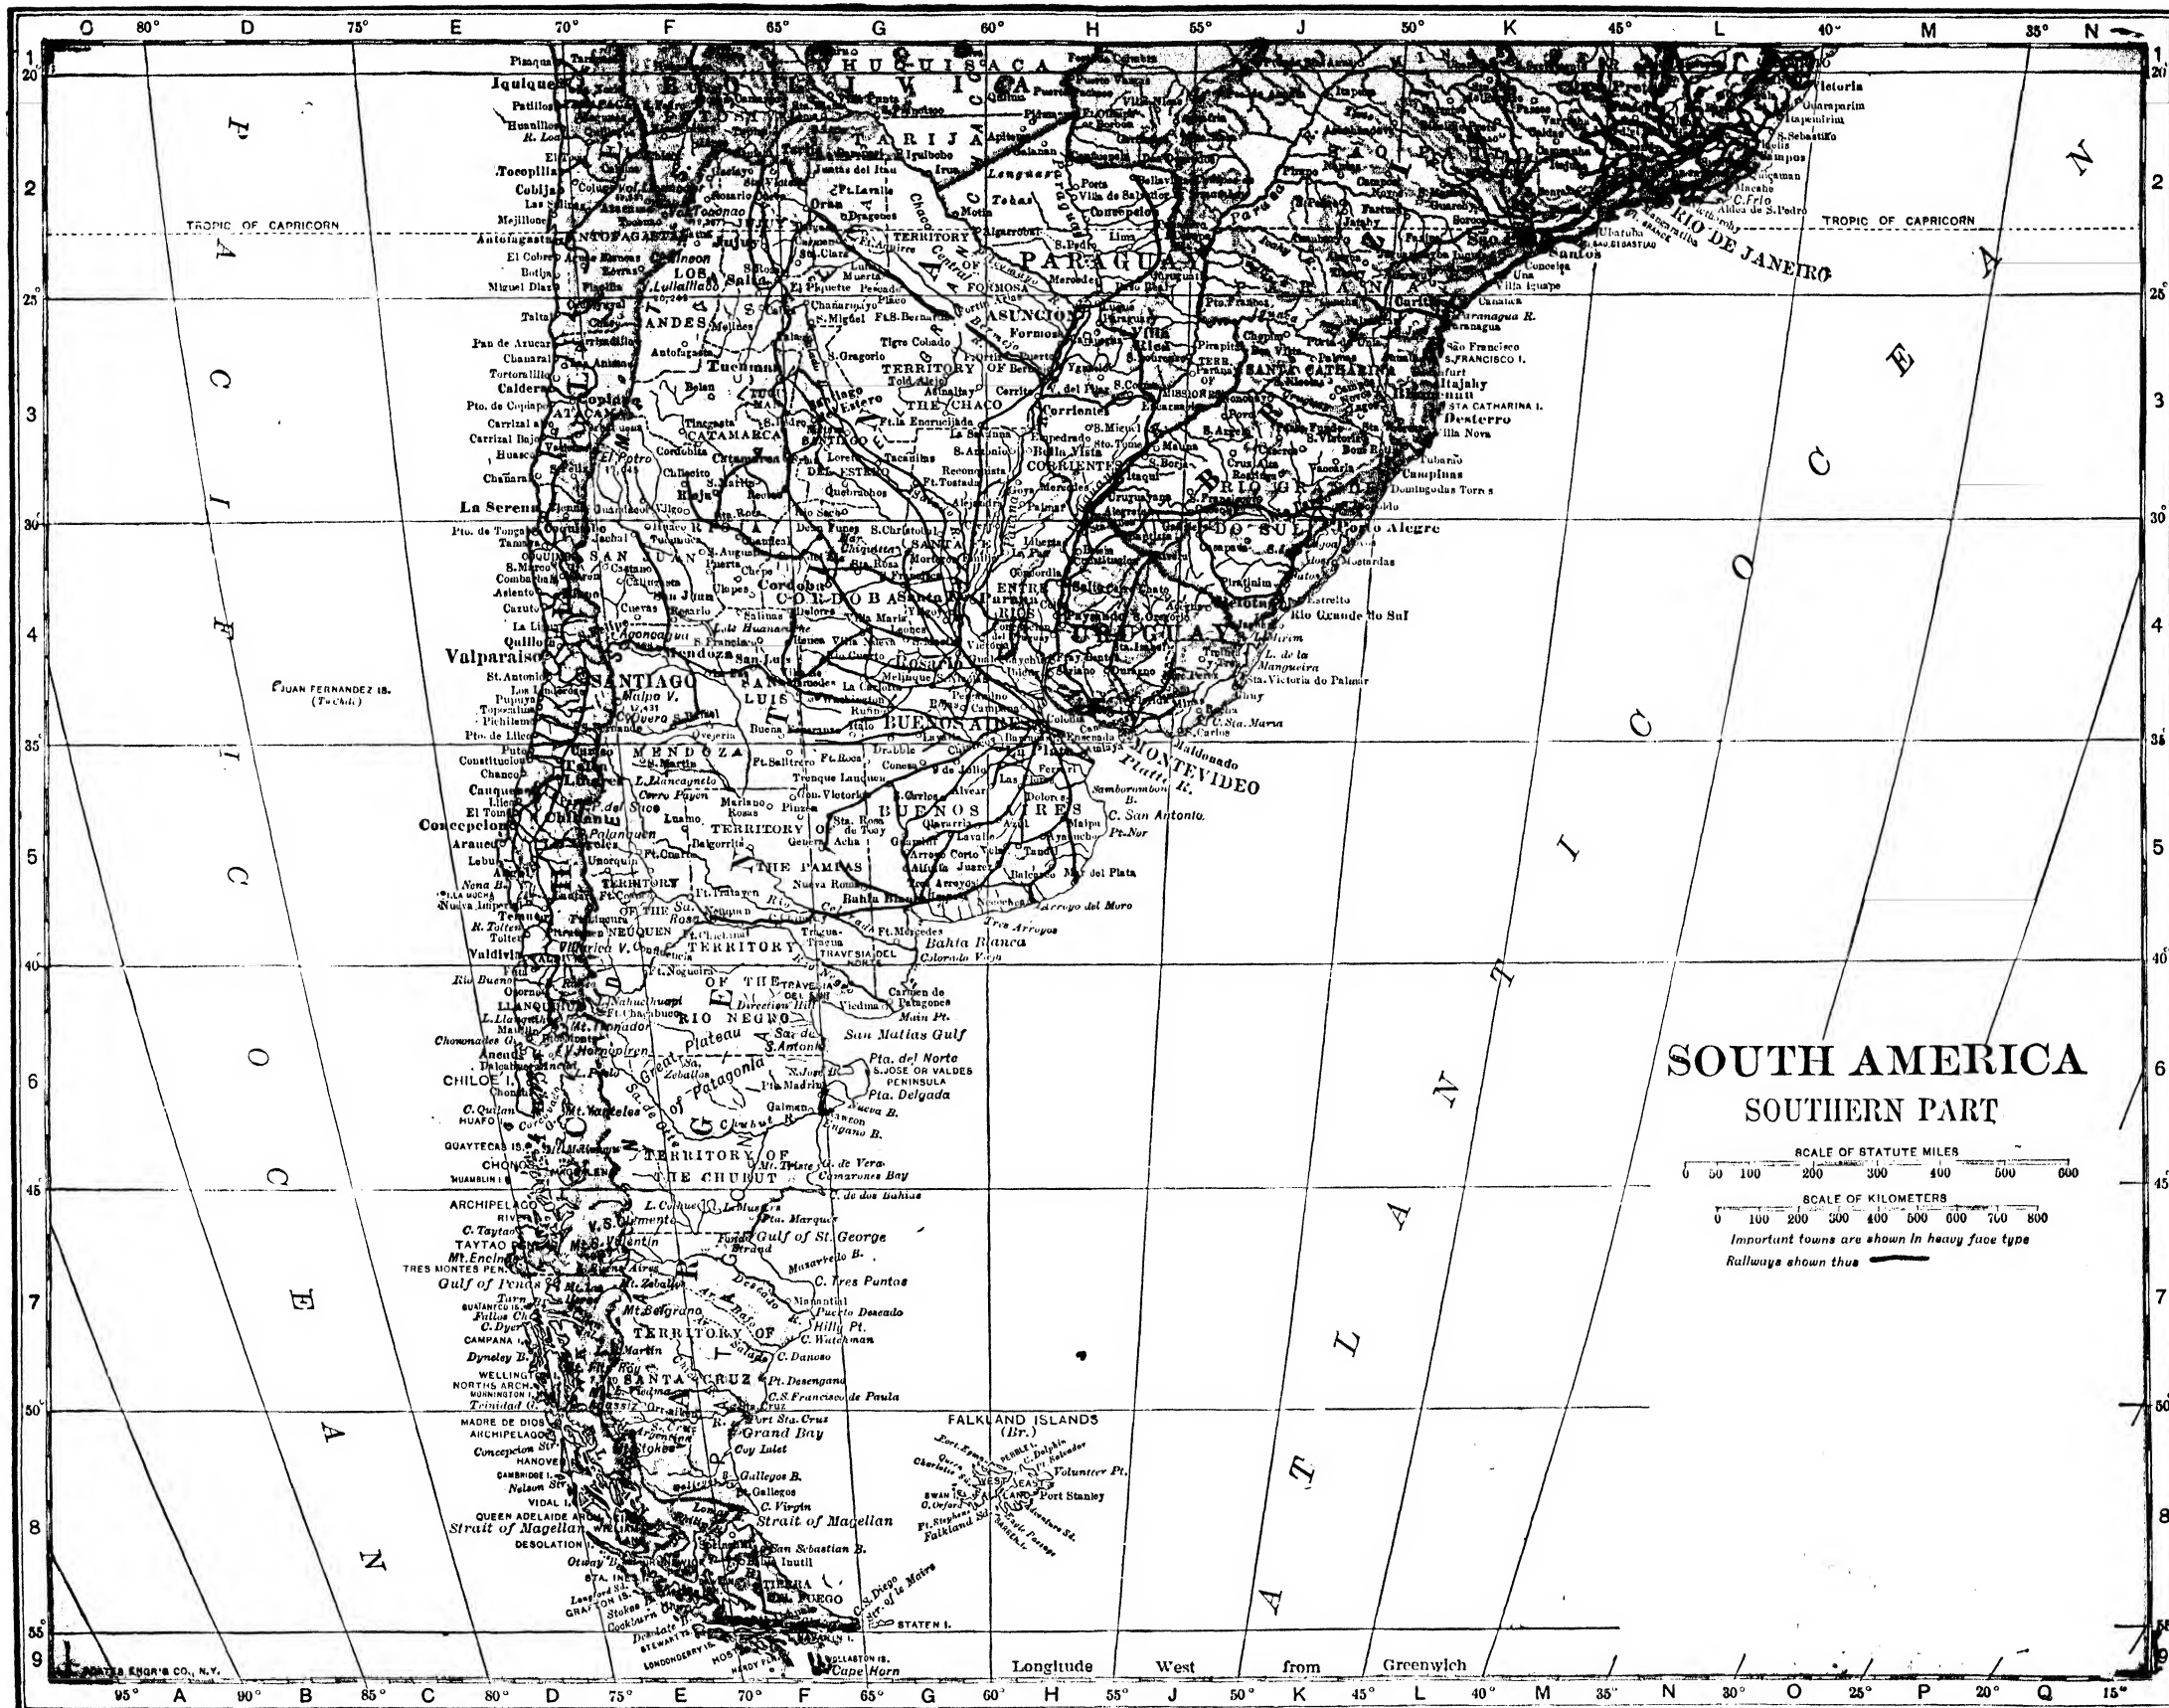

Flora. The Paraguay River divides the country into well-defined botanical regions. In east Paraguay the prevailing feature of hill and valley is virgin forests with majestic trees, tangled lianas, and brilliant flowers, among the forests are interspersed wide tracts of pasture covered with tall grass, and pindo and mbocaya palms crowning many hills. There are also groves of orange trees whose fruitage never fails, clumps of bananas, and the large bush of the timbo, a leguminous plant. The Chaco, west of the river, on the other hand, presents the bare aspect of a heath occasionally marshy or dotted over with yataí palms, on rising ground thrive dense quebracho forests. The excellence of Paraguayan timber, both for building and cabinet-making, is far-famed. The density of many of these woods is so great that they will not float; but lighter woods, such as are needed for ordinary carpenter work, are not lacking. The forests also supply dyestuffs and many medicinal plants. Perhaps the most characteristic vegetable product is yerba maté (see *Agriculture*, below).

Fauna. Among the wild animals are the jaguar, the most formidable of the carnivora, the American lion or puma, the tiger cat, the marten, polecat, tapir, peccary, and deer. Saurians swarm throughout the country. The alligator of the Paraná is strong and large, but not so fierce as that of the Amazon. Though the

venomous snakes include the rattlesnake, viper, and cobra, few cases of snake bite occur, largely because of the great caution of the Paraguayans. The boas are enormous, but singularly inoffensive. Paraguay can boast of some of the most beautiful birds in the world. No family is unrepresented, from the enormous wading birds to the tiniest of humming birds. In the wilderness flies, gnats, and other pests are very annoying, but, strange to say, they give little trouble in the cultivated districts.

Geology. Broadly speaking, limestones predominate in north Paraguay as far south as lat. 22° S, while sandstones prevail in most of the hilly regions of the south, the plains being formed of argillaceous beds and sandy stones belonging to the Tertiary epoch. In some districts volcano cones are seen. The hills and ridges are due to great dislocation of the rocks occurring long before the mighty upheaval of the Andean Cordilleras, but the present elevations are only the ruins of former lofty summits which have been degraded by long denudation. Little use is yet made of the mineral resources, though iron ore is widely distributed, marble is abundant in the north, and copper and other valuable minerals are found.

Agriculture, etc. The soil in Paraguay is generally good. Farming is the chief pursuit, but is in a very backward condition. Only about 300,000 acres are under cultivation, chiefly along the rivers, where transportation is easy. Owing to the fact that the state owns the public lands and for a long period sold large areas to capitalists and syndicates, the price of the lands most favorably situated for farming or stock raising was high, and this helped to retard the development of agriculture. Large tracts of country also have been assigned to the holders of Paraguayan bonds as security for the national debt, and many a peasant pays rent to foreign owners of land. An important crop is maté (*Ilex paraguayensis*), whose withered leaves are used as tea, the beverage being very popular in Paraguay, Brazil, Argentina, and some other South American countries. Its stimulant properties resemble those of coffee and tea. Half of the crop is consumed at home. The crop is gathered from the wild shrub in the forest or from the cultivated plant, and though the adjacent districts of Brazil also produce it, that of Paraguay is superior in quality. The native orange trees yield an enormous crop. Almost every house has its orange grove. Immense quantities are exported. Maize, the great cereal crop, is the staple food. Wheat, rice, and other cereals are raised, but not in sufficient quantities to supply the home demand. Tobacco is a large crop, it is consumed in enormous quantities and is an important export. Among other vegetable products are sugar cane, coffee, cotton, and ramie. Stock breeding has not yet attained its proper development, but the number of cattle is increasing and in 1914 was estimated at 4,000,000. Good grazing lands are abundant in east Paraguay, and ranches are being opened on the plains of the Gran Chaco. The cattle are used chiefly for meat (including jerked beef) and for hides, which are a large export. Among the numerous forest products the *Quebracho colorado*, now found only in the Chaco, is most important. Its bark, which is very rich in tannin, is used for tanning, and its wood for railroad ties and other purposes. The export of forest products for Europe and other parts of

the world is increasing, though the difficulty of carrying them to the Paraguay and Paraná rivers for shipment is still great. Paraguayan woods for piles in the harbor works of Argentina and Uruguay and for railroad ties are in large demand.

Manufactures. The country has made little advance in general industries. There is some manufacture of spirits from sugar cane and also of sugar, leather, cigars, brick, furniture, etc. The principal manufactures are in Asunción. Many of the Indians, under the tuition of the Jesuits, have become skilled in various trades.

Commerce. The reported values of imports and exports have been as follows, in thousands of pesos gold (1 peso = 96.47 cents):

	1906	1908	1910	1912	1913	1914
Imports.....	6267	4073	6248	5283	8120	5149
Exports.....	2695	3732	4785	4211	5631	4584

The largest imports are cotton goods, food-stuffs, and hardware. Leading exports in 1912: fresh fruits, 1,284,000 pesos; hides, 1,083,000; woods, 877,000; maté, 501,000; tobacco, 442,000. There is a considerable export of quebracho extract. In 1912 Germany stood first in the import trade, the United Kingdom second, and Argentina third; in the export trade, Argentina first (more than one-half), Germany second, and Uruguay third. Exports to other countries are relatively unimportant. It should be noted, however, that many of the exports to Argentina and Uruguay are reexported to Europe and the United States.

Transportation and Communications. Four fairly good roads lead from Asunción to various parts of the country. With these exceptions there are scarcely any wagon roads, and land transportation is difficult and costly. A number of the tributaries of the Paraná and Paraguay are important in the transportation of forest products to those rivers, but the stage of water in them is often too low for navigation. Thus it is very difficult at times to deliver a part of the maté crop at the large rivers for shipment. The traffic of the country is centred on its two great rivers, the Paraguay carrying the larger part of it. Some of the largest river steamers in the world ply between Asunción and Buenos Aires. The length of railway in operation in 1913 was 468 kilometers (291 miles). Asunción is connected by rail with Buenos Aires. The first through train left the latter city Oct. 3, 1913, on a 50-hour schedule. The distance by rail between the two cities is 1518 kilometers, of which 376 kilometers are Paraguayan. Trains are ferried across the upper Paraná between the Argentine town of Posadas and the Paraguayan town of Encarnación. During 1914 and 1915 a branch was under construction eastward from Borja, a town a short distance south of Villa Rica; it is planned to extend this line to a point on the upper Paraná opposite the Brazilian town of Iguassú. There are about 2500 miles of telegraph line and 385 post offices.

Government. The present constitution was adopted by a popularly elected convention of 60 delegates which met at Asunción on Aug. 15, 1870. The government is that of a centralized republic. The legislative power is vested in a Congress consisting of a Senate and a Chamber of Deputies. Both Senators and Deputies are

chosen by popular vote. The executive power is vested in a President chosen for four years by an electoral college. He is eligible to reelection only after an interval of eight years. He is aided in the exercise of his functions by a responsible ministry of five members. In case of death or incapacity of the President he is succeeded by a Vice President, who is ex-officio President of the Senate. The judicial power is vested in a supreme court, consisting of two associate justices and one chief justice; five inferior courts; and a series of magistrates' courts, of which there is one in each town of importance. The justices are appointed by the President with the consent of the Senate for a term of four years. The powers of the executive and of Congress, the guaranties in behalf of civil liberty, the provision for amending the constitution, etc., are quite similar to those in the Constitution of the United States. Capital, Asunción (q.v.).

Finance. The revenues and expenditures are small as compared with those of most other countries. The budget for 1913 showed estimated revenue of 3,248,000 pesos gold and 21,688,000 pesos paper, and estimated expenditure of 1,863,000 pesos gold and 48,307,000 pesos paper; for 1914, estimated revenue of 3,860,000 pesos gold and 28,185,000 pesos paper, and estimated expenditure of 1,768,000 pesos gold and 67,090,000 pesos paper. The gold unit of value is equivalent to 96.47 cents; the paper peso was worth about 7 cents in 1913 and about 5 cents in 1914. The principal sources of revenue are import duties (estimated at 2,616,000 pesos gold for 1914), export duties (837,000 pesos gold), and direct taxes (20,093,000 pesos paper).

Paraguay incurred a large foreign debt chiefly on account of prolonged civil wars. As a result of the country's failure at times to meet its obligations, it has been necessary to make arrangements for scaling the debt and reducing the interest. The debt in 1874 amounted to \$7,527,000 (gold), but it was agreed in 1885 that in exchange for this debt new bonds to the amount of \$4,250,000 should be issued. An arrangement was also made for the future payment of interest, and land was assigned to creditors in payment of arrears of interest up to July, 1886. The holders of these unpaid interest coupons received land warrants, and the Paraguay Land Company, later known as the Anglo-Paraguayan Land Company, was formed to deal with these warrants. Another arrangement was made with the bondholders in 1895 for the reduction of interest, refunding of interest coupons in arrears, the creation of a sinking fund, and the assignment of securities. The outstanding public debt, as reported for Dec. 31, 1913, was 4,958,773 pesos gold and 81,741,150 pesos paper, made up as follows: foreign debt, 3,914,138 pesos gold; internal debt, 349,120 gold and 67,744,260 paper (including outstanding paper money); floating debt, 695,515 gold and 13,996,890 paper.

The principal banks are the Bank of the Republic, opened in 1908 with a capital of 6,000,000 pesos gold; the Mercantile Bank, capital 20,000,000 pesos paper; and the Agricultural Bank, capital 14,531,000 pesos paper. With the exception of a few small nickel coins, paper is the only circulating medium.

Both the metric system (legal since 1866) and the old Spanish system of weights and measures are in use.

Defense. The regular army numbers about

100 officers and 2500 men, trained after the German model. The infantry is armed with the Mauser rifle. A compulsory-service law (two years) became operative in 1914. The navy includes one small dispatch boat and two steam transports.

Population. The population of Paraguay cannot be stated with accuracy. A census of 1899 returned 643,852 inhabitants. An estimate of 1911 was 800,000, exclusive of some 50,000 Indians in the Chaco; but some observers believe that this figure is too large. The population in Paraguay proper is largely a mixture of Guaraní, Spanish, and negro; there are also many persons of pure, or nearly pure, Guaraní blood. The Paraguayans are a hospitable, well-meaning people, whose prosperity has been greatly retarded by terrible misrule. Foreigners number between 20,000 and 30,000, about one-half being Italians and one-third Argentines. The largest town is the capital, Asunción, whose population in 1914 was reported to be "rapidly approaching 100,000": Villa Rica, about 90 miles southeast of Asunción, is supposed to have some 30,000 inhabitants; Concepción, about 135 miles north of Asunción, 25,000; Carapegua and Luque, 15,000 each; Paraguari and Villa del Pilar, 10,000 each.

Although encouraged by the government, immigration is small, owing partly to the troubled history of the country, the alienation of large blocks of lands to syndicates, and the nearer opportunities presented by Argentina. Immigrants from 1882 to 1910 numbered 18,360; in 1910-11, 418; in 1911-12, 605.

Education and Religion. Primary instruction is free and nominally compulsory, but schools are not everywhere available, and probably only about one-fifth of the adult population can read and write. Public schools are reported to number about 800, with some 50,000 pupils. In addition, there are a number of private schools, some being subsidized by the government, and a few private Protestant schools. There are two agricultural schools. At Asunción is a national college, with over 500 students. Roman Catholicism is the state religion, but the public exercise of other worship is permitted. The law of civil marriage was introduced in 1898.

History. The native inhabitants of the region above the junction of the Paraná and the Paraguay rivers belong to the warlike race of the Guaraní (q.v.). The country was first explored in 1526 by Sebastian Cabot, who made his way for several hundred miles up the course of these two streams. In 1529-30 Diego García entered the same region, and in 1536 Juan de Ayolas laid the foundation of a town at Asunción. He was murdered by the natives, but Martínez Irala, who succeeded him, soon put the colony in a prosperous condition, and it promised to become one of the most important in South America. His power was largely personal, however, and after his death a period of anarchy ensued, which effectually destroyed Spanish influence over the natives. The country was considered as a dependency of the Viceroyalty of Peru, which exercised, however, little more than nominal oversight. The history of Paraguay is chiefly remarkable for the long civil and religious domination of the Jesuits, extending from 1609 to 1768. The missions—or reductions, as they were called—were not only centres of education and civilization, skillfully directed to appeal

to the habits and imagination of the natives, but they were refuges from the rapacity and oppression of the Spanish conquerors, and as such acquired an influence and moral ascendancy in many ways analogous to that exercised by the monasteries of Europe in the early Middle Ages. The disciplinary rule of the Jesuits was thorough. They instituted a penal code with carefully graduated penalties and established large schools for the education of the children. The economic character of the reductions was largely communal, in keeping with native customs and traditions. After the expulsion of the Jesuits the missions soon became deserted. At that time (1768) there were in the various Jesuit stations some 400,000 natives. In 1776 Paraguay was included in the Viceroyalty of Río de la Plata. The Spanish government was overthrown in 1811. The last governor quietly resigned his office, and his place was taken by a triumvirate, one of whose members was José Gaspar Francia (q.v.). In 1816 Francia was made dictator and ruled the country with absolute power until his death, in 1840. His rule was based on a policy of national isolation. He attempted to cut off all intercourse with other states and actually closed the Paraguay River to navigation. In the congress which was assembled to provide a new executive, Carlos Antonio López (q.v.) became the dominant figure. In 1844 he was named President for 10 years, but succeeded to all the absolute power of Francia. His dictatorial policy, however, was somewhat milder. He adopted many liberal reforms, attempted to form a constitution, and abandoned the policy of isolation. At his death, in 1862, he was succeeded by his son, Francisco Solano López (q.v.). The younger López was an ambitious despot, and with the idea of forming an empire he plunged the country into a disastrous five years' war with Argentina, Brazil, and Uruguay. The struggle exhausted the country, decimated the male population, and was terminated with the death of López at Aquidaban, in 1870. After the establishment of peace and the withdrawal of the allied armies a liberal constitution was adopted, and the painful process of the regeneration of the country began. The Republic has been rather free from revolutions since 1870, a fact which has contributed to the nation's progress. The significant feature of the history of the country during recent years has been the agricultural and railway development rather than political activity. President Benigno Ferreira was overthrown in 1908 and was succeeded by Vice President Emiliano González Navero. Civil war occurred during 1911-12, but in the latter year Eduardo Schaerer assumed the presidency and inaugurated an epoch of peace. Reforms were made in the administration of the laws, and measures were taken to continue peace and secure prosperity.

PARAGUAY RIVER. A river of South America, the largest tributary of the Paraná (qv). It rises on the plateau of Matto Grosso and flows in a general southward direction, at first wholly in Brazil, then on the boundary between Brazil and Bolivia, then through the centre of Paraguay, and finally, below Asunción, on the boundary between Paraguay and Argentina until it joins the Paraná near Corrientes (Map: Paraguay, H 2). Its total length is about 1500 miles. Its sources are a series of lakes called As Sete Lagoas, which are believed to be also the source of a head stream of the Tapajoz, which flows into the Amazon. After leaving the plateau in a series of rapids the river flows for the rest of its course with a tranquil current over an almost level bed through the great plains known as the Gran Chaco and the Pampas. The upper part of this plain above the Bolivian frontier forms the marshes called the Laguna de los Charayes (Charayes). This tract is converted during the annual floods into a vast lake over 100 miles wide and several hundred miles long, leaving exposed only a few islands and the rows of trees which line the banks of the permanent streams. Below the Charayes the river is again confined to its banks by spurs of the plateau, and farther south its bed is so deeply cut into the plain that the latter generally escapes inundation. Below Asunción, however, the banks again become marshy. From the escarpment of the plateau to the confluence with the Paraná, a distance of 900 miles, the river is entirely free from obstructions and is navigable at all seasons for small vessels, which can also ascend the São Lourenço to Cuyabá in Brazil. Steamers drawing 9 feet can at all seasons reach Corumbá at the south end of the Charayes, and the river is the principal commercial outlet for Matto Grosso and Paraguay. Two lines of river steamers ply regularly between Asunción and Buenos Aires, and many ocean-going vessels enter the former port each year. The longest tributaries of the Paraguay are the Pilcomayo and the Berhejo. The river was discovered by Sebastian Cabot, who in 1526 ascended the Paraná as far as the confluence.

PARAGUAY TEA. A South American shrub. See BEVERAGE PLANTS. MATÉ
Vol. XVIII.—4

PAR'AHÉLIOTROPISM (from Gk. *παρά, para*, about + *ἥλιος, hēlios*, sun + *τροπή, tropē*, a turning, from *τρέπειν, trepein*, to turn). A sensitiveness of plant organs, especially of leaves, by virtue of which they take the position of least illumination when exposed to intense light. Paraheliotropic leaves may turn their tips either towards or away from the source of light. In either case the response brings the plane of the leaf parallel to the direction of the incident light rays. Thus the leaf is much less strongly illuminated than in the diheliotropic position, at right angles to this direction. Many plants of the pea family show this response on bright days in summer. See HELIOTROPISM. TROPISM.

PARAHYBA, or **PARAHIBA**, pi'râ-ê'ibá. One of the smaller states of Brazil, lying in the easternmost part of the country and bounded by the State of Rio Grande do Norte on the north, the Atlantic Ocean on the east, Pernambuco on the south, and Ceará on the west (Map: Brazil, K 5). Area, 21,620 square miles. The surface is low and undulating on the coast, but the greater part consists of an elevated plateau whose slopes are heavily forested. The climate is hot, dry, and healthful, but the soil in the interior supports only a scanty vegetation. Agriculture is the chief industry and is carried on along the coast. Cotton is the principal product. Parahyba ranks second among the states of Brazil in the production of this article. Sugar cane, coffee, coconuts, tobacco, and cereals also are raised. Pop., 1913 (est.), 558,550, consisting largely of Indians and negroes. The capital is Parahyba (qv).

PARAHYBA, or **PARAHIBA**. The capital of the State of Parahyba, Brazil, situated on the river of the same name, about 10 miles from the sea and 50 miles north of Pernambuco (Map: Brazil, L 5). The town lies partly on hills and partly in a plain, the former section is the old city and has dwindled away, while the newer portion, along the river, forms, with its port of Cabedello, the business quarter. The most notable structures are the cathedral and a former Jesuit college, which contains the state offices. The harbor of Cabedello is deep enough for vessels of 15-foot draft, and from it sugar and cotton are exported. Pop. (est.), 35,000. Parahyba was founded by the Portuguese in 1579, being one of the oldest settlements of Brazil.

PAR'ALACTIC ACID. See LACTIC ACID.

PARAL'DEHYDE (from Gk. *παρά, para*, beside + Eng. *aldehyde*, clipped form of Neo-Lat. *alcohol dehyd-rogenatum*, alcohol deprived of hydrogen). A polymeric form of aldehyde with the symbol $C_6H_8O_4$, occurring as a colorless or pale-yellow oily liquid, moderately soluble in water and freely in ether and alcohol. It is obtained by treating aldehyde with dilute sulphuric acid or dilute nitric acid. In medicine it is used as a hypnotic (see HYPNOTICS) principally, rarely as a diuretic and antispasmodic. Excitement follows its use, which is succeeded by sound and refreshing sleep, without digestive or cerebral disturbance. It does not weaken the heart's action. Its disagreeable taste and its tendency to impart an offensive and persistent odor to the breath are serious drawbacks. Its frequent use may result in the formation of a habit. See ALDEHYDE.

PAR'ALLAX (from Gk. *παράλλαξις, parallaxis*, alternation, from *παλλάσσειν, parallassein*, to make alternate, from *παρά, para*, beside

+ ἀλλάσσειν, *allassein*, to alter, from ἄλλος, *allos*, other). The apparent displacement of an object caused by a change of place of the observer. When an object at *M* (Fig. 1) is looked at from

FIG. 1.

P, it appears in line with some other object, *S*, but, after the observer has moved to *E*, *M* has apparently retrograded to a position in line with *S'*; this apparent retrogression is called *parallax*. The angle *PME* is called the *angle of parallax* and is the measure of the amount of parallax. To astronomers the determination of the parallax of the heavenly bodies is of the greatest importance, for two reasons—first, from the necessity of referring all observations to the earth's centre, i.e. so modifying them as to make it appear as if they had been actually made at the earth's centre, and secondly, because parallax is our only means of determining the magnitude and distance of the heavenly bodies. The *geocentric* parallax, the apparent displacement of a heavenly body due to its being observed from a point on the surface of the earth instead of from its centre, may be determined as follows: Let *P* and *P'* be two stations on the surface of the earth (Fig. 2), *E* its centre, *M* the object to be

FIG. 2.

observed, and *Z* and *Z'* the zeniths respectively of the observers at *P* and *P'*; then at *P* and *P'* let the zenith distances, *ZPM* and *Z'P'M*, be observed simultaneously, and since the latitudes of *P* and *P'*, and consequently the angle *PEP'*, are known, from these three the angle *PMP'* (the sum of the parallaxes at *P* and *P'*) is at once found; and then by trigonometry the separate angles or parallaxes *PME* and *P'ME*. When the parallax of *M*, as observed from *P*, is known, its distance from *E*, the centre of the earth, can be at once found in terms of the earth's radius as a unit. When the heavenly body is on the horizon, as at *O*, its geocentric parallax is a maximum and is known as the *horizontal parallax*.

In the case of the fixed stars, which are so far away that to them the earth's radius subtends only an infinitesimal angle, it becomes necessary to make use of a much larger base line than the earth's radius, and, as the largest we can employ is the radius of the earth's orbit, it accordingly is made use of, and the displacement of a star, when observed from a point in the

earth's orbit instead of from its centre, the sun, is called the *annual* or *heliocentric* parallax. Here the base line, instead, as in the former case, of being 4000 miles, is about 92,800,000 miles, and the two observations necessary to determine the parallactic angle are made from two points on opposite sides of the earth's orbit, at an interval as nearly as possible of half a year. Yet, notwithstanding the enormous length of the base line, it bears so small a proportion to the distances of the stars that only in a few cases have they been found to exhibit any parallactic motion whatever, and in no case does the angle of parallax amount to 1". See *STAR*.

Solar Parallax. The extremely precise determination of this quantity is very important, since the solar parallax is our only means of determining the distance of the sun from the earth. This is the fundamental unit of distance in astronomy. Upon it depend directly all our notions as to the magnitude and distance of the other members of the solar system and of the universe in general. The solar parallax problem is not only the most important one in fundamental astronomy, but it is also, perhaps, the one offering the greatest difficulty in solution. Astronomical instruments enable us to submit to actual measurement only the directions in space of the heavenly bodies, never their distances. These latter must be obtained by computation from measured directions or angles, and for this purpose some base line is indispensable. The largest possible terrestrial base line is, of course, a diameter of the earth. Yet so small is even this, compared with the distance of the sun, that it would subtend an angle of only about 18 seconds of arc to an imaginary observer at the sun's centre. When we reflect that an angle of one second corresponds to only three-tenths of an inch at a distance of one mile, we get some idea of the extreme minuteness of the earth's diameter as seen from the sun.

It is never possible, of course, to get a *complete* diameter of the earth for a base line, but extraordinary efforts have been made to come as near as possible to this ideal condition. For many years observations of transits of Venus were considered the most favorable means of measuring the small angular differences of direction of the sun's centre as seen from opposite sides of the earth. No expense was spared, especially at the transits of 1874 and 1882, to secure very complete observations. Yet, although the various civilized governments of the world sent out numerous and most elaborately equipped observing expeditions, the whole operation turned out practically a failure. It was simply impossible by this method to secure observations of the requisite precision. Of late years two other methods have been pretty generally agreed upon as the best. The first is based upon the so-called constant of the aberration of light. (See *ABERRATION OF LIGHT*) It is known that the directions in which we see the stars are apparently thrown forward towards that point on the sky to which the orbital motion of the earth is carrying the observer. It is a phenomenon analogous to the well-known fact that if a man be running in a rainstorm the falling drops *seem* to slant towards him, though they may really be falling vertically. So their direction seems to be thrown forward in the direction of the observer's motion. In the case of the earth's orbital motion around the sun the observer will be moving in opposite directions in space at intervals of

half a year. Consequently the effect of aberration is reversed, and the so-called "constant" or amount of aberration admits of determination from the differences of observations made six months apart. The solar parallax can then be computed from the aberration constant, since we know with quite sufficient precision the velocity of the transmission of light in space. The determinations made by this method have been principally in connection with the study of latitude variation.

The other accredited method of determining the parallax is by observations of the planetoids. The method is extremely simple in practice and also very accurate. It is necessary merely to await a time when one of these little bodies is favorably situated for observation and then to fix its position telescopically with respect to the neighboring stars. Let this be done simultaneously at two observatories situated very far apart on the earth and using, of course, the same stars in both places. Then it is clear that the position determined for the planet will not be quite the same at the two observatories. The base line is the straight line joining the two observatories. As a result we obtain directly the distance of the planet from the earth, in terms of this base line as a unit. But this is known in miles from existing geodetic surveys of the earth. Thus we arrive at a knowledge, in miles, of the planetoid's distance. But from the ordinary processes of astronomical observation we know the elements (q.v.) of the planetoid's orbit. We can find from these, by a simple computation based on Kepler's laws, the distance of the planetoid from the earth in terms of the latter's distance from the sun. Knowing then the distance between the earth and planetoid in miles from the special parallax observations, and in terms of the distance "earth sun" from theory, we can at once deduce the value of the latter distance in miles. This, combined with our knowledge from geodesy of the terrestrial radius in miles, enables us to compute the angle subtended by that radius to an observer in the sun—in other words, the solar parallax.

The planetoid method was put in operation by no less than 25 observatories, at which observations were made on the planetoids Iris, Sappho, and Victoria. By thus increasing the number of observation stations the precision of the final result could not fail to be greatly enhanced. The entire "campaign" was planned and managed by Gill, of the Cape of Good Hope Observatory. The observatories taking a principal part in the work, in addition to that at the Cape of Good Hope, were those at Bamberg, Leipzig, Göttingen, and, in America, Yale University. All these observatories are provided with the modern heliometer (q.v.), the most precise apparatus for measurement on the sky at present known to science. Gill's final result for the solar parallax, published in 1897, was $8.802''$, equivalent to a solar distance of 92,874,000 miles.

It may be of interest here to show the relative importance or "weight" of the various parallax methods. The general work of high authority on this topic is the *Fundamental Constants of Astronomy*, by Simon Newcomb (Washington, 1895). Newcomb assigned the following weights, or relative degrees of precision:

From the aberration constant.....	weight 68
From the planetoid method.....	weight 20
Six other methods combined.....	weight 35

Newcomb was already at that time in possession of the preliminary results of Gill's researches, communicated to him in advance of publication. But later several important series of aberration determinations were made public, and the results exhibited certain small discordances among themselves, which discredited somewhat the aberration method and consequently enhanced the relative weight of the planetoid method. The latter method gained also from the discovery in 1898 of the planetoid Eros (q.v.), which is much more favorably situated for parallax determinations than any previously known. Accordingly, an international campaign of observations on Eros was undertaken at its opposition in 1900-01, and the value of the solar parallax, as finally reduced by Hinks, was found to be $8.7968''$. Another and more favorable opportunity for the observation of this planetoid will occur in 1931, and a more thorough plan for international coöperation on that occasion has been initiated.

The final result for the solar parallax at present accepted by astronomers in general is $8.80''$, corresponding to a distance of 92,789,000 miles between the earth and the sun.

PARALLELEPIPED (ML. *parallelepipedum*, from Gk. *παράλληλεπῖπενον*, *parallēlepēdon*, from *παράλληλος*, *parallēlos*, parallel, from *παρά*, *para*, beside, beyond + *ἀλλήλων*, *allēlōn*, of each other, from *ἄλλος*, *allos*, other + *ἄλλος*, *allos*, other, + *ἐπίπενον*, *epēdon*, plane surface, from *ἐπί*, *epi*, upon + *πέδον*, *pedon*, ground), at one time commonly (United States) spelled **PARALLELOPIPED**. A solid figure having six parallelograms for faces. Therefore any two opposite faces are equal and parallel. If the faces are all squares the parallelepiped is a cube. The volume of a parallelepiped is found by multiplying its base by the altitude.

PARALLEL FORCES. See MECHANICS.

PARALLELISM. A term used in philosophy to denote a hypothetical relation of matter and consciousness. In the history of philosophy Spinoza is the most thoroughgoing parallelist, holding that matter and ideas are both attributes of one divine subject, and that every material object, or instance of the material attribute, has its ideal counterpart. In modern times the term "parallelism" is used more particularly in psychology and in epistemology to denote the specific parallelism of the human (or animal) body with the concrete consciousness of man (or lower animal). In this usage parallelism means the concomitance of brain process and mental process. It is distinguished from interactionism, which holds that mental processes may cause and precede brain processes and conversely. Psychologists, however, do not accept parallelism as an explanatory theory, but only as a hypothetical statement of a relation of body and mind which may be used as a basis for the formulation of psychophysical facts. The solution of the ultimate problem is by them held in abeyance or referred to the epistemologist. See **BODY AND MIND**; **DUALISM**; **KNOWLEDGE**, **THEORY OF**; **MIND-STUFF THEORY**; **OCCASIONALISM**.

PARALLEL KEY. See **KEY**.

PARALLEL MOTION. See **MECHANICS**.

PARALLELOGRAM (Lat. *parallelogrammum*, from Gk. *παράλληλογράμμος*, *parallēlogrammos*, neut. sing. of *παράλληλόγραμμος*, *parallēlogrammos*, bounded by parallel lines, from *παράλληλος*, *parallēlos*, parallel + *γράμμα*, *gramma*, line, let-

ter, from *γράφειν*, *graphein*, to write). A quadrilateral whose opposite sides are parallel. From this it follows that the opposite sides must be equal and the opposite angles must also be equal. Therefore, if one angle of a parallelogram is a right angle, all of them are right angles, and the figure is then called a *rectangle*; and if at the same time all the sides are equal, the figure is a *square*. If the sides are equal, but the angles not equal, it is a *rhombus*. If only the opposite sides are equal, it is a *rhomboid*.

RECTANGLE.

SQUARE.

The diagonals of a parallelogram bisect each other, each bisects the parallelogram, and the sum of their squares is equal to the sum of the squares of the sides of the parallelogram. All

RHOMBUS.

RHOMBOID

parallelograms which have equal bases and equal altitudes are equal in area, and this area is found by multiplying the base by the altitude.

PARALLELOGRAM OF FORCES. See MECHANICS.

PARALLELOPIPED. See PARALLELEPIPED.
PARALLELS (Fr. *parallèle*, from Lat *parallelus*, *parallelus*, parallel) In military fortifications, trenches cut in the ground, parallel to the position under siege, and designed to protect the men and guns of the besiegers from the fire of the besieged. See SIEGE AND SIEGE WORKS; FORTIFICATION.

PARALLELS, OF CIRCLES OF LATITUDE. Circles drawn round the surface of the earth parallel to the equator. They are the intersections with the earth's surface of planes which cut the earth at right angles to its axis. The greatest of these circles is the equator, which has the centre of the earth for its centre, the radius of the earth for its radius, and is equally distant at all points from each pole. It is evident that, of the others, those next the equator are greater than those more remote, and that they become less and less till at the poles they vanish altogether. The radius of any one circle is equal to the earth's radius multiplied by the cosine of the latitude, if we regard the earth as a sphere. The rotary velocity of the earth's surface, which is about $17\frac{1}{4}$ miles per minute at the equator, is therefore about $8\frac{1}{2}$ miles in lat. 60° and in lat. $89\frac{1}{2}^\circ$ (within 35 miles of the pole) is not more than 267 yards per minute. The most important parallels of latitude are the tropics of Cancer (lat. $23^\circ 28' N$) and

Capricorn (lat. $23^\circ 28' S.$), and the Arctic (lat. $66^\circ 32' N.$) and Antarctic circles (lat. $66^\circ 32' S.$). See LATITUDE AND LONGITUDE; MAP.

PARALLEL SAILING. See SAILINGS.

PARALYSIS (Lat., from Gk. *παράλυσις*, palsy, paralysis, from *παράλυν*, *paralyein*, to disable the side, from *παρά*, *para*, beside, beyond + *λύνειν*, *lycin*, to loose), sometimes called PALSY. Complete loss of the power of voluntary movement. A mere weakening or partial paralysis of the voluntary muscles is termed paresis. Since the muscles depend for their motor impulses on the nervous system, lesions of this part of the organism are responsible for paralysis in the majority of instances. It must be noted, however, that loss of motor function occasionally arises from disease of the muscle itself, as in certain dystrophies; or the will power may be at fault, as in hysteria.

Paralysis may be caused by lesions of the brain, of the spinal cord, of the nerve trunks or their terminations. It may be central or peripheral, according as its origin is in the central nervous system or in the nerve trunks or their endings. When a single member, such as an arm or leg, is affected, the term "monoplegia" is used. Simultaneous paralysis of both sides of the body is termed paraplegia. When the entire half of the body is paralyzed the condition is known as hemiplegia. Paralysis of all the extremities, with spasm, is denominated diplegia. Brain paralyzes are usually hemiplegic, and the paralysis is on the opposite side of the body from that of the lesion, except when the pons is involved. Then there occurs what is termed crossed paralysis, i.e., facial paralysis on one side and paralysis of the extremities on the other. Paralyzes originating in the spinal cord are apt to be paraplegic, i.e., affecting all parts below the level of the lesion. Peripheral paralyzes are limited to the area supplied by the nerve or nerves involved. Cerebral paralyzes are due in general to apoplexy (q.v.), injuries of the skull and dura, collections of fluid in the ventricles (as in hydrocephalus), abscess, and tumor. In the spinal cord injuries to the vertebrae, resulting in pressure, occasion paralysis below the point of injury; myelitis (q.v.) is a common cause, and infections such as infantile spinal paralysis (q.v.) and tumors may have the same effect. The peripheral nerves may be involved by the pressure of fractures, they may be severed by injury, and they may become inflamed as in neuritis. Peripheral paralyzes are peculiarly apt to arise from poisons such as alcohol, lead, tobacco, and mercury. A few specific diseases to which the term "paralysis" is applied may be briefly described.

Hemiplegia, popularly known as paralytic stroke or stroke of apoplexy, affects the entire half of the body, including the face and tongue. The affection is noticed under APOPLEXY. Facial paralysis (Bell's palsy) is due to injury or inflammation of the seventh nerve, although it may be central in origin. One side of the face is usually involved, but double facial paralysis is occasionally observed. Paralysis agitans is described under its proper title, as is also acute anterior poliomyelitis or infantile spinal paralysis. Bulbar paralysis occurs in an acute form, from hemorrhage into the medulla or pons or of thrombosis or embolism of the arteries supplying these centres; an asthenic form (Erb's disease, myasthenia gravis); and in a chronic

progressive form, due to degeneration of the nuclei of the eighth, ninth, tenth, eleventh, and twelfth cranial nerves in the medulla. The symptoms characteristic of bulbar paralysis are loss of control over the muscles of the lips, tongue, and pharynx, whence arises the difficulty of chewing, swallowing, breathing, and speaking experienced by those affected.

Acute ascending (Landry's) paralysis is a rare disease, marked by a loss of power first appearing in the feet and rapidly extending upward until the medulla is reached and death ensues. The cause is obscure, and the disease often terminates fatally within a week. Duchenne's paralysis is a chronic affection characterized by progressive muscular weakness with an apparent hypertrophy of the muscles. It is a disease of children under 10 years of age. The muscles of the calf are first attacked, but the remaining muscles of the body are soon involved, and the patient becomes absolutely helpless before death. The disease is a purely muscular one, consisting of an overgrowth of fibrous tissue at the expense of the muscle elements, with fatty deposition and degeneration. Pseudohypertrophic muscular paralysis is noticed under **MUSCLE DISEASES**.

General paralysis of the insane (paretic dementia) is an organic disease of the brain, characterized by inflammation of the meninges and cortex, with thickening of the former and wasting of the latter. The malady is most common in males between the ages of 30 and 60 and is brought on by overwork, intemperance, syphilis, or lead poisoning. In the beginning there is a period marked by mental disturbance, alienation, fine muscular twitchings, especially of the tongue and facial muscles; then follows a period of progressive mental failure and physical decay, and finally there is a complete breaking down of all the mental, motor, sensory, and nutritive functions.

Infantile cerebral paralysis may be hemiplegic, diplegic, or paraplegic. The paralysis is spastic, i.e., there is spasm and rigidity of the muscle in addition to the paralysis. The affection arises from diseases of the mother during pregnancy, accidents during delivery, or later it may be caused by specific infections such as meningitis, diphtheria, scarlet fever, etc., or by traumatism. The onset is marked by convulsions and coma, fever, delirium, and vomiting. As consciousness returns, paralysis is discovered, which may partially disappear. When the lower extremities are affected, as often happens, walking is nearly or quite impossible. Recently surgeons have been able to bring about great improvement in these cases by section of the posterior spinal nerve roots. Some of these children become epileptics and others are feeble-minded.

Spastic spinal paralysis (lateral sclerosis; spinal paralysis of the adult) is a disease of early adult life, of obscure causation, but assigned usually to syphilis, injuries, lead poisoning, or the acute infectious fevers. The symptoms are gradual loss of power, combined with rigidity of the muscles. Spasms attack the legs so that they are bent back rigidly to the pelvis. When walking the patient has a characteristic gait, the legs dragging and the toes catching against the ground. The disease is chronic, progressive, and incurable.

Hysterical paralyses may involve any muscle of the body and are too numerous to be men-

tioned here. (See **HYSTERIA**.) A specific form of spastic paralysis of the legs is observed in India and Tibet, as a consequence of eating flour made from *Lathyrus sativus*. The malady is known as lathyrism, lupinosis (q.v.), or chick-pea disease. See **FACIAL PARALYSIS**.

PARALYSIS AGITANS (Lat., shaking palsy), **PARKINSON'S DISEASE**, **SHAKING PALSY**. A chronic progressive nerve disease, in which the principal symptoms are tremor, muscular rigidity, restlessness, weakness, and altered sensations. It was first described by Parkinson (q.v.) in 1817. It occurs more frequently in males, and generally between the ages of 50 and 70. It is caused by exposure, hard labor, and great fatigue. Fright or injury may immediately precede an attack. The earlier symptoms are pains in one arm, with tremor of one hand, the fingers working together as if the patient were pulling or picking at something (pill rolling). Stiffness in the arm follows, and the process invades the leg of the same side. The neck becomes stiff and the body bent forward. The face is immobile, the voice high pitched and mumbling, the gait festinating, i.e., the steps become faster and faster until the patient has to stop to prevent falling forward. The disease lasts from 3 or 4 to 12 years. The pathological changes found consist of hypertrophy of the nerve cells of the pons, induration of the pons, medulla, and cord, thickening of the blood-vessel walls and of the pia, and increase of connective tissue in the motor tracts, nerves, and muscles. (Dana.)

The most successful treatment consists of rest, freedom from mental anxiety, outdoor air, warm baths, and massage. Among drugs, hyoscine, codeine, quinine, arsenic, cannabis, veratrum, salicin, nitrate of silver, conium, atropine, and phosphorus have been used to relieve various conditions and with varying results. Berkeley recommends parathyroid-gland extract, with which he has obtained a most favorable effect. Similar good effects have been derived from the use of pituitary extract. The mental condition, which may be hysterical or emotional, sometimes delusional, is improved by strong mental influences, routine and control, and employment. Consult Osler, *Modern Medicine* (New York, 1915).

PARALYSIS OF THE THROAT. See **HORSE, Diseases of the Mouth**.

PARAMARIBO, pār'a-mār'i-bō. The capital of Dutch Guiana, South America, situated on the left bank of the Surinam River, about 17 miles above its mouth, in lat. 5° 50' N. and long. 55° 10' W. (Map: Guiana, Dutch, G 2). Its climate is very hot, the average annual temperature being over 80° F. Paramaribo has the neat appearance of a Dutch town, with its wide streets shaded with trees and lined with brightly-colored modern houses. The government buildings are situated near the river, forming the so-called government plain. There are a number of churches and synagogues. The harbor is safe and commodious, and fortified by the two forts of Zeelandia and New Amsterdam. A number of wharves are situated along the river. Paramaribo receives the entire trade of Dutch Guiana and is the seat of a number of foreign consuls. Pop., 1902, 31,729; 1912, 34,898, or 40 per cent of the entire population of Dutch Guiana.

PARAMATTA, pār'a-māt'ā. A town of New South Wales. See **PARAMATTA**.

PAR'AMEN'THANOL. See MENTHOL.

PARAM'ETER (from Gk. *παρά, para*, beside, beyond + *μέτρον, metron*, measure). As commonly used in mathematics, any constant quantity, i.e., a quantity fixed in value, entering into an equation. In analytic geometry it is used either as a constant or as a variable. Thus, the line in a conic section called by the ancient geometers *latus erectum*, by later writers *latus rectum*, and now known as the parameter, is a constant for any given curve, but a variable quantity for a family of curves of that type. For example, in the equation of a parabola (q.v.) $y^2 = 2px$, where p is the parameter, p remains constant, while x and y vary so as to generate the curve. But if p be given a new value, while x and y pass again through the same cycle of values, a new parabola will be formed; and by repeating the process any number of curves may be generated which are said to belong to the same family. The method of variation of parameters is an important one in the treatment of differential equations. The name "parameter" is due to Mydorge (1585-1647).

PARAMORPHINE, pǎr'á-môr'fín or -fén. See ALKALOIDS.

PARAMUSHIR, pǎr'á-mōō-shēr', or **PARAMUSHIRI**. The largest of the Kurile Islands (q.v.).

PARANÁ, pii'rá-ná'. The largest river of South America after the Amazon, and one of the great rivers of the world. It is formed by the confluence of the Paranahyba and the Rio Grande in south Brazil at the common boundary point of the states of Matto Grosso, Minas Geraes, and São Paulo (Map: Brazil, G 8). The Paranahyba rises on the Serra dos Ventos and flows southwestward on the boundary between Minas Geraes and Goyaz. The Rio Grande, which is the longer of the head streams and may be regarded as the true upper course of the Paraná, rises on the Serra da Mantiqueira in the Coast Range, 60 miles from the Atlantic Ocean near Rio de Janeiro. It flows northwest and westward to the confluence, whence the Paraná proper takes a southwest course through Brazil, then south on the boundary between Brazil and Paraguay, whence it curves westward between Paraguay and Argentina until it receives its largest tributary, the Paraguay River (q.v.). From this point the lower Paraná flows southwest through Argentina as far as Rosario, where it finally turns to the southeast and enters the Atlantic Ocean through the Plata estuary, at the head of which it is joined by the Uruguay River (q.v.). The total length of the Paraná River from the ocean to the source of the Rio Grande is 2950 miles, and excluding the Plata 2720 miles. The length of the lower Paraná from the Paraguay confluence is 850 miles, and with the Plata 1080 miles. The Paraná is thus longer than the Mississippi proper, and the drainage area of the system is nearly equal to that of the Mississippi.

In its upper course the Paraná flows over the great Brazilian plateau, and most of its upper tributaries, including the two head streams, are obstructed by falls and rapids as they descend over the successive escarpments of the higher plateaus. The main river itself has the Falls of Urupunga a short distance below the confluence of the head streams. Below this point, however, it is navigable for 600 miles over the level surface of the plateau as far as the bound-

ary of Paraguay. Here it descends over the final great escarpment in the Falls of Guayra, in which the river plunges through numerous rocky clefts with a total fall of 70 feet. From this point to within 150 miles of the Paraguay confluence the stream rushes through a deep gorge over a series of rocky shallows and rapids. Here the banks are heavily forested, and most of the tributaries fall into the river by cata-racts, of which the Victoria Falls of the Iguazú (q.v.) rival Niagara in height and grandeur. Below the gorge and the Paraguay confluence the river flows unobstructed through the Pampas plains, and for the last 1000 miles of its course, including the Plata, is navigable at all seasons by large vessels, while transatlantic steamers go directly to Rosario, 400 miles from the ocean. It is 3000 yards wide at Corrientes, near the Paraguay confluence, and 7000 yards wide at Diamante. It reaches its greatest volume at Corrientes, and loses considerably by evaporation in its lower course, since it here receives scarcely any permanent tributaries except the Salado (q.v.). Several hundred miles above the estuary it begins to divide into parallel channels, inclosing a long island, and has a total width of 25 to 30 miles, while some of the channels are 2 miles wide. The delta proper begins 100 miles from the estuary, and consists of a vast network of channels and backwaters, emptying by 14 mouths into the Plata estuary. The main channel is accessible to the largest vessels even at low water, but all the channels are constantly and rapidly shifting, calling for great caution in their navigation. For the description of the river below the delta, see PLATA, Río DE LA. The Paraná was first ascended as far as the Paraguay confluence in 1526 by Sebastian Cabot. Consult: Manuel Bernárdez, *De Buenos Aires al Iguazú* (2d ed., Buenos Aires, 1901); E. L. Corthell, *Two Years in Argentina* (San Francisco, 1903); W. S. Barclay, "The River Paraná: An Economic Survey," in *Geographical Journal*, vol. xxxiii (London, 1909).

PARANÁ. A state of southeast Brazil, bounded by the Atlantic Ocean on the east, the State of São Paulo on the north, Paraguay and Matto Grosso on the west, and Argentina and Santa Catharina on the south (Map: Brazil, G 8). Area 67,570 square miles. The low strip of coast land is followed by a mountain range reaching an altitude of nearly 5000 feet and passing into an elevated plateau lying about 3000 feet above the sea. The portion along the west frontier slopes towards the Paraná River, whose tributaries are the chief rivers of the state. Most of them, however, are unfit for navigation, owing to rapids. The climate is generally healthful in the elevated portions, but very hot and humid on the coast and in the valley of the Paraná. Forests cover a large part of the state, especially in the western half, which is almost unknown and is inhabited by roving Indians. The soil is very fertile. The chief product and export is yerba maté. Cotton, rice, coffee, and manioc are cultivated on the coast, and grains and fruit in the more elevated regions. Lumbering also is carried on to some extent. Much attention has been given to immigration and there are numerous Polish and German colonies in the state. Pop., 1900, 327,136; 1913 (est.), 480,404. Capital, Curitiba (q.v.). Consult Lange, *Südbrasilien* (2d ed., Berlin, 1885).

PARANÁ (formerly *Bajada del Paraná*). The capital of the Province of Entre Ríos, Argentina, situated on a high bluff on the Paraná River, 370 miles from its mouth and opposite the city of Santa Fé (Map: Argentina, H 4). It is a well-built town with straight streets, good public buildings, a normal school, and a national college. It has an important inter-provincial trade, has daily steamship connection with Santa Fé, and is a station for all steamers ascending the Paraná River. Pop. (est.), 40,000. From 1853 to 1861 Paraná was the capital of the Argentine Republic.

PARANAGUÁ, pã'rã-nã-gwã'. The chief seaport of the State of Paraná, Brazil, situated on the Bay of Paranaguá, 400 miles southwest of Rio de Janeiro (Map: Paraguay, K 3). A regular steamship line connects the port directly with Hamburg, and woods, maté, sugar, and cereals are exported. Pop. (est.), 10,000.

PARANAHYBA, pã'rã-nã-ẽbã. One of the head streams of the Paraná (q.v.).

PARANOIA (Neo-Lat., from Gk. *παράνοια*, madness, from *παρὰ*, *para*, beside, beyond + *νοεῖν*, *noein*, to think). An incurable form of insanity in which for many years the intellect of the patient remains unimpaired, though dominated by a systematized delusion. It is a chronic progressive psychosis occurring mostly in early adult life, characterized by the gradual development of a stable progressive system of delusions, without marked mental deterioration or clouding of consciousness, but with such disorder of thought and conduct as is conditioned by the delusions. There is almost invariably present an acquired or transmitted neurodegenerative taint, though an attack may be precipitated by a sudden or severe injury to the nervous system. It may follow an injury to the head.

Paranoics rarely present somatic evidences of degeneration, such as a deformed or asymmetrical skull, badly developed teeth, strabismus, atrophy of one side of the body, and differences in size of hands or feet. In several cases examined by Spitzka anomalies of the cerebrum were found.

Mild forms of paranoic condition are presented by persons who exhibit perverse acts, morbid ideas, persistence in absurd notions, and who are commonly called cranks. These persons become imbued with an idea, are dominated by it, and talk constantly of it. They are suspicious, consider themselves slighted or the subject of remark. They think they are neglected or martyred, fancy there is a combination against them, and are frequently melancholic. These patients are able to carry on a business or practice a profession. They are considered to be *formes frustes* of paranoia. Paranoid trends of thought occur in constitutional mental inferiors, whose minds become permanently dominated by delusional beliefs and the impulses springing from them. There is a paranoid form of dementia præcox in which persecutory ideas and belief in conspiracy occur, but dementia is the prominent symptom.

True paranoia is the ordinary type of chronic delusional lunatic who was eccentric in childhood and hypochondriac in his youth, and is excessively egotistical, whose failures are considered to be due to conspiracy, who betrays delusions of persecution and hallucinations of sight and hearing. The usual delusion of per-

secution may be replaced by systematized delusions of erotic, religious, or patriotic nature. As soon as the fixed idea appears, as a result of some delusional interpretation, the disease develops rapidly and is characterized by the unchangeability of the basic fixed idea, the faith of the patient in his delusions, the apparent logic of the delusional system, the promptness and intensity of his reactions, the existence of false interpretations (often including transferred personality), and the absence of intellectual enfeeblement. Paranoics have no insight into their condition. They often, under prolonged coaching, are able to conceal their delusions for years. The paranoic is usually homicidal, either because of mandatory hallucinations or of persecutory delusions. Early moral control may do much for mild cases, even aborting the psychosis. The regularity of life in asylums, with their discipline, recreations, and employment, is often beneficial.

The disease is more frequent than is supposed by those who have had no experience with criminals. The careful statistics of Matteawan State Hospital for the Criminal Insane in New York State showed over 30 per cent of paranoics in 1911. Consult: Richard von Krafft-Ebing, *Treat-Book of Insanity* (Philadelphia, 1905), A. R. Diefendorf, *Clinical Psychiatry*, adapted from Emil Kraepelin, *Lehrbuch der Psychiatrie* (2d ed., New York, 1907), Clark and Diefendorf, *Neurological Mental Diagnosis* (ib., 1908), Joseph Rogues de Fursac, *Manual of Psychiatry*, translated and edited by A. J. Rosanoff (3d Amer. ed., ib., 1911).

PAR'APET. See FORTIFICATION.

PAR'APH (OF, Fr *paraph*, *paragraphe*, It. *parafo*, *paragrafo*, from ML *paragaphus*, from Gk. *παράγραφος*, marginal line, from *παράγραφεῖν*, *paragraphein*, to write beside, from *παρά*, *para*, beside, beyond + *γράφειν*, *graphein*, to write). An addition to the signature formed by a flourish of the pen, which during the Middle Ages constituted some sort of provision against a forgery. Its use is not altogether extinct in diplomacy, and in Spain the paraph is still a usual part of a signature.

PAR'APHERNALIA (ML nom. pl., from Lat *parapherna*, from Gk. *παράφερνα*, property of a bride above her dower, from *παρά*, *para*, beside, beyond + *φέρν*, *phernē*, dower, from *φέρειν*, *pherein*, to bear). Articles of wearing apparel and ornament suitable to a wife's station in life, which were given to or acquired by her either before or during marriage. Both the Roman and the later civil law recognized a special property in the wife, as to her necessary articles of clothing and ornament, and the name and idea were adopted from those systems into the English law. By the common law all of a wife's personal property belonged absolutely to the husband and he could dispose of them at his discretion, and her paraphernalia were no exception to the rule, but on his death the wife could hold the paraphernalia against the personal representatives and legatees, though not as against creditors. The husband could not dispose of her paraphernalia by will.

No exact list of articles which may be included under the term "paraphernalia" can be given, as the rules vary in different jurisdictions. In general it may be said that to be classed as such the clothing and ornaments must be such as would ordinarily be possessed by a woman in her station in life, and that

jewels, etc., given by the husband in excess of his means will not be included, but will pass at his death to his personal representatives. See HUSBAND AND WIFE, and consult references there given; also SEPARATE ESTATE.

PAR'APHRASE (Lat. *paraphrasis*, from Gk. *παράφρασις*, from *παράφραζειν*, *paraphrasein*, to repeat a statement in different words, from *παρά*, *para*, beside, beyond + *φράζειν*, *phrazein*, to say). In music, a free arrangement of a composition for some other instrument or instruments. Bülow's arrangement of *Tristan und Isolde* is merely a transcription, because he puts nothing into the piano score that Wagner has not written in the orchestral score. Liszt's arrangement of the Love Death is a paraphrase, because he uses rhythmic figures of his own invention. Also he begins with the motive of the Curse, which in Wagner's score does not precede the opening of the Death song. Liszt's transcriptions of the songs of Schubert, Schumann, and others are excellent examples of paraphrases. In literature, paraphrase is a restatement of a work, as a clearer rendering or free translation, or change from verse to prose.

PARAPHYSES, pār-ăf'i-sēz (from Gk. *παράφυσις*, *paraphysis*, offshoot, from *παράφειν*, *paraphyein*, to produce offshoots, from *παρά*, *para*, beside + *φύειν*, *phyein*, to grow). Outgrowths, usually filamentous in form, which are associated with reproductive organs, either sexual or asexual. Among the fungi paraphyses occur in connection with the spore-bearing organs in the formation of hymenial layers, as in *Asco-bolus*, black knot (*Spharia morbosa*), etc. The best-known use of the term, however, is in connection with the mosses, in which the groups of sex organs, especially antheridia, are often intermingled with hairlike paraphyses. See MUSCI.

PAR'APLE/GIA. See PARALYSIS.

PARAROSANILINE, pār-ă-rô-zăn'i-lîn. See COAL-TAR COLORS

PAR'ASANG (Lat. *parasangu*, from Gk. *παράσαγγος*, *parasanygēs*, from Pers. *farsang*, *parasang*). A lincal measure still used by the Persians and often alluded to by the Greeks. The estimate of its length given by Herodotus, Suidas, Hesychius, and Xenophon, and concurred in by modern travelers, is equivalent to about 30 Greek stadia, or 3½ English miles. Byzantine writers reckoned it 21 stadia; Strabo reckoned it at 30, 40, and even 60 stadia. Persian authorities are divided.

PARĀŚARA, pā-rī'shā-rā. A Hindu sage, reputed to be the author of some of the hymns of the Rig-Veda, where he is once mentioned (vii, 18, 21) as a friend of Indra. He is said to have been the son of Vasishtha, or, according to the more usual account, of Vasishtha's son, Sakti. The story runs that King Kalmashapada once met Sakti in a narrow path in a thicket and ordered him out of the way. The sage refused, whereat the King lashed him with his whip, and Sakti cursed him to become a rakshasa, or demon. In this transformation Kalmashapada killed and ate Sakti, together with the other sons of Vasishtha. Sakti, however, had left his wife, Adrishyanti, pregnant, and she gave birth to Parāśara, who was brought up by his grandfather. When he grew up and was informed how his father died he instituted a sacrifice for the destruction of all the rakshasas, but was dissuaded from its completion by Vasishtha and other sages. This legend is later expanded so that, as a reward for his for-

bearance, Parāśara is said to have been the compiler of the *Viṣṇu-purāṇa*. (See PURĀNA.) There is also attributed to him a law code, the *Parāśara-smṛti*, and a subpurana, the *Parāśara-purāṇa*, which, like some late works ascribed to Parāśara, may have been composed by historical personages bearing this name. The legendary Parāśara is said to have been the father of Vyasa (q.v.) by an intrigue with the Princess Satyawati.

PAR'ASELE'NÆ. See HALO.

PAR'ASITE (Lat. *parasitus*, from Gk. *παράσιτος*, one who eats at another's table, guest, parasite, from *παρά*, *para*, beside, beyond + *σιτος*, *sitos*, food), ANIMAL. Animals that feed on the fluids of other living animals that the latter have elaborated for their own use; also on the juices and even solid matters that they get while feeding in the interior of living plants. It is essential to the idea of parasitism that an injury is done to some other living organism within which, or fastened on to which, the parasite lives; and the organism that supports the parasite is called the host. Modes of life which are frequently confused with parasitism are symbiosis, a living together with marked mutual benefit, and commensalism, an association without particular advantage or injury to either party. The lines of distinction are, of course, rather vague and in the history of organic life one condition has doubtless been changed to another.

Parasites are either temporary or stationary. Temporary parasites are those that seek their host only occasionally or for a short time; they may have different individuals as hosts at different times, as in the case with the leech and bedbug. Stationary parasites are those whose parasitic life continues for a long time, perhaps as long as life, although not necessarily on the same host, e.g., the tapeworm, which during part of its life is a parasite of man and during another part of cattle. This regular alternation of hosts is rather common among the internal parasites, especially those of higher animals. Parasites may also be classified as ectoparasitic or endoparasitic. Ectoparasites live chiefly on the skin and are either temporary, as in the case of the mosquito, or stationary, as in the case of the itch mite. Endoparasites live chiefly in the alimentary tract or some other intestinal organ and are stationary.

Origin of Parasitic Life. A knowledge of this subject can best be gained by a study of certain groups where all gradations occur from free-living to parasitic forms. The first example may be taken from the group Copepoda. Many of these small crustacea swim free in the sea and in ponds. They feed on all sorts of organic débris. One genus, *Argulus*, travels about on the surface of the bodies of fish and feeds on their slime. Another genus, *Caligus*, has taken a further step; it has migrated under the gill cover of a fish and has attached itself to the gills, receiving food from the blood flowing through them. It is doubtless harmful; it is a true external parasite. Finally, other Copepoda, e.g., *Lernæonema*, have penetrated between the scales and are found embedded deep in the muscles of menhaden and other marine fishes, living entirely on the juices elaborated by them and typifying a complete internal parasite. We see in this case how living on waste organic matter passes by easy gradations to life on and in living organisms.

The nematode worms are chiefly parasitic.

TABLE OF PRINCIPAL PARASITIC ANIMALS

GROUP	Species	Host	Remarks
PROTOZOA			
<i>Rhizopoda</i>	Some Amœbæ are parasitic.	Alimentary tract of man, mammals, insects	Behavior in the body like pathogenic bacteria. Example: malaria.
<i>Sporozoa</i> . . .	All are parasitic.		
<i>Infusoria</i> . . .	Numerous parasitic forms, e.g. Balantidium coli. Trichodinæ. Opalina. Holophyra multihilis Acanthamoeba. Anoplophrya.	Colon of man On gills and gill cavity of frog. Bladder and gut of frog Surface of fish. Mantle cavity of mussels Intestine of various marine invertebrates.	
PORIFERA . . (Sponges)	No true parasites		Cliona bores in shells of lamellibranchs.
CeLENTERATA .	A very few species. Polypodium hydriforme parasitic at one stage Cunina, a medusa Edwardsia, an actinian Pennatodiscus socialis. Gastrea, a ctenophore	Immature ova of sturgeon (Ussow). In other medusa. In Ctenophora On Rhizostoma (Monticelli, 1898). In Salpa.	
SCOLECIDA			
<i>Turbellaria</i> . .	A few Rhabdocœla Graffilla muricicola Fecampia erythrocephala All parasitic, two cases: 1. Only one host, young like adult, ectoparasites 2 Two hosts, endoparasites.	In kidney of the gastropod Murex. In gut of crab (Carcinus mænas).	Called monogenetic. Called digenetic.
<i>Trematoda</i> (Liver flukes)		On or in gut and bladder of aquatic animals. The asexual generation in Mollusca, the sexual, usually in gut of some vertebrate	
<i>Cestoda</i> (Tapeworms)	All parasitic, with or without alternation of generation.	Adults in various vertebrates, young stages also in invertebrates.	Two hosts required for complete development.
<i>Nematoda</i> . (Roundworms)	Mostly parasitic	Plants and animals, chiefly vertebrates.	Complicated life history, frequently with alternation of generations.
<i>Acanthocephala</i>	Four genera, all parasites.	Rarely in man; the young live chiefly in arthropods, the adults in vertebrates, especially fish intestines	
<i>Nemertinea</i> <i>Rotifera</i>	Rarely parasitic Malacobdella. Various species, order Ploima Order Sisonacea	In lamellibranchs. On or in fresh-water Oligochaeta. On the crustacean Nebalia	Marine, form much modified.
POLYZOA . .	None parasitic.		
MOLLUSCA . .			
<i>Gastropoda</i>	Eulima, Stylifer, Thyca Entoconcha mirabilis } Entocholax, Entovalva. } Sistrum.	Holothuria, starfishes, echinoids. Inside of Synaptidæ (Holothuroidea).	Embedded in skin, often forming tumors. Attached to blood vessels or muscles.
ECHINODERMATA	No parasitic species.	Certain corals	
ANNELIDA			
<i>Chaetopoda</i> (Sandworms)	Labrorostratus and Hæmato- cleptes (Eunioideæ). Some species of Polynoe } Species of Mysostomidæ } Most species are ectoparasites	In the body cavity of other chaetopods. In other invertebrates, as erinoids, on which galls are formed Mollusca, vertebrates	Temporary parasites, some leeches are carnivorous.
<i>Hirudinea</i> . . . (Leeches)			
CRUSTACEA .	Many Copepoda, e.g. Argulus Caligus. Lernaonema Some Cirripedia, especially Sacculina A few Amphipoda, e.g.: Cyamus. Hyperia. Many Isopoda, e.g. Anceus. Bopyridæ Cymothoidæ	Surface of fishes. On gills of fishes. In flesh of fishes Crabs, beneath abdomen. Skin of whales In the jelly of large medusa. On the fish Cottus On the gills of Crustacea. On fishes	Reduced to mere sacs.
INSECTA . . . (Insects)	Many plant parasites Certain groups of animal parasites, e.g. Mallophaga (bird-lice). } Pediculidæ (lice). } Membranacei (bedbugs). Strepsiptera. Aphaniptera (fleas) Pupipara (sheep lice) Culicidæ (mosquitoes) and many other Diptera Ichneumon flies.	Birds and mammals Warm-blooded vertebrates Hymenoptera and other insects Birds and mammals Birds, mammals, and bees Warm-blooded vertebrates Immature stages of other insects.	Ectoparasites, on feathers and hairs Temporary ectoparasites. Ectoparasites. Stationary ectoparasites. Ectoparasites. Active in the larval stage.
ARACHNIDA (Spiders, etc.)	Many parasites among Acarina (mites); Ixodoidea, ticks, Hydrachnoidea, water mites; Gamasoidea, includes poultry mite; Sarcopitoidea, itch and mange mites; and others.	Chiefly vertebrates, but also insects and other invertebrates.	A greatly modified arthropod.
VERTEBRATA .	Myxiniidæ (hagfishes).	Bore into the body cavity of fishes	

Some of the Anguillulidæ, or vinegar eels, however, live in organic fluids. The Ascaridæ, or stomach worms, live for the most part in the organic fluid contents of the intestine, which they still have to digest somewhat, so that they are on the line between messmates (see COMMENSALISM) and true parasites. They are, however, in great danger of being indubitable parasites, and this is the fate that befalls some of their kindred, e.g., *Trichina spiralis*. (See TRICHINA.) *Anguillula*, *Ascaris*, and *Trachina* show how parasitism has arisen in a group that originally had come to live on organic fluids, and especially how those animals that live on the surface of other animals, devouring their excretions (or waste fluids), will easily come to penetrate the flesh, devouring the vital secretions (or functional fluids). They will pass from scavengers to parasites.

The question why animals which are in a position to become parasites often do become parasites is not difficult to answer. Parasitic life brings great advantages to the parasite. First, it affords an abundant food supply; second, it diminishes the chance of direct attack from other organisms. The great disadvantage of abject parasitism is this, that the parasite is restricted in its environment, and, since the body that it inhabits is mortal, it must make special provision for the continuation of the species. In mammals the capacity of infecting the embryo while attached to the mother would be of great service in insuring this continuity, and a certain threadworm of the dog (*Flava immitis*) has been found to be transmissible from parent to fetus, as seems to occur in few species. Most parasites depend either upon the flesh of the host being eaten by a second host, or else the young are discharged, encapsuled (to protect them from desiccation or other untoward conditions), and take their chances of being picked up by a suitable host. To increase the chances of the continuity of life from one individual to the next, the fertility of parasites has become extraordinary. Indeed, in the group of copepods, where the embryos are carried in external pouches, one may see how the embryo pouches become larger as the parasitism becomes more complete. Van Beneden states that a single nematode produces 60,000,000 ova. The rich food supply of the parent makes this great fertility possible. In extreme cases the parasite is little more than an egg sac. To increase the fertility still more, fission, in the case of cestodes at least, has been added.

The adaptations in structures of parasites are striking. First, temporary parasites must move over the body of their hosts or go from one host to another. Hence (1) sense organs are developed to direct them in their migrations, and they are provided with locomotor apparatus, e.g., the springing legs of the flea; (2) stationary parasites gain apparatus for holding on, as suckers in cestodes and nematodes, and hooks in mites and copepods. Certain cestodes have both suckers and hooks; in still other cases, as in the degenerate cirriped *Saculina*, roots or holdfasts are developed, which also serve as imbibitory tubes; (3) endoparasites lose their locomotor organs, for large legs would be a disadvantage to burrowing parasites, such as *Demodex*, among mites, or unnecessary, as in the copepod *Caligus*; (4) endoparasites lose also their sense organs, because no longer useful, as is the case in parasitic Copepoda; (5) the alimentary tract

becomes degenerate in extreme forms, because food is gained by osmosis through the body wall (e.g., cestodes). In less extreme cases the alimentary tract is simplified on account of the absence of necessity for digestive apparatus.

Economic Considerations. The number of animal parasites harbored by one host may be enormous. Thus, in a young horse Krause found 500 *Ascaris*, 190 *Oxyuris*, several millions of *Strongylus*, 214 *Sclerostomum*, 287 *Filaria*, 69 adult and 9 immature *Tænia*. The destruction wrought by these parasites is sometimes very great. It is estimated that half a million pullets die yearly in England from gapes, caused by a threadworm (*Syngamus trachealis*). England in 1880 was estimated to be losing about 1,000,000 sheep annually from liver flukes. Fortunately the United States has been visited by no such scourges, but scores of cattle regularly die of the liver fluke in this country. The United States Bureau of Animal Industry makes official investigations into epidemics of parasites among the higher animals.

Although certain parasites are very injurious to man and his living possessions, others are among man's best friends. The common and injurious tussock moth (*Hemerocampa leucostigma*) is the prey of more than 20 different kinds of insects, chiefly Hymenoptera and Diptera, whose larvæ live in the immature tussock moth. Frequently as many as 90 per cent of the pest's larvæ and pupæ die as a result of these enemies. The complicated nature of parasitism is illustrated by the fact that these parasites also have parasites, called hyperparasites, enemies of man because they lessen the effectiveness of the primary parasites. However, a new set of parasitic friends come in, the tertiary parasites, which prey upon the hyperparasites. The matter seems to end there and does not go on "ad infinitum," as the familiar rhyme about the fleas states.

Artificial methods of controlling brown-tail and gypsy moths (see GYPSY MOTHS) in New England failed, and the government has introduced from Europe parasites of these moths with fair prospects of success. The ladybird beetles, although predacious rather than parasitic, confine their attentions largely to scale insects and plant lice. The citrus industry of California was saved from destruction by the Australian cottony cushion scale (*Icerya purchasi*) through the introduction of an Australian ladybird beetle, *Vedalia cardinalis*. Practically all the important insect pests of the United States are insects which have been introduced from foreign lands. They have become pests because their parasites have not been introduced also. Many of the native insects are potentially very injurious, but they are kept in check by their parasites.

mense group of fungi must always be either a saprophyte (q.v.) or a parasite, and some entire groups have adopted the latter habit, the most disastrous of the plant diseases being due to fungus parasites. The potato rot and grape downy mildew are caused by members of the Peronosporales. (See PHYCOMYCETES.)

FIG 1 DODDER (*Cuscuta*) PARASITIC ON A HOP STEM

The structures developed by many of these parasites to adjust themselves to their hosts are remarkable and lead to some very complex life histories. A life of parasitism appears to result in sexual degeneration (see FUNGI), so that, associated with remarkable specialization of vegetative organs, there is apparently in a number of groups the entire loss of sexuality. There are also some remarkable parasites among the flowering plants, the dodder (Fig 1) being an extreme example of complete dependence upon its host, the root disappearing, the leaves being mere scales, and the flowers much reduced. Other plants have well-developed green leaves and yet always grow with their roots or other parts connected with some host which supplies certain of their wants. Among these may be mentioned the mistletoe (*Viscum*), *Euphrasia*, and *Pedicularis*, the first named probably depending upon its host for almost all the water that comes to it. Parasites establish relations with their hosts generally by sucker-like structures, called haustoria (q.v.), which in many of the fungi are special branches which pierce the cell walls (Fig. 2). See also SYMBIOSIS.

FIG 2 DIAGRAM OF FUNGUS PARASITIC IN THE TISSUE OF THE HOST PLANT AND FORMING SPORES ABOVE THE SURFACE

PARASITIC DISEASES. An important subdivision in the classification of disease (See NOSOLOGY) In these diseases certain morbid conditions are induced by the presence and vital activities of various low forms of animal or vegetable life which have found lodgment and subsistence in some tissue or organ or upon some surface of the body of man or animals. Even plants are not exempt from disorders of this nature. See PARASITE, PLANT

The vegetable microorganisms which cause disease are far more numerous and important than the animal. They may be divided into three classes: (1) the *Blastomycetes*, or yeast fungi; (2) the *Hyphomycetes*, or molds; and (3) the *Schizomycetes*, or bacteria.

1. The yeasts are important principally as causes of fermentation. One member of the family, however, is pathogenic, and produces swellings which break down into abscesses in man and horses. It is called blastomycosis (q.v.). Closely allied to this is thrush (q.v.), a variety of stomatitis caused by the *Oidium albicans*. By some writers thrush is classed among the affections due to molds. Yeasts are common in the stomach, being introduced with the food, and are found in diabetic urine.

2. The pathogenic molds are found upon the surface of the body, since they require free oxygen for their growth. They are responsible for many skin diseases. Favus (q.v.) is caused by the *Anchorion schenleum*. Pityriasis versicolor, also called chloasma, is caused by the *Microsporon furfur*. Actinomycosis (q.v.) is due to infection by the ray fungus (*Actinomyces*). Madura foot is a serious disease occurring in the feet of natives of India, was described in 1874 by Carter, and is due to the *Streptothrix mycetoma*. Erythrasma is caused by the *Microsporon minutissimum*. Ootomycosis and pharyngomycosis are due to the *Aspergillus fungus*, an organism which also penetrates the lungs. The *Leptothrix buccalis* is found on the inner side of the cheeks and is believed to induce caries. Nocardiosis is a name applied to a class of infections characterized by the presence of certain branched organisms, some of them resembling molds. The lesions are mostly found in the respiratory tract and are of interest from the fact that they may be easily mistaken for those of tuberculosis.

3. The Schizomycetes, or bacteria, are by far the most important and interesting of the vegetable parasites. They penetrate every tissue of the body and are known to be the cause of most of the specific febrile diseases and are suspected to be the cause of others. The study of these organisms has almost reached the dignity of a separate science. See BACTERIA.

Animal Parasites. These may be classified as insects, worms, and protozoa. The rôle played in the causation of the disease by insects is discussed under INSECTS, PROPAGATION OF DISEASE BY. Among the true parasitic insects are fleas, lice, and ticks. Jumping fleas, *Pulex*, are of interest as the carriers of bubonic plague; they also act as an intermediate host for certain tapeworms, and their larvæ may become pseudo parasites in man. The burrowing flea (jigger, chigger, or chigoe), *Sarcophylla penetrans*, penetrates the skin and causes painful pustules. Lice are not only parasites, but they often transmit several diseases, among which the most important is typhus fever. Myiasis (q.v.) consists in an infection from the larva of flies. Of these the grub of the screw worm, *Comptosia macellaria*, deposits its eggs in open wounds or in the nostrils. Flesh-fly larvæ, *Sarcophaga*, are found in wounds, in the ear canals, in the intestine and anus. A number of other fly larvæ are described as attacking man. They all produce serious and often fatal symptoms.

Worms form a large and important class of animal parasites, but only a few can be mentioned here. The trematodes or flukes, infection

by which is termed distomatosis, inhabit the lungs, liver, intestine, and veins. These infections are most plentiful in the tropics, but are found in all parts of the world. Bilharziosis is one of the most common forms and consists in invasion of the veins by the parasite *Schistosomum hæmatolum*, described by Bilharz in 1852. There is also an Asiatic blood fluke, *Schistosomum japonicum*, discovered by Katsurada in 1904 (See BILHARZIA DISEASE). Of the intestinal parasites teniasis, or tapeworm infection, occurs in many forms, over 300 species are described. In their larval stage they are the cause of hydatid (q.v.) disease and cysticercosis. Roundworm infections include hookworm disease (q.v.)—the common large intestinal roundworm, *Acaris lumbricoides*, and the pinworm, *Oxyuris vermicularis*. The most important muscle roundworm is the *Trichinella spiralis*, which obtains entrance into the body through the eating of raw or rare pork. The disease is called trichinosis or trichiniasis (q.v.). Filariasis is due to a threadlike worm, *Filaria sanguinis hominis*, or, more exactly, *Filaria bancrofti*. Elephantiasis (q.v.) is caused when the parasite invades the lymph channels and obstructs their flow. *Filaria loa* is the cause of an interesting disease called Calabar swelling.

Arthropods include the *Icarus*, to which species belong the itch mite, *Acarus scabiei* (see SCABIES), and the comedo mite, *Demodex folliculorum*, both of which are described under their proper titles. the harvest mite, *Leptus americanus*, also known as the red bug, or harvest bug, attacks man, generally in the harvest season, and burrows under the skin. Tongue-worm infection, and a number of other forms of acariasis, are very rare.

Protozoa are unicellular organisms, of which thousands of species have been named and described by zoologists. They are divided into four great classes, viz., sarcodina, mastigophora, infusoria, and sporozoa, the latter are always parasitic and cause a number of diseases in man, among which are malaria (q.v.), blackwater fever, and sleeping sickness (q.v.). The last is a form of trypanosomiasis. Trypanosomes are described as sinuous, wormlike organisms, consisting of a single cell and terminating in a long flagellum. Finally, we may mention the *Amæba*, to which a form of dysentery (q.v.) is due, and *Spirochæta pallida*, or *Treponema pallidum*, the specific organism of syphilis (q.v.).

Neumann, *Treatise on the Parasites and Parasitic Diseases of the Domesticated Animals*, translated by Fleming (new ed., New York, 1910); P. E. Archard, *Microscopy, Bacteriology, and Human Parasitology* (2d ed., Philadelphia, 1912); B. F. Kaupp, *Animal Parasites and Parasitic Diseases* (new ed., Chicago, 1914); A. E. Shipley, *The Minor Horrors of War* (London, 1915); W. B. Herms, *Medical Entomology, including its Application to Public Health* (New York, 1915).

PARASOL (Fr. *parasol*, lt. *parasole*, from *para-*, parry, and *sol*, sun). A small umbrella made to use as a sunshade, usually with ornamented handle, and with silk covering of gay color, which is sometimes fringed, or trimmed with lace and embroidery. In the eighteenth century in Europe the parasol became peculiarly an article of feminine costume, having previously been used by both men and

women. The use of parasols in Italy appears to have been continuous from ancient to modern times, and was adopted by France in the sixteenth century and to a less extent by England in the seventeenth. The Chinese and the Japanese, men as well as women, use parasols of bamboo covered with paper printed in bright colors with pictures as well as purely decorative motifs. Large and elaborate parasols have from time immemorial been a mark of honor and official dignity in the Orient. We find them pictured on the walls of ancient Egypt and Assyria. In India in 1877 when the then Prince of Wales made his famous tour, he was compelled, in order to properly impress the natives, to ride upon an elephant and have over his head a parasol with frame of gold, and with covering stitched thick with precious jewels. See COSTUME and consult Octave Uzanne, *L'Ombrelle* (Paris, 1883).

PARASOL FUNGUS. See MUSHROOM.

PARATHYROID (pär'a-thí'roid) GLANDS. See ORGANOTHERAPY, SECRETIONS, INTERNAL.

PARAUÇU. See SAKI.

PARAY-LE-MONIAL, pa'râ'-le-mô'nyal'. A town in the Department of Saône-et-Loire, France, on the Bourbonne, 32 miles northwest of Macon (Map. France, N, K 6). Its Benedictine abbey, founded in 973, contains the tomb of Marguerite Marie Alacoque (q.v.). The revelations said to have been made to her greatly stimulated the devotion to the Sacred Heart of Jesus (See SACRED HEART OF JESUS, FEAST OF THE). Paray-le-Monial has consequently become a popular pilgrimage centre, and large numbers from Europe and America visit it annually. Pop., 1901, 4362, 1911, 4814. For an account of the apparitions, consult Bougand, *Histoire de la bienheureuse Marguerite Marie* (Paris, 1894).

PARCÆ (Lat., Fates, connected with *parere*, to bring forth, hence originally *Parca*, a goddess of childbirth, later associated by popular etymology with *para*, part, identified with the Gk. *Moira*, *Moiræ*, and then tripled into three *Parcæ* to correspond to the three *Moipai*, or Fates). The name given by the Roman poets to the Greek *Moiræ*, or goddesses of fate. They have no place in Roman worship, though the name appears in Gallic territory applied to Celtic divinities, who are also called *Fati* (masculine) or *Fatæ* (feminine). In the Roman poets they play an important part as spinners of the thread of life. Among the Greeks the conception of the *Moiræ* is somewhat different. The name in the singular denotes the portion of life allotted to each man at his birth, with the inevitable death at the appointed moment. In Homer *Moiræ* is the goddess who allots this portion to man, though it is often hard to tell whether the word is a proper name or a common noun, destiny. Here we find, however, *Moiræ* or *Aisa* as a spinner of a thread of destiny for every man at his birth, in one place she is associated with the *Klôthes*, or spinners, who work under her direction. From this idea of the spinner of the thread of life developed the conception of two or three goddesses who begin, control, and end this thread, but the *Moiræ* are named only once in Homer, and their development in the cult is of a later date. In Hesiod they appear as the three daughters of Zeus and Themis—*Clotho*, the spinner, *Lachesis*, the assigner of the lot, *Atropos*, the inflexible, who cuts the thread. They were worshipped in

Athens, Corinth, Sicyon, Sparta, Thebes, and elsewhere. They are gloomy, invisible goddesses, who know the future and at times reveal it. Their cult was in some places without images, and their offerings were those appropriate to chthonic divinities. To them honors were paid not only in connection with birth and death, but at any important epoch in human life. To a later period belongs the close division of functions between the three sisters, which does not appear in art till Roman times. In the earlier art they are not distinguished as individuals, but are represented only as fully draped female figures of youthful dignity. The so-called Fates of the Parthenon pediment are not certainly identified. Later Clotho is regularly indicated by the spindle, Lachesis by a globe, on which she traces the fate of man, or by little rods, from which she draws his lot, and Atropos by a roll or tablet, in which she records man's fate, or the sundial, to which she points. The relation of the Moiræ to the gods is not always clearly defined. In Homer the decree of Moiræ is in accord with the will of Zeus and once determined cannot be altered. Later writers, while keeping the connection with Zeus, seem at times to regard the Moiræ as binding even the gods. Later philosophical speculation naturally gave much attention to the Fates, and even in popular belief they held a high place among the gods. Consult C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

PAR/CENARY (OF. *parcenerie*, from *par-cener*, partner, from ML. *partitionarius*, having a share, from Lat. *partitio*, share, from *pars*, portion). At common law, the state of two or more persons, called *parceners*, who hold title to lands that have descended to them as equal heirs, so that though the estate is undivided each has a right to an equal share of it, without benefit of survivorship. See COPARCENARY; TENANCY IN COMMON.

PARC ET DE GOMBERVILLE, SIEUR. See GOMBERVILLE, MARIN LE ROY, SIEUR DU PARC ET DE.

PARCHÉ, pâr'shâ'. One of the small, beautiful coral fishes or butterfly fishes (*Chatodon capistratus*) common in West Indian waters. The name "parché" is sometimes applied to all the butterfly fishes. See PLATE OF CORAL FISH.

PARCHIM, or PARCHEM, pâr'kim. A town in the Grand Duchy of Mecklenburg-Schwerin, Germany, situated on the Elbe, 20 miles south-east of Schwerin (Map: Germany, D 2). It has a monument to Field Marshal Von Moltke, a native of the town. It manufactures cloth, chicory, celluloid, paper, tobacco, cigars, leather, and dairy products. Parchim is one of the richest cities of Mecklenburg, owning a good deal of the surrounding land. Pop., 1900, 10,242; 1910, 10,608, chiefly Protestants.

PARCH'MENT (OF., Fr. *parchemin*, from Lat. *pergamina*, *pergamenæ*, from Gk. *περγαμινή*, parchment, from *Περγαμηνός*, *Pergaménos*, relating to Pergamus, from *Πέργαμος*, *Pergamos*, *Πέργαμον*, *Pergamon*, a city of Mysia in Asia Minor, whence parchment was originally brought) and VELLUM (from OF. *velin*, Fr. *vélin*, vellum, from ML. *vitulinus*, relating to a calf, from Lat. *vitulus*, calf; connected with Gk. *ιταλός*, *italos*, Skt. *vatsa*, calf, from *vatsa*, Gk. *ἔτος*, *etos*, year). One of the oldest of writing materials, known at least as early as 500 B.C. Herodotus speaks of books written upon skins.

while Pliny, without good grounds, places the invention as late as 196 B.C., stating that it was made at Pergamum in the reign of Eumenes II, in consequence of Ptolemy of Egypt having prohibited the exportation of papyrus. Possibly the Pergamian invention was an improvement in the preparation of skins, which had certainly been used centuries before. The manufacture rose to great importance in Rome about the first century B.C., and its use spread over all Europe and retained its preëminence until the invention of paper from rags.

Parchment is prepared from the skins of sheep and goats; vellum from that of calves, kids, and dead-born lambs; the thick, common kinds, for drums, tambourines, battledores, etc., from those of old goats and in northern Europe from wolves; and a peculiar kind is made from asses' skins, the surface of which is enameled. It is used for tablets, as black-lead writing can be readily removed from it by moisture. The method of making parchment is at first the same as in dressing skins for leather. The skins are limed in the lime pit until the hair is easily removed. They are then stretched tightly and equally upon a square wooden frame called a herse. The flesh side is dressed as in currying, until a perfectly smooth surface is obtained. It is next ground by rubbing over it a flat piece of pumice stone, previously dressing the flesh side only with powdered chalk, and slaked lime sprinkled over it. It is next allowed to dry, still tightly stretched on the frame. The drying process is an important one and must be rather slowly carried on, for which purpose it must be in the shade. Sometimes these processes have to be repeated several times in order to insure an excellent quality, and much depends upon the skill with which the pumice stone is used and also upon the fineness of the pumice itself. Vellum is prepared with the finest pumice. When quite dried the lime and chalk are removed by rubbing with a soft lambskin with the wool on. The annual imports of parchment and vellum into the United States usually range in value from \$50,000 to \$75,000; in 1913 they amounted to \$59,466.

PARCHMENT, VEGETABLE, or PARCHMENT PAPER. When pure unsized paper is dipped into a cooled mixture of one part of water and two parts of sulphuric acid and then washed carefully with water and very dilute ammonia until every trace of acid is removed, and is then dried under pressure, a product is obtained in which the cellulose of the paper has been partly changed into amyloid or hydrocellulose, which forms a gelatinous coating over the swollen fibres and acts as a sizing. The parchment-like paper produced is translucent. A long-fibred unfilled paper, either cotton or linen, is preferred for the manufacture of this parchment. Paper shrinks 30 per cent in the process and increases three to four fold in strength, is impervious to liquids and gases, and does not mold. It absorbs colors and printing inks which cannot be erased. A good parchment paper will resist repeated boilings in water.

As parchment paper is liable to become highly brittle on standing, it is customary to treat it with dilute solutions of calcium or magnesium chlorides or glycerol to overcome this difficulty.

PARDESSUS, pâr'de-sû', JEAN MARIE (1772-1853). A French jurist and publicist, born at Blois, Aug. 11, 1772. He was educated to the law and early became distinguished for learning

and eloquence. He was made associate judge in his native city at 30 and mayor of Blois in 1805. His *Traité des servitudes*, published in 1806, established his reputation as a jurist and a writer of force and eloquence. It quickly reached eight editions. In 1809 he published *Traité du contrat et des lettres de change*, subsequently published under the title of *Cours de droit commercial*, which was considered the masterpiece of its time. His works on maritime law, *Collection des lois maritimes antérieures au XVIIIème siècle* (6 vols., 1828-45), *Us et coutumes de la mer* (1847), and his *Collection des ordonnances des rois de France*, were equally esteemed. In 1810 a professorship of commercial law was created for him in the law department of the Collège de France, where his lectures were notable. In 1815-16 and again in 1824-27 he was a member of the Chamber of Deputies. After the Revolution of 1830 he retired from public life. He died at Blois, May 26, 1853.

PARDO, pãr'dô, MANUEL (1834-78). A Peruvian statesman, born in Lima. He was educated in Santiago de Chile and in Europe, studied law and political economy, and received a government position in the Lima Bureau of Statistics in 1853. Five years afterward he was elected to the board of charities and, forgetful of self, did much to check the yellow-fever epidemic of 1867. In 1862 he founded the first bank in Lima. He entered the cabinet of President Mariano Prado in 1865, was President of the Tribunal of Commerce in 1868, mayor of Lima (1869), and President of Peru in 1872-76. He was the first civilian to hold that position, and his decrees in the interests of science, literature, and the public peace caused the people to remember him as a good ruler. He was afterwards President of the Senate. Probably at the instigation of officers who bore Pardo ill will for having reduced the army, he was assassinated in front of the Hall of Congress by a sergeant.

PARDO BAZÁN, bà-thân', EMILIA, COUNTESS OF (1851-). A naturalistic Spanish novelist and critic. She was born at Coruña, Sept. 16, 1851. After her marriage to Señor D. José Quiroga, in 1868, she went to Madrid, where she witnessed the revolutionary outbreak of that year. In 1876 she won a prize offered by the municipality of Oviedo for an essay on the Benedictine monk Benito Jerónimo Feijóo, well known in eighteenth-century Spanish literature. A journey through France, England, and Italy followed. Later Señora Pardo Bazán settled at Madrid, where she founded a review, the *Nuevo Teatro Crítico*. Her debt to Zola, whose determinism, however, she condemns, is most evident in her two strongest novels, *Los pazos de Ulloa* (1886) and *La madre naturaleza* (1887), in which she describes the decay of an aristocratic family. But her realism is Spanish rather than French, and she seeks a broad outlook on life. In *El cisne de Vilamorta* (1885) a romantic ending contradicts her naturalistic theories. Her descriptions of the life in her native Galicia are successful. Of her novels may be mentioned, besides the three noted above: *Pascual López*; *Un viaje de novios*; *La tribuna*; *La dama joven*; *Insolación*; *Morriña*; *Una cristiana*; *La prueba*; *La piedra angular*; and of her essays and critical treatises, *San Francisco de Asís*; *De mi tierra* (1888); *El Padre Luis Coloma*; *Pedro Antonio de Alarcón*; *La revolución y la novela en Rusia* (1887); *La cuestión palpitante* (4th ed., 1891), rhetorical

essays dealing with realism and naturalism in the modern novel; *Polémicas y estudios literarios*, a supplement to the matter contained in *La cuestión palpitante*, embracing also the account of her quarrel with the novelist Pereda (q.v.), and a review of some of the works of Galdós, etc. Her critical work, as well as her fiction, is of importance. She received her title of Countess in 1908 and in 1910 was appointed a member of the Council of Public Instruction. In 1891 her works had begun to appear in a uniform edition, as *Obras completas*. The first play that she wrote, *Verdad*, was published in 1905. Subsequent writings were: *Misterio* (1911), a novel; *Belcebú* (1912); *Cuentos Trágicos* (1913).

PARDOE, pãr'dô, JULIA (1806-62). An English author, born at Beverley, Yorkshire. Her father was Major Thomas Pardoe. She traveled in Portugal, was with her father for a time at Constantinople, and visited Hungary. Since Lady Mary Montagu, no woman had ever acquired so close a knowledge of Turkish life and manners, and out of this knowledge came, notably, *The City of the Sultan and Domestic Manners of the Turks* (2 vols., 1837). In 1859 she was granted a civil-list pension of £100. She died in London, Nov. 26, 1862. In her fourteenth year Miss Pardoe published a volume of verse, which went into a second edition. Afterward she became a popular novelist, writing *Lord Morcar of Hereward* (1829), *The Hungarian Castle* (1842), etc. Her miscellaneous works are descriptions of the lands and peoples she had visited and graceful essays on French history. Among them are: *Traits and Traditions of Portugal* (1833); *Louis XIV and the Court of France* (1847); *The Court and Reign of Francis I* (1849; reprinted with memoir 1887); *Life and Memoirs of Marie de' Medici* (1852); *The Romance of the Harem* (1839, 1857); *The Beauties of the Bosphorus* (1839); *The City of the Magyar* (1840); *Episodes of French History during the Consulate and the First Empire* (1859).

PARDON (OF, Fr. *pardon*, from ML. *perdonum*, pardon, from *perdonare*, to grant, from Lat. *per*, through + *donare*, to give, from *donum*, gift). An act of grace, exercised by a competent authority, remitting the penalty imposed by law upon a person who is either guilty or accused of a crime or offense against the state. The earliest records of governments contain instances of the exercise of such a power by the sovereign authority, relieving an offender from the consequences of a violation of a tribal rule or later of a national law. The main reasons for vesting the chief executives of modern nations with the wide discretion which they exercise in this regard are to prevent injustice because of the fallibility of human laws, which sometimes work hardship in individual cases, although they may be salutary on the whole; the possibility that a person may be unjustly accused and convicted, which may not be discovered until long afterward; to make it possible for the supreme authority to release persons convicted and sentenced under harsh and oppressive laws, especially political offenders convicted in a time of great public excitement and discord; to enable the chief executive to reward in this manner repentance and good conduct in prison, where he is satisfied that a thorough reform has been effected, and justice satisfied; and, generally, for reasons of state.

In England this power has always been vested in the King and in early times seems to have been shared to a certain extent by the Lords of the Marches. In 1536 a statute was enacted (27 Hen. VIII, c. 24) restricting the right to the King and prohibiting him from delegating it to any subject within the realm. At present the crown exercises its prerogative upon the advice of the Secretary of State for the Home Department. Parliament has from time to time imposed certain restrictions on the exercise of the pardoning power. A pardon cannot be pleaded as a defense to an impeachment by the House of Commons. By the Habeas Corpus Act of 1679 the crown cannot pardon the offense of sending a person to prison without the realm. Where the pardon of an offense will work an injury against an innocent person, it will only be operative as far as the culprit's liability to punishment by the crown is concerned and will not affect his civil liability to a person injured by his crime.

In the United States the power to pardon offenses against the national government is vested, by the Constitution, in the President. His power is absolute, except as to impeachments of public officers, and rests entirely in his discretion, not being subject to legislative control. Perhaps the greatest number of pardons are granted to soldiers guilty of a breach of the military regulations, especially to volunteers who are unused to rigid military discipline. In most of the States the pardoning power is vested in the Governor alone. Several of the States require the concurrence of one branch of the Legislature, and in a few boards of pardons have been established, of which the Governor is usually a member *ex officio*. Applications for a pardon are usually presented in the form of petitions by the persons seeking pardon, supported by letters and affidavits of responsible people setting forth the extenuating circumstances of the case, and the previous good character of the convicted person; and formal hearings on such applications are often held. The necessity for the exercise of this power is greatly lessened in some States by statutes allowing a graduated commutation of a term of imprisonment as a reward for repentance and good conduct in prison. Many penal statutes also allow wide discretion to the trial judge as to the sentence to be imposed, in the exercise of which he may consider extenuating circumstances, etc., just as a Governor would do on an application for a pardon. The system of releasing prisoners on parole (q.v.), and of suspending sentence of convicted persons, is also a development of the idea of pardon.

A pardon may be absolute or conditional. In the latter case it goes into effect or, as the case may be, ceases to have effect on the happening of the condition. Thus, a prisoner may be released on condition that he leaves the State forever. On violation of the condition the expirer may be again remanded to serve out his original term. A general pardon extended to political offenders, such as rebels, is usually called an act of amnesty (q.v.). A pardon is more sweeping in its effect than a reprieve, which only operates as a suspension of sentence. A full pardon effects a remission of the punishment and generally removes the legal disabilities which follow conviction, so that a person who is pardoned is, in law, as innocent as if he had never committed the crime, except that it does

not restore forfeited property or fines. In most American States, moreover, a pardon does not of itself operate to restore a person who has been convicted of an infamous crime to the rights of citizenship forfeited by him unless such restitution is expressly made by the pardoning power. In some States, where a final conviction of murder and sentence of death operate as an absolute divorce of husband and wife, the pardon of a convicted spouse does not operate to restore the marital relation. A pardon obtained by deception or fraud is void, and on discovery of this fact the convicted person may be again committed to serve out his term. Consult the authorities referred to under CONSTITUTIONAL LAW; CRIMINAL LAW.

PARDONER'S TALE, THE. In Chaucer's *Canterbury Tales*, the story of three rioters who pledge themselves to find and destroy Death, but conspire against each other, and die.

PARDOW, pär'dô, WILLIAM O'BRIEN (1847-1909). An American Jesuit priest, born in New York City. After graduating at St. Francis Xavier College in 1864, he continued his studies at Woodstock College and in France. He served as president of St. Francis Xavier in 1891 and as provincial superior of New York and Maryland in 1893, was curate of the church of St. Ignatius Loyola, New York, in 1901-03, lectured at the Jesuit Institution in 1903-06, and thereafter until his death was curate of the church of Gesu, Philadelphia. Farther Pardow was identified with the Modernist movement and was regarded by many as the greatest Catholic preacher in the United States.

PARDUBITZ, pär'du-bits. A town of Bohemia, Austria, situated at the confluence of the Chrudimka with the Elbe, 12 miles south of Königgrätz (Map: Austria-Hungary, D 1). It has an old palace (a former stronghold of the lords of Pernstein), several important churches, a large Rathaus, and a higher Realschule. Its manufactures comprise spirits, sugar, agricultural machinery, iron products, musical instruments, lumber, and flour. It is an important horse market. Pop., 1900, 17,029; 1910, 20,419, chiefly Roman Catholic Czechs.

PARÉ, pä'rä', AMBROISE (1517-90). A French surgeon, born at Laval, Department of Mayenne. He was apprenticed to a barber in Paris, studied anatomy and surgery, became an assistant at the Hôtel Dieu, and in 1536 entered the army as a surgeon. During the military operations in Italy he acquired a great reputation as a skillful surgeon. He introduced the practice of ligating arteries in bleeding wounds in place of the fashion which then prevailed of cauterizing them with boiling oil. Although to him we owe the use of trusses in hernia, the employment of massage, and other innovations, it is on the ligating of arteries that his fame as "the father of modern surgery" chiefly rests. On his return to Paris in 1539 he was received with distinction by the Royal College of Surgery and was subsequently made its president. War being renewed, he again entered active service, this time introducing the practice, after amputations, of using ligatures instead of cauterization with hot irons. Honors were showered upon him, even learned titles and degrees, though Paré was ignorant of Latin, then the *conditio sine qua non* of a liberal education. He became surgeon to Henry II, Francis II, Charles IX, and to Henry III. It has been stated that by order of the King he

was spared at the slaughter of the Huguenots in the night of St. Bartholomew.

Paré's writings have exercised a profound influence on the practice of surgery. He was the first surgeon to write (perforce) in his native tongue instead of in Latin. His best-known works are his treatise on gunshot wounds, *La manière de traiter les playes* (1552); on surgery, *Deux livres de la chirurgie* (1564) and *Deux livres de chirurgie* (1573); on the pest (1568); on monsters (1573); and against the use of mummies and unicorns in therapeutics, *Discours à scavoir, de la mummie, des venans, de la licorne, et de la peste* (1582). A complete edition of Paré's works, edited by Malgaigne, appeared at Paris in 1840-41. Besides this are eight Latin editions and more than 15 translations. Consult Stephen Paget, *Ambroise Paré and his Times* (New York, 1897); and the *Life* by Paulmier (Paris, 1884). See MEDICINE, HISTORY OF; and SURGERY, MILITARY.

PAREGORIC (Lat. *paregoricus*, from Gk. *παρηγορικός*, *parēgorikos*, soothing, from *πατήρ*, *patēr*, father, *parēgoros*, consoling, from *παρά*, *para*, beside + *ἀγορεύω*, *agoreúō*, to talk in assembly, from *ἀγορά*, *agorá*, assembly). The camphorated tincture of opium of the *United States Pharmacopæia*. An alcoholic solution of opium, benzoic acid, camphor, and oil of anise, every fluid ounce containing two grains each of opium, benzoic acid, and camphor, and two minims of oil of anise. This preparation is much used both by the profession and the public. It is an excellent remedy for the chronic winter cough of old people, the opium diminishing the bronchial secretion and the sensibility of the pulmonary mucous membrane, while the benzoic acid and oil of anise act as stimulating expectorants. The volatile oil and camphor render paregoric particularly useful in diarrhoea. The preparation is often improperly given to children by careless or ignorant parents to quiet them and relieve pains in the bowels. Children are peculiarly susceptible to opium, and much harm is done by its regular administration.

PA'REIASAURUS (Neo-Lat., from Gk. *παρεία*, *pareia*, cheek + *σαῦρος*, *sauros*, lizard). A remarkable fossil Cotylosauria, of which a few quite complete skeletons have been found in the Permian Karoo formation of South Africa. The animal was large, about 9 feet in length, of massive build, with very short stout limbs and a short tail. The skeleton presents a most peculiar squat appearance and in some respects suggests that of the turtles. There were a few rows of small dermal scales on the back.

PA'REIRA BRAVA, pá-rá-rá brí'vá (Portug., from Brazilian *pareira*, the native name, and Portug. *brava*, brave, strong). The root of *Chondrodendron tomentosum*, used to some extent medicinally as a diuretic, which for a century was supposed to be the root of *Cissampelos pareira*, but was identified by Hanbury in 1872. The plant is a tall, woody climber, a native of Brazil and Peru, belonging to the family Menispermaceæ. It has large, ovate-cordate, fine-nerved leaves, very small unisexual flowers, and purplish black, ovoid, one-seeded drupaceous fruits, resembling grapes. As it comes to market the root is in short, thick, dark-brown pieces, externally ridged and fissured transversely and irregularly furrowed longitudinally. It is nearly odorless and has a bitter taste. The stem is sometimes found mixed with the root, which it much resembles, but may be distinguished by

the pith. The roots of several other menispermaceous plants have been sold for *pareira brava*. There is a yellow *pareira brava* exported from Brazil in the form of flat twisted stems which has been thought to be obtained from *Aristolochia glaucescens*. It may be detected by the eccentric arrangement of its woody zones, which in the genuine are symmetrically concentric. See CISSAMPELOS.

PAREJA, pá-rá'há, JUAN DE (1606-70), called El Esclavo (the slave). A Spanish religious and portrait painter. He was born at Seville, the son of Moorish parents, and was the slave of Velazquez. He assisted his master in the studio, all the while secretly studying his art. By an artifice he succeeded in bringing one of his pictures to the attention of Philip IV, while he was visiting Velazquez's studio, who immediately set him free. He continued to serve Velazquez, though enrolled among his pupils, and after the latter's death he served his daughter. His paintings are quite in the manner of his master. The most notable are: "The Calling of St. Matthew," in the Prado Museum, Madrid; "Baptism of Christ," Huesca Museum; and the portrait of the architect Rates. Other works ascribed to him are in the galleries at St. Petersburg and Dulwich.

PARENCHYMA, pār-ēp'kí-má (Neo-Lat., from Gk. *παρέγχυμα*, tissues of the lungs, liver, kidneys, and spleen). A plant tissue composed of living (usually thin-walled) cells whose three dimensions are approximately equal. Sometimes the term is applied to elongate cells. Parenchyma represents the primitive, undifferentiated tissue of a plant, from which the other tissues have been derived. It is really the parent tissue. See HISTOLOGY.

PARENT, pá-rán', ETIENNE (1801-74). A Canadian journalist and philosopher. He was born at Beauport, Province of Quebec, and was educated at Quebec Seminary and at Nicolet College. Early recognition of his unusual abilities procured for him when 21 the editorship of an influential newspaper, *Le Canadien*. This position he held for three years. He afterward studied law, was called to the bar in 1828, but practiced his profession only a short time, having accepted the position of French translator, and subsequently librarian, to the Lower Canada Legislative Assembly. In 1831-42 he was again editor of *Le Canadien* and advocated responsible government and other reforms with such boldness that he was imprisoned in 1837-38. He was elected a member of the Canada Legislative Assembly in 1842, after Upper and Lower Canada were united in one province. In 1842-47 he was clerk of the Executive Council, then for 20 years Assistant Secretary for Lower Canada, and in 1867 became acting Assistant Secretary of State for Canada. Parent was probably the ablest writer on economic, religious, and political topics that French Canada has produced and did more than any other person to promote an intellectual revival in that province. In a series of public lectures, afterward printed in the *Payer Canadien*, he sought to enlighten his racial compatriots as to their true industrial and political interests, giving special attention to wage earners and popular education and appearing also as the philosophic defender of the Catholic religion as necessary to spiritualize social life. In the latter respect his attitude was liberal, though not to the point of openly breaking with the ecclesiastical au-

thorities. He published: *Du travail chez l'homme* (1847); *Importance de l'étude de l'économie politique* (1847); *L'Industrie considérée comme moyen de conserver notre nationalité* (1848); *Du prêtre et du spiritualisme dans leurs rapports avec la société* (1848); *De l'importance et des devoirs du commerce* (1852); *De l'intelligence dans ses rapports avec la société* (1852); *Considérations sur le sort des classes ouvrières* (1852). Consult Abbé Camille Roy, "French-Canadian Literature," in *Canada and its Provinces* (Toronto, 1913-14).

PARENT, SIMON NAPOLEON (1855-). A Canadian statesman, born at Beauport, Province of Quebec, and educated at Quebec Normal School and Laval University. He was called to the bar in 1881, practiced in Quebec, and became a leader in his profession. Parent was an alderman of Quebec City (1890-94) and mayor (1894-1905), a Liberal member of the Legislative Assembly (1890-1905), and Commissioner of Lands, Mines, and Forests (1897-1900) in the Marchand administration; and in 1900-05 Prime Minister of Quebec and also Minister of Lands, Mines, and Fisheries. In 1905-11 he served as chairman of the National Transcontinental Railway Commission.

PARENT AND CHILD. Under this head are usually treated the legal relations which exist between father or mother and children. The legal is to be distinguished from the natural relation, for two persons may be by the law of nature parent and child, while they are not legally so. Conversely, the legal relation may exist although there is no natural relation. Hence a radical distinction exists between natural, or illegitimate, and legitimate children, and their respective legal rights with relation to their parents are very different.

Early Law. While the legal relationship between mother and child has always been based on the fact of maternity, that between father and child was originally based, not on the fact of paternity, but on the husband's power over the child's mother. Marriage, as we find it at the dawn of European history, was the appropriation of the woman by the man; and as the husband's authority over his wife was originally not differentiated from other property rights, so the power of the father over children born of the wife was originally indistinguishable from ownership. Wife, children, slaves, and things were equally *in manu*, i.e., "in, or under, the hand," of the head of the house. The father had the power of life and death over the child as well as the right to sell it. The marriage of a daughter, which usually took on the form of a sale and which put her "in the hand" of her husband, of course carried her out of the father's power, and paternal authority over the son ended, among most of the Indo-European peoples, when the son established a household of his own. The lifelong paternal authority (*patria potestas*) of the Roman father seems to have been exceptional; it resulted from the Roman custom by which the son brought his wife into his father's house.

Of maternal authority over children, even when illegitimate, there is little trace in early law, because the woman was regularly herself "in the hand" either of father or of husband or kinsman during her whole life. In early Frisian law, however, the mother had the same right as the father to kill her new-born child.

The earliest restraints upon the power of the

head of the house were exercised by his kinsmen, and to some extent by those of his wife, and, when the family was recognized as a religious institution, by the priests. These restraints, which at an early period began to lift the wife out of the position of a mere chattel, affected but slightly the position of the child. (For that of the Roman child, see *PATRIA POTESTAS*.) In the old German law of the heathen period the infant was not to be exposed after it had been sprinkled with water and had received its name; nor was a child to be put to death subsequently without cause, nor to be sold except when the parents were in dire need. With the acceptance of Christianity by the Germans, the right of exposure disappeared, but the paternal power of punishment for crime and of sale in case of necessity were not at first affected. As regards personal property, all that the unmarried daughter or the son living in the paternal house acquired was acquired for the father. With respect to real property, however, the children's eventual rights were protected; inherited realty of the parents was "tied up" in the interest of the children, and a sale by the father conveyed no perfect title to the purchaser.

Mediæval Law. In the course of the Middle Ages the authority of the father assumed more and more the aspect of a natural guardianship and less of a property right. The mother, also, having herself become emancipated from the hand of her husband, acquired a subordinate authority. After the death of the father, or when he was incapable of exercising control over the children, the mother became their natural guardian.

The canon law introduced into the mediæval law of parent and child but one important modification, viz., the legitimation of children born out of wedlock by subsequent marriage between the parents. This rule was borrowed from the Roman law, but was extended by the Church; at Roman law it applied only to children of a concubine, at canon law it applied to all illegitimate children. When it came, however, to recognizing such children as heirs of real property, the Church encountered obstinate resistance. In many parts of Europe the Germanic law held its own, especially as regards the inheritance of entailed estates. The reception of the civil law had little influence upon the European law of parent and child, for the *patria potestas* of the Roman law was not generally received.

Modern European Law. In central and western Europe, exclusive of England and Ireland, maternity is purely a question of fact; paternity is based on the presumption that the child born or conceived in wedlock is the husband's child, but proof of the contrary is permitted. The child born out of wedlock, if "recognized" by the father, or if the fact of paternity be established by judicial inquiry, is entitled to support up to a certain age and has rights of succession in the paternal estate, but not the same rights as legitimate children. In the French law, however, inquiry into the paternity of the illegitimate child is not allowed, and such a child has no rights against the father unless it has been recognized. The legal relation of the parent and child is regularly established by birth in wedlock, by legitimation, or by adoption. A child born out of wedlock is legitimized by the subsequent marriage of the parents accompanied by recognition of the child; and in some countries (e.g., in Spain and in Germany) the child may be legitimized by ad-

ministrative decree issued at the father's request. Adoption is usually permitted only when the adopting parents are childless. Legitimation and adoption generally give parent and child the same rights which pertain to the parent and to the child born in wedlock.

The authority of the parent over the person of the child is that of a guardian; i. e., the element of duty is more emphasized than that of authority. In the exercise of parental authority the voice of the father is decisive, so that the parental rights of the mother become legally effective only when the father is dead, or when he is unable to exercise his rights or has been deprived of them by a decree of court. The administration of the property of children belongs to the parents—to the father as of right; to the mother, usually, only with the authorization of the family council or of the court—and in most of the codes the parents are not obliged to account for the income, their rights being those of usufructuaries; but where property is given or bequeathed to a child, the donor or testator may exclude this parental usufruct and even the parental administration. The parental usufruct is also excluded as regards money and property acquired by the child's separate labor and industry. In case of divorce or annulment of marriage, the control of the persons and the property of the children is regulated by order of the court. The authority of the widow or divorced wife over her children and her usufructuary rights are in all civil legislations impaired by her remarriage; and the German law makes provision for safeguarding the interests of children of the first marriage when the father marries again. Parental authority is extinguished when the child reaches full age or is emancipated. In many legislations, however, parental consent is necessary for the marriage of a child even after the child has reached full age. See MARRIAGE.

The chief duties of parents are the suitable support and education of their children. In many of the civil codes they are also bound to provide daughters with dowries. Parents are responsible for debts contracted by their children without their authorization only as a result of the duty of support and education (i. e., they are liable only for necessities). In most legislations they are liable for all torts committed by children; at German law, however, the parent is responsible only when the tort could and should have been prevented by him, i. e., when he has failed to exercise proper surveillance and control.

The Common Law. Legitimate Children.—By the common law of England and the United States the parents are the legal as well as the natural guardians and protectors of the child. They have the right to name the child and are entitled to his custody. As such custodians, they or persons *in loco parentis* may reasonably chastise the child, but for excessive punishment, amounting to willful or malicious cruelty, the parent may be civilly liable in an action of tort, or criminally liable for assault, or for homicide in case death ensues. At common law the parents could not be deprived of the custody and control of the child by third parties, but by modern legislation officers having supervision over public charities, and in some States private charitable corporations, may by proper legal proceedings acquire custody of the child, if subjected to cruel or improper treatment by the

parents. At common law, as between the father and mother, the father was deemed to be entitled to the custody of the child, but by Stat. 36 Vict., c. 12 (1873), the Court of Chancery may award such custody to the mother if it appears to be for the best interests of the child. This parental jurisdiction of the courts has been enlarged by subsequent legislation. (See particularly Stats. 49 and 50 Vict., c. 27; 56 and 57 Vict., c. 54; the Custody of Children Act, 1891, 54 Vict., c. 3, and the Prevention of Cruelty to Children Act, 1904, 4 Edw. VII, c. 15, § 6.) It is now the practice of courts generally in the United States, even in the absence of statute, to award the custody of the child to the parent best qualified and able to care for it.

In case of divorce or judicial separation of the parents, even in the absence of statute, courts having jurisdiction over divorce generally have jurisdiction to award custody of the children of the marriage. The right to custody may also be determined in a proper case by habeas corpus (q. v.), or in some States upon application to courts of probate or similar courts having statutory jurisdiction over the subject matter. If the parents separate by agreement, no stipulation entered into by them as to the custody of the child will be enforced by the courts if prejudicial to the child.

A parent or one *in loco parentis* is entitled to the services of a child until he comes of age, and if the services are rendered to others the parent is legally entitled to recover the reasonable value thereof unless payment is made to the child with the consent of the parent. As between the father and the mother, the father is entitled to the child's services, but upon the death of the father or upon custody of the child being awarded to the mother, she becomes entitled to the child's services. The right of the parent to take the child's earnings may be waived by his voluntary emancipation of the child. See EMANCIPATION.

Parents, as such, have no interest in or control over the property of their children, such control being exercised by guardians appointed by courts of chancery or probate having jurisdiction over the property of infants. (See GUARDIAN; WARD.) Wearing apparel and personal effects, however, purchased by the parent for an infant child remain the property of the parent and subject to his control. Rights of action belonging to the infant might be enforced at common law by an action brought by the parent as "next friend" (*prochein ami*) of the infant; and now by statute generally such actions are prosecuted in the name of the infant by a guardian *ad litem* appointed by the court, who may be but is not necessarily a parent of the litigant.

As the parent is legally entitled to the services of the child, any wrongful act of third persons interfering with this right is a tort, for which such third persons must respond in damages to the parent. Thus, a parent may recover all damages suffered by him by reason of loss of services of his child because of personal injuries inflicted upon the child by the negligent conduct of third persons. And in most jurisdictions he may recover also for the medical attendance supplied to the child.

Upon similar principles the parent may recover damages for the seduction of an infant daughter. Indeed, by the early law, as well as

in some States at the present time, the parent's right to recover for the seduction was based solely upon his right to recover for the loss of his daughter's services. The courts of some States, however, have departed from this rule and permit a recovery, even though the parent has emancipated his daughter and is therefore no longer entitled to her services. See **SEDUCTION**.

As regards the maintenance of the child, it is somewhat singular that according to the common law the parent is under no civil duty whatever to support the child. This defect in the law was partially remedied by the Poor Law, enacted by Parliament in the reign of Elizabeth, by which some legal duty was imposed upon parents and children to support each other when financially able to do so, or rather to assist the parish authorities in contributing to their support.

Similar statutes have been enacted in most of the United States, and in a few States the courts have indicated that the duty of a parent to maintain his child may also be enforced by third persons supplying necessities by an action in the nature of quasi contract.

While the parent is not at common law civilly liable to maintain his child, he is nevertheless criminally responsible if he neglects it and, by exposure or failure to provide it with food or clothing, causes the child's injury or death. Parents have been held guilty of manslaughter and even murder when death resulted from negligent or improper care of their children. The English courts have held that a parent who in good faith neglects to provide medical attendance for his child because he did not believe in the use of medicine was not criminally responsible for his neglect. The rule of this decision was promptly corrected by an act of Parliament, and it is now generally the law in the United States that a parent guilty of gross neglect in not providing proper medical attendance for his child is criminally responsible.

At common law a parent is not liable for the torts of his child unless their commission is incited or authorized by the parent, in which case the rules for determining his liability are the same as in the law of agency or master and servant.

At common law the child is an heir of the parent, subject in England to the rule of primogeniture (see **DESCENT**), and is also entitled to a share of the parent's personal estate under the various statutes of distribution (q.v.). This interest of the child in the parent's property may however be defeated by the parent's will, which may dispose of all his property to strangers. In several States it is provided by statute that children of a testator born after the execution of his will and of whom no mention is made in the will shall take the same share in the parent's property which he would have secured had the parent died intestate.

Illegitimate Children.—In strictness of law an illegitimate child, i.e., one born out of wedlock, has no parent, and consequently he has no rights as against his natural parents, and they owe him no corresponding obligation. Unmarried parents at common law were therefore not bound to support their illegitimate child, and in case of their death intestate he acquired no interest in their property as heir or next of kin. The English Bastardy Act (4 and 5 Wm. IV, c. 76, and 35 and 36 Vict., c. 63), which has

been substantially reenacted in most of the United States, has qualified the common-law rule as to the duty of parents to maintain their illegitimate children.

The English statute provides as follows: The father is not bound even by the poor laws to maintain the child, and the parish officers cannot institute any proceedings whatever against him for this purpose; but the mother or the guardian of the child may to a certain extent compel him to contribute towards the child's maintenance and education. The poor laws make the mother liable to maintain the child until it attains the age of 16; and not only is she so bound, but any man who marries her is also bound to support all her illegitimate children until they attain that age. As regards the custody of illegitimate children, the mother is the party exclusively entitled, for the father is deemed in point of law not to be related to such child. Yet, if the father has in point of fact obtained the custody of such child, and the child is taken away by fraud, the courts will restore the child to his custody, so as to put him in the same position as before.

The bastardy statutes in the United States in general differ only in minor particulars from the English statute. One important difference, however, is a provision generally adopted authorizing the poor officers or other designated officials to bring bastardy proceedings directly against the putative father without the intervention of the mother. Although the father of an illegitimate child is under no direct positive obligation to support his child, the natural relationship has been held in some States to be a sufficient consideration to support and render enforceable the father's promise or agreement with third persons to pay for the support of the child even if made after the support has been given.

In some States also illegitimate children are by statute made heirs at law of the mother. Such is the law in New York, provided the mother leave no legitimate children. The mother may also inherit from her illegitimate child.

PARENZO, pá-rén'dzò (Lat. *Parentium*). A town on the west coast of the Crownland of Istria, Austria, situated on a rocky peninsula, 35 miles south by west of Trieste (Map: Austria-Hungary, C 4). It is the seat of the Provincial Assembly and of a Roman Catholic bishopric and has a good harbor. Its principal building is the cathedral of St. Maurus, a basilica of the sixth century containing fine mosaics. There are also ruins of Roman buildings; the smaller relics of that period are contained in the museum of the Istrian Archaeological Society. The chief occupations are fishing, ship-

building, and trade. Pop., 1911, 17,523, mostly Italians. Parenzo was a Roman colony, Parentium; it became a part of the Venetian Republic in 1267 and remained so until its dissolution. The bishopric of Parenzo was founded about 524 and united with that of Pola in 1827.

PAREPA-ROSA, EUPHROSYNE (1836-74). An English soprano. She was born at Edinburgh and was the daughter of Georgiades de Boyescu, a Wallachian nobleman, and Elizabeth Seguin. She studied under Crescentini, Panseron, and Bordogni and made her first appearance as a singer at Malta under the name of Parepa. She made her debut in London in 1857 and in 1863 married Captain Carvell, who died two years later. She then went to America and appeared at Irving Hall, New York, in 1865. In 1867 she married Carl Rosa, the violinist and operatic manager and conductor, with whom in 1869 she organized an English opera company. Her voice was remarkable for its purity and flexibility and had a compass of two and one-half octaves. She died in London.

PARESIS, *pār'ê-sis* (Neo-Lat., from Gk. *πάρεσις*, letting go, paralysis, from *παρίεναι*, to relax, from *παρά*, *para*, beside, beyond + *lévai*, *hienai*, to let go, send), **GENERAL PARESIS**, **PARETIC DEMENTIA**, **DEMENTIA PARALYTICA**, **GENERAL PARALYSIS OF THE INSANE**, popularly but improperly called **SOFTENING OF THE BRAIN**. "A chronic progressive psychosis, characterized clinically by mental, motor, vasomotor, and sensory symptoms, and pathologically by organic changes in the brain and spinal cord, probably toxic." (Starr.)

Etiology. The disease is five times more prevalent in males than in females and occurs especially between the ages of 35 and 40, rarely earlier than 25 or after 55. In 50 per cent of the cases defective heredity is noted, but it is not causative. Large cities and manufacturing centres furnish by far the most cases; it is rare in farming districts. It is now conceded that the cause is syphilis, which operates to produce the disease in patients undermined by alcohol, sunstroke, head injury or mental shock, in most instances, through a profound disturbance of metabolism, which develops a toxin causative of the pathological changes.

Pathology. The earlier changes consist of congestion of the vessels of the brain and pia mater, exudation of serum into the perivascular lymph spaces, and an increase in the nuclei and cellular elements of the walls of the vessels. Following these vascular changes, and probably in a measure dependent upon them, is an increase in the neuroglia or connective tissue of the brain. This neuroglia increase often goes on quite rapidly and determines a corresponding shrinkage and atrophy of the nervous tissue proper. As the process continues there are degenerative changes in the nerve cells and fibres, with pigmentation and the formation of cyst-like cavities. There are usually an increase of fluid in the ventricles and thickening of the ependyma. With the full development of the lesion the brain atrophies, becomes shrunken, weighs less than the normal brain, the convolutions are smaller and the sulci more widely open. These changes affect the whole brain, but are most marked in the frontal and parietal lobes. Accompanying the brain lesions there are often a chronic meningitis and sclerosis of the posterior columns of the cord. Sclerosis of the lateral columns may also occur.

Symptoms. The onset is gradual. It is first noticed by friends that the patient does not seem in his usual frame of mind. He is irritable, either depressed or excitable, is growing distractible and inattentive, and disoriented. He soon becomes inattentive to business, but plans absurd projects of great magnitude and very numerous, which involve expense entirely out of proportion to the man's means. The patient feels well, often saying that he never felt better in his life. A marked egotism usually develops. He boasts of his wealth, power, and abilities, even when tottering about, unable to write or to dress himself. Soon he becomes forgetful, careless, inattentive, unable to carry on a logical argument. This becomes noticeable in his conversation, which is disconnected. The memory defect is marked, especially in the time element for recent events. Finally, remote memory also suffers, and entire lapses occur. The patient tells of his ivory vest with diamond buttons, his yachting trip to Honduras and back during the morning, his purchase of a million shares in the stock market, his hundred beautiful Circassian wives. Headache and sleeplessness are common, and there is a marked loss in weight and in strength. Even though previously a man of exemplary habits, the patient becomes neglectful of the ordinary proprieties of life, uses bad language, ignores family obligations, loses his temper, and indulges in sexual and alcoholic excesses. This condition lasts from one to three years and passes over gradually into a fully developed dementia. This condition is marked by an increase in the symptoms above described. Egotism is usually a marked feature, and delusions of grandeur are the rule. Instead of exaltation there may be depression, which is frequently the case in women, or melancholy and elation may alternate. Illusions and delusions are common, hallucinations less frequent; but there are no fixed systematic delusions, as is the case in paranoia. The emotions are in a state of unstable equilibrium. The patient is easily moved to laughter or tears. Slight causes produce intense excitement, which may take the form of rage or frenzy, rendering the patient dangerous to his fellows. There is rarely any suicidal tendency. Self-control is weakened, and consequently voluntary actions are weak, irresponsible, and impulsive. Self-consciousness is impaired, the patient failing to appreciate his changed mental condition. He is contented wherever he is, is not concerned about the anxiety of his friends, loss of money or business, or even in the least about hospital confinement. Of motor symptoms, tremor of the tongue and face muscles appears first. Later almost any motion is attended with trembling. This results in thickness of speech and in clumsiness in the finer coördinate movements, such as writing. These motor symptoms gradually pass over into a paralysis, which becomes increasingly widespread and increasingly complete. The patient may lie for a year or two on a water bed, unable to move any but the muscles of swallowing, voluntarily. There is also marked increase or marked decrease in the reflexes, with retention of urine and loss of control of the rectum. Of sensory symptoms, headache, tinnitus, disordered sight are early symptoms, while anæsthesia and analgesia are late manifestations. Bed sores and cystitis are very common. The average duration of the disease is four years,

but well authenticated cases are on the records of hospitals concerning patients who survived for nine years. In the early stage of the disease there may be transient paralysis of one arm or one leg. There may be convulsions occurring at intervals of a few days, which may be mistaken for epilepsy. In the last stages convulsions are usual and severe. Death results from exhaustion, frequently from convulsions, from cerebral hemorrhage, or from some intercurrent complication, such as pneumonia, cystitis, or obstruction of the bowels.

Treatment. Antisyphilitic treatment is often detrimental, but it may be tried in the early stages, with enforced rest, diet, massage, and careful hydrotherapy (prolonged warm baths, also cold packs). Later the treatment is entirely symptomatic, tonic, sedative in conditions of excitement, while in the later stages confinement in an institution or constant home care is necessary. Consult: A. R. Diefendorf, *Clinical Psychiatry*, adapted from Emil Kraepelin, *Lehrbuch der Psychiatrie* (2d ed., New York, 1907); Clark and Diefendorf, *Neurological Mental Diagnosis* (ib., 1908); Joseph Rogues de Fursac, *Manual of Psychiatry*, translated and edited by A. J. Rosanoff (3d Amer. ed., ib., 1911). See **INSANITY**; **PARALYSIS**.

PARFLECHE, pār-flēsh'. A name of French origin, applied to a peculiar flat rectangular rawhide bag of Indian make, the front of which is decorated with geometric designs. In museums parfleches are the most conspicuous object in collections from the Plains Indians. See **INDIANS, AMERICAN**.

PARGA, pār'gā. A town in the Kingdom of Greece, situated on the shore of the Ionian Sea, opposite the island of Paxos (Map: Balkan Peninsula, C 5). It is built on a steep cliff, surmounted by an almost impregnable citadel, and has a harbor defended by a small island. Parga, founded in the last days of the Roman Empire, was independent and under the protection of Venice from 1401 to 1797, when it was for a short time governed by the French. In 1814 Ali Pasha, Governor of Albania, besieged it, and the people applied to the British for aid. Great Britain took possession of the fortress, but in 1819 handed it over to Ali Pasha. Thenceforth until its capture by the Greeks in 1912, Parga was an unimportant town of the Ottoman Empire in the Vilayet of Janina. Its cession to Greece was confirmed by the Treaty of Bucharest (Aug. 6, 1913). Its present population is about 5000.

PAR'GASITE (named from *Pargas*, Sweden, where it is found). A name applied to the green and bluish-green varieties of hornblende. Pargasite is usually found in the form of stout lustrous crystals, although sometimes occurring in the granular form. It is readily distinguished from the common hornblende, which is usually dark green or black in color.

PAR'GO. A fish, a snapper of the genus *Neomamis*. The familiar red snapper is "pargo colorado," called in Havana markets "pargo guachinango," or Mexican snapper, because brought from the Mexican coast. The silk snapper is "pargo de lo alto."

PARHELIA. See **HALO**.

PARIA, pār'ri-ā, GULF OF. An inlet of the Atlantic Ocean on the coast of Venezuela (Map: Venezuela, E 1). It is 40 miles wide and 100 miles long and almost completely landlocked, being cut off from the Caribbean Sea by the

narrow and rocky Paria Peninsula, while across its mouth lies the island of Trinidad. The gulf communicates with the ocean on either side of the island by the straits known as the Dragon's Mouth in the north and the Serpent's Mouth in the south, each about 10 miles wide. They were thus named by Columbus, who discovered them in 1498, because of the difficulties he found in navigating the strong currents which race through them. The gulf receives the northern arms of the Orinoco delta.

PARIAH, pār'ri-ā (from Tamil *pariah*, *pariar*, drummer; from *parai*, drum: so called because they are hereditary drum beaters). The name applied to aboriginal individuals of low class throughout southern India, who do not belong to any of the castes of the Brahmanical system. They are shunned even by the lowest Hindus who profess Brahmanism, since the touch of a pariah renders a Brahman impure. Pariahs were formerly compelled to wear a bell to warn Brahmans of their proximity. The pariahs are of Negrito origin, as shown by their short woolly hair, flat nose, thick lips, and short stature. They, like the Hindus, are divided into distinct grades and imitate their superiors in that the lowest pariah is as careful to preserve his status as the proudest Brahman. In the Tamil country they form a large part of the population and are employed as agricultural laborers or as servants to Europeans. In station, however, they are superior to other aborigines. Consult Louis Lapicque, "Le problème anthropologique des Parias et des castes homologues chez les Dravidiens," in *Bulletin de la Société d'Anthropologie de Paris*, vol. vi (Paris, 1905), and Gustav Oppert, "Ueber die indischen Parias," in *Archiv für Anthropologie*, vol. xxxii (Brunswick, 1906).

PARIAH DOG. The native cur of Egypt, Persia, and all Oriental countries, regarded merely as an outcast and a scavenger. According to Youatt, there are several varieties, viz., (1) a wild form bred in the jungles and lower ranges of the Himalaya, of a reddish-brown color, with sharp pointed ears; (2) a form in inhabited districts among which turnspits are often found; (3) the Sumatran form, which has the countenance of a fox, eyes oblique, ears rounded and hairy, muzzle foxy brown, tail bushy and pendulous; (4) the Javanese indigenous dog. Stonehenge describes the pariah dog as a cross between a dhole and any domesticated dog of the neighborhood, and Fitzinger calls it a variant of the sheep dog. The pariah dogs of Egypt appear to belong to a single race and, according to Lydekker, are about the size of a sheep dog, but of a stouter build, with a broader head, the tail being long, generally bushy, and carried close to the ground. The general color of their coarse rough hair is reddish brown, tending in some individuals more decidedly to gray and in others to yellow. Occasionally black or tawny individuals may be observed. Their ears are short, pointed, and usually erect.

PARIAN. A composition of porcelain glays used for ceramic statuettes. It is called Parian from its resemblance in lustrous transparency to marble (q.v.). In this respect it is superior to biscuit (q.v.), a more opaque porcelain used for the same purpose. Parian was invented by a Mr. Battam, and was first produced in the Copeland manufactories.

PARIAN CHRONICLE. A marble slab

containing the most important inscription among the Arundel Marbles (q.v.).

PARIETAL BONES. See SKULL.

PARIEU, pá'ryé', MARIE LOUIS PIERRE FÉLIX ESQUIRON DE (1815-93). A French politician and economist, born at Aurillac. He studied at Paris and Strassburg and practiced law at Rouen. In 1848 he was elected to the Constituent Assembly, where he voted with the Moderate Left. From 1849 till 1851 he was Minister of Public Instruction. He joined the Bonapartist party, and became a member of the Council of State in 1852. In the ministry of Ollivier he was President of the Council of State. He served as Senator from Cantal in 1876, but was defeated in the election of 1885. He was one of the most earnest advocates of a single gold standard in France. His chief works are: *Traité des impôts* (1862-64); *Principes de la science politique* (1870); *La politique monétaire en France et en Allemagne* (1872); *Histoire de Gustave-Adolphe* (1875).

PARIGOT, pá'régó', HIPPOLYTE (1861-). A French literary critic, born at Troyes and educated at the lycées of Troyes and Louis le Grand, and at the Ecole Normale Supérieure. Gaining the degree of doctor of letters in 1898, he afterward taught at various lycées, finally becoming professor of rhetoric at the Lycée Condorcet. He was made Knight of the Legion of Honor. His writings, mostly on nineteenth-century literature and especially the drama, comprise: *Emile Augier* (1892; 6th ed., 1900); *Diderot* (1893); *Le théâtre d'hier* (1893), crowned by the French Academy; *Génie et métier* (1894); *L'imitation dans la poétique d'Aristote* (1898); *Le drame d'Alexandre Dumas* (1899), crowned by the Academy; *Stendhal* (1901); *Alexandre Dumas, père* (1902); *Renan et l'égoïsme intellectuel* (1909). His later work was contributed largely to *La Revue de Paris* and *La Revue Bleue*.

PARILIA. See PALILIA.

PARILLA (pá-ril'á) **YELLOW.** See MOON-SEED.

PARIMA, pá-ré'ma, SIERRA DE. An isolated mountain system running along part of the boundary of Venezuela and Brazil, with a chain extending into Venezuela, and forming part of the divide between the Orinoco and the Amazon (Map: Brazil, E 3). Though the name Parima is commonly extended to the whole system, the eastern range is also known as the Sierra Pacaraima. It forms a vast turtle-back plateau consisting of a granite core underlying Old Sandstone strata. This plateau is crossed in various directions by short ridges, and falls, especially towards the Amazon valley, by several steep escarpments. The higher ridges are generally barren rocks, but the plains intervening between the successive escarpments are covered with grass or forests. The system is neither so high nor so sharply defined as the northern mountains of Venezuela. The highest points are Mount Maraguaca, 8230 feet, and Mount Duida, 8120 feet. The latter is a conspicuous landmark, situated near the point of bifurcation of the Orinoco and the Cassiquaire.

PARINI, pá-ré'né, GIUSEPPE (1729-99). An Italian poet, born at Bosio, May 23, 1729. Forced by circumstances to become a priest, he took orders in 1754 and became preceptor in the Serbelloni family, Milan. After the appearance of his first verses he was made a member of the Accademia dei Trasformati, and

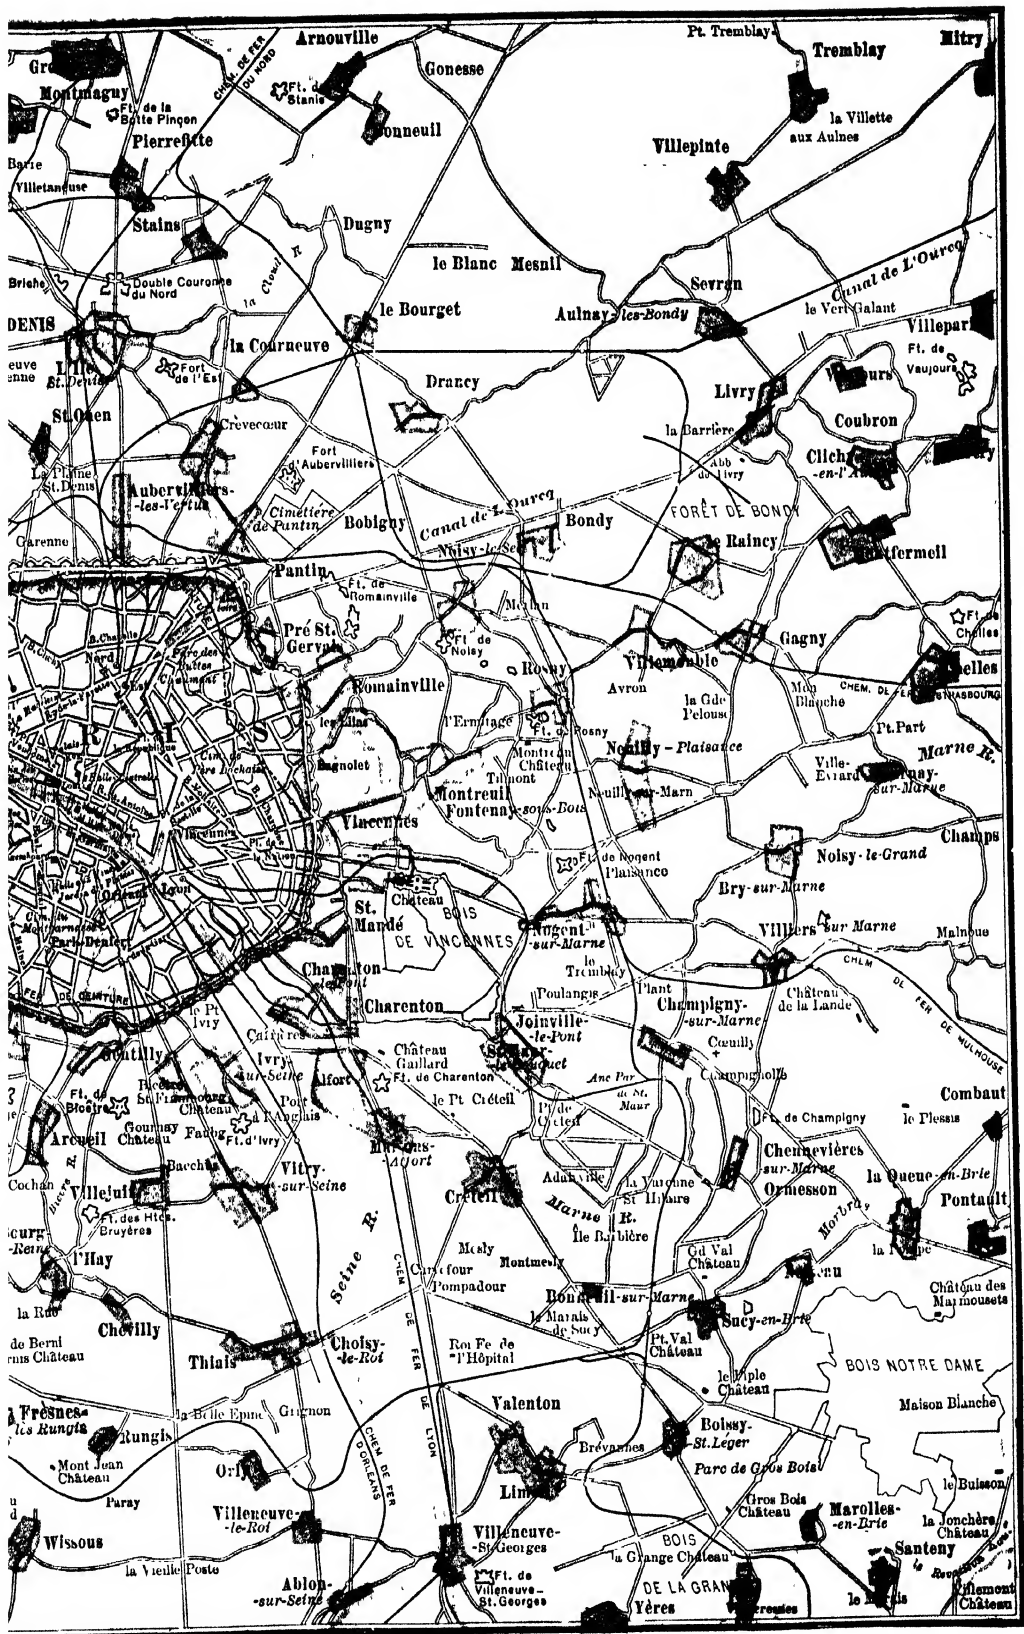

he was admitted into a branch of the Arcadia. From 1773 on he taught the principles of fine arts at the Brera in Milan. Bonaparte, whose appearance on Italian soil made him hope much for Italy, gave him an office in the city government, but Parini could not conceal his disapproval of the consular unscrupulousness, and after three years his services were dispensed with. His criticism of society found its most complete expression in the *Giorno*, written after 1760, one of the most important literary productions of Italy in the eighteenth century. A trenchant satire of vicious conditions, it is admirable for beauty of verse as well as for faith in the fundamental soundness of family, country, and humanity.

In the *Odi*, 19 in number and written between 1757 and 1795, the destructive criticism of the *Giorno* gives place to constructive teaching. He wants to give his fellow citizens a sane conception of life, of duty. As to form, while there is an occasional reminiscence of early Arcadian influence, there is a vigor and nobility of language, and a clearness of conception, which strike a new note in lyric poetry. Consult Reina's edition of the *Opere di Giuseppe Parini* (Milan, 1801-04), which is still the most nearly complete collection of his works and contains his prose productions (mainly academic discourses) as well as his verse, reproduced by M. Scherillo, *Poesie scelte e illustrate di Giuseppe Parini* (Milan, 1900), and by G. Natali, *Poesie di Giuseppe Parini* (Milan, 1905); also Bertoldi's *De Odi di Giuseppe Parini* (Florence, 1911). Of the *Odi* the best edition is that of Salveraglio (Bologna, 1882). Consult also Cerquetti, *Il testo più sicuro delle Odi di Giuseppe Parini* (Osimo, 1892).

PARIS, pá'rís, *Fr. pron.* pá'ré'. The capital of France, the third largest city of the world, situated on both banks of the river Seine, 233 miles, or 110 miles in a direct line, from its mouth, lat. 48° 50' N., long. 2° 20' E. The city consists of 20 arrondissements; these together with the suburban arrondissements of Saint-Denis and Sceaux form the Department of Seine (q.v.) (Map: France, N., H 4). Paris is encircled by a wall about 21½ miles long. Within this circuit the 20 arrondissements (6 on the left and 14 on the right bank of the Seine) have an area of 7802 hectares (about 30.1 square miles, or 19,279 acres). The city lies in a hollow, about 200 feet above the level of the sea, and is surrounded by low hills, which to the north, at Belleville and Montmartre, reach a maximum altitude respectively of 330 feet and 420 feet. These hills, separated by narrow valleys or plateaus, as those of Saint-Denis to the north, Ivry to the southeast, Montrouge to the south, and Grenelle to the southwest, are encircled at a distance of from 2 to 5 miles by an outer range of heights, mostly fortified, which include Mont Valérien, 450 feet above the Seine, the highest point in the immediate vicinity of the city, Villejuif, Meudon, and Saint-Cloud. The hollow is a small level plain of Tertiary formation, known as the Paris basin, composed at varying depths of different strata of gypsum and marls abounding in fossil remains, siliceous limestones, and a vast chalk bed. The strata provide in part the city's building material, stone, gravel, etc. The climate is fairly uniform and mild, pleasant and healthful, the mean annual temperature being about 50° F., the mean January temperature 36°, July 65°. The river seldom freezes. Rain falls on an aver-

[illegible]

A detailed black and white map of Paris and its vicinity. The map shows the city of Paris in the center, with its characteristic circular layout and numerous districts labeled. Surrounding Paris are various towns and villages, including Versailles to the west, St. Germain to the northwest, and Boulogne to the north. The map also shows the Seine River and other water bodies. A scale of miles and kilometers is provided in the top left corner. The map is titled "PARIS AND VICINITY" and includes a scale of miles and kilometers. The map is a historical or reference map, showing the city's layout and surrounding areas in detail. The map is a black and white print, with labels for numerous locations and features. The map is a detailed representation of the Paris region, showing the city's layout and its relationship to the surrounding landscape. The map is a valuable resource for understanding the geography and history of Paris and its vicinity. The map is a detailed and accurate representation of the Paris region, showing the city's layout and its relationship to the surrounding landscape. The map is a valuable resource for understanding the geography and history of Paris and its vicinity. The map is a detailed and accurate representation of the Paris region, showing the city's layout and its relationship to the surrounding landscape. The map is a valuable resource for understanding the geography and history of Paris and its vicinity.

age on about 200 days in a year, the average quantity during that period being about 20 inches.

The encircling wall of the city is fortified by 94 bastions, pierced by 57 gates, and having a glacis and moat 48 feet wide. In addition there are 17 detached forts within a distance of 2 miles and 19 outlying fortresses encircling an area of 400 square miles. The modern enceinte was constructed by Louis Philippe in 1841-44, but the outlying fortresses were added after the War of 1870. The city has been regarded as the greatest fortress in the world.

Steam and electric railroads give access to the numerous suburbs famous alike for their picturesque situations and historical associations. These include the more immediate suburbs of Boulogne, with the famous Bois de Boulogne (bordering Paris on the west), adjoining which is the race course of Longchamps, Neuilly, Levallois-Perret, Clichy-la-Gareigne, Suresnes, Puteaux, Courbevoie, Asnières, Aubervilliers, Bobigny, Pantin, Pré-Saint-Gervais, Vincennes, with its wood, fort, château, and race course, Charenton, Ivry, Gentilly, Arcueil, Bagneux, Chatillon, Montrouge, Vanves, Issy, Meudon, and the more distant Versailles with its palace, gardens, fountains, art collections, and the Grand and the Petit Trianon; Rambouillet, with its castle, parks, and gardens; Saint-Cloud, with its palace and park; Saint-Germain-en-Laye, with its two castles; Sèvres, famous for its porcelain factories; Saint-Denis, with its abbey cathedral, where the kings of France are buried; Enghien, noted for its sulphur springs, on a wooded lake near the forest of Montmorency; Argenteuil, a favorite boating resort; Mériel, which derives its celebrity from the neighboring Abbaye du Val, a twelfth-century monastic edifice of great archaeological interest; Dampierre, with the splendid ducal château of the Luynes family; Fontainebleau, with its palace, fine-art collections, and its extensive forest with Barbizon, the resort of artists, on the western border; Malmaison, with the former château of the Empress Josephine; and Marly-le-Roi, with its forest and aqueduct.

Communications and Bridges. The wall-girt city is entered by six lines of railway. The palatial stations in the metropolis include the Gare du Nord on the Place Roubaix, the Gare Saint-Lazare, facing the Rue Saint-Lazare, the Gare de l'Est or de Strasbourg on the Place de Strasbourg, the Gare d'Orléans on the Quai d'Austerlitz, and the Gare de Lyon on the Boulevard Diderot. The Seine, which enters Paris in the southeast at Bercy, about a mile below its junction with the Marne, is spanned by 32 bridges. It leaves the city at Point du Jour in the southwest, having divided it in two parts and having formed the two islands of La Cité and Saint-Louis, which are both covered with buildings. The river at Paris is from 300 to 500 feet wide. The most celebrated and ancient of the bridges crossing the river are the Pont Notre-Dame, dating from 1500, and the Pont Neuf, begun in 1578, completed by Henry IV in 1604, and thoroughly restored in 1852. The latter, which crosses the Seine at the lower end of the Ile de la Cité, is 1080 feet long and abuts near the middle on a small peninsula planted with trees which form a background to the equestrian statue of Henry IV, which stands in the central open space on the bridge. Among the other bridges the handsomest include the Pont de la Concorde, 160 yards long, built in

1781-90; the Pont d'Austerlitz (1802-07; widened, 1885); the Pont d'Iéna (1809-13); the Pont du Carrousel, built under Louis Philippe; and the Pont des Invalides, Pont de l'Alma, and Pont de Solférino, all fine structures, adorned with military and naval trophies commemorative of events and victories connected with the Second Empire. Among the most recent and one of the most striking is the Pont Alexandre III (1896-1900), named in honor of the Czar, and the Pont Mirabeau, connecting Auteuil and Grenelle. These bridges all communicate directly with the spacious quays, planted with trees, which line both banks of the Seine and which, together with the boulevards, give characteristic beauty to the city. Although the most ancient quays, as the Quai des Augustins and the Quai de la Mégisserie, date from the fourteenth century, the greatest part of these magnificent embankments, measuring 12 miles in extent, is due to Napoleon I and Napoleon III.

Streets, Buildings, Monuments, etc. The private houses, most of which are of the apartment or flat-house order, rising to six or seven stories, as well as the public buildings, are built of a light-colored limestone, easily wrought and carved ornamentally. Among the finest of the wide and straight streets are the Rue de Rivoli, 2 miles in length, the Rue de la Paix, the Rue du Faubourg-Saint-Honoré, the Rue Royale, and the Avenue de l'Opéra. The boulevards, which extend in an irregularly circular line on both sides of the Seine, generally on the site of the ancient ramparts, between the nucleus of the city and its surrounding quarters, present the most striking feature of Parisian life. In all the better parts of the city they are lined with trees, seats, and little towers, called *vespasiennes*, covered with advertisements. Restaurants, cafés, shops, and various places of amusement succeed one another for miles, their character varying from the height of luxury and elegance in the Boulevard des Italiens and the Boulevard Haussmann, to the domestic simplicity of the Boulevards Beaumarchais and Saint-Denis. Among the public squares or places, of which there are over 130, mostly owned by the municipality, the most noteworthy is the Place de la Concorde, which connects the gardens of the Tuileries (q.v.) with the Champs Elysées (q.v.) and embraces a magnificent view of some of the finest buildings and gardens of Paris. In the centre is the famous obelisk of Luxor, brought from Egypt to France in 1836 and covered over its entire height of 76 feet with hieroglyphics. On the site of this obelisk stood the Revolutionary guillotine, at which perished Louis XVI, Marie Antoinette, Philippe Egalité, Danton, Robespierre, and a host of others. Two magnificent bronze fountains by Hiltorf and eight allegorical statues representing eight former capitals of provinces, including Strassburg, are among the other embellishments of this square, which is one of the finest in Europe. Of the other squares the following are some of the handsomest: the Place du Carrousel, west of the Louvre, with the Arc de Triomphe du Carrousel, erected by Napoleon I in commemoration of his victories in the campaigns of 1805-06; the Place de la République, with a fine bronze statue of the Republic; the Place de l'Opéra; the Place Vendôme, with Napoleon's column of victory; the Place de la Bastille, where once stood that famous prison and fortress (see BASTILLE); the Place de la Nation, formerly Place du Trône (with its fine

fountain and monumental group, the Triumph of the Republic); the Place de l'Hôtel de Ville, formerly Place de la Grève, for ages the scene of public executions and the spot at which some of the bloodiest deeds of the Revolution were perpetrated. The Porte Saint-Martin and the Porte Saint-Denis, which were erected by Louis XIV to commemorate his victories in the Low Countries, and are adorned with bas-reliefs representing events of these campaigns, mark the ancient limits of the most turbulent quarters of the Paris of the past; the Arc de Triomphe de l'Etoile, 160 feet high and 146 feet wide, begun by Napoleon I in 1806 and completed in 1836 at a cost of more than \$2,000,000, may be said to form the extreme western boundary of the aristocratic quarters. It is profusely adorned with bas-reliefs representing victories of Napoleon and with four colossal allegorical groups representing the Departure, War, Victory, and Peace. The great streets which radiate from the Arc de Triomphe de l'Etoile are among the most magnificent of Paris and form the finest quarter. The Place de l'Etoile is connected with the Champs Elysées by the Avenue des Champs Elysées, with the celebrated Bois de Boulogne (q.v.) by the Avenues Grande Armée, Bois de Boulogne, and Victor Hugo and the Portes Neuilly, Dauphiné, and Maillot; and it communicates by the Avenues Kléber and d'Iéna with the Place, the Parc, and the Palais du Trocadéro.

The Palais du Trocadéro, named after a Cadiz fort taken in 1823 by the French, dates from the Exhibition of 1878; it is a mammoth building of Oriental architecture and crescent form, on an elevation above a huge ornamental cascade. It has valuable museums of comparative sculpture and of ethnography, and its fine Salle des Fêtes, containing a huge organ, can accommodate 6000 persons. In the well-kept park is a subterranean aquarium. The Pont d'Iéna leads from the Parc across the Seine to the historic Champ de Mars (q.v.), the site of the universal expositions since 1867 and of the Eiffel Tower (q.v.), 984 feet high, built for the Exposition of 1889. On the southeast is the Ecole Militaire, founded in 1752 and formerly used as barracks for infantry and cavalry, but now occupied by the Ecole Supérieure de Guerre. Near by is the Hôtel des Invalides (q.v.), founded in 1670 for disabled soldiers. The crypt of the church contains the sarcophagus, hewn from a huge block of Russian granite, in which lie the remains of Napoleon I, deposited there in 1861. The Musée d'Artillerie in the west wing comprises an historical collection of 10,000 war implements. The fine Esplanade des Invalides, fronting the building and bordered by the Quai d'Orsay, connects by the Pont Alexandre III with the Champs Elysées on the north bank. Here are situated the Palais de l'Elysée (1718), the official residence of the President of the Republic, the Grand and the Petit Palais des Beaux-Arts, where the Salons are held, and the Palais de Glace, the three latter built for the Exposition of 1900, having replaced the Palais de l'Industrie built for the first Great Exposition in 1855 and until 1897 serving for the annual exhibitions of the Salon. Thence through the Place de la Concorde the Jardin des Tuileries is reached, to the east of which is the Louvre (q.v. and Plate), forming a square of 576 by 538 feet, remarkable, especially the eastern façade, for its architectural beauty.

The Louvre, formerly a royal residence, was connected with the celebrated palace of the Tuileries (q.v.) by a great picture gallery, and between the two palaces lay the Place du Carrousel. Napoleon III further connected the Tuileries and the Louvre on the northern side, throwing them into one vast building, which formed the most palatial structure in the world. The Tuileries continued to be occupied as the residence of the Imperial family; but the Louvre proper, with its series of great galleries, formed a vast museum of pictures, sculptures, and collections of Egyptian, Greek, and Roman antiquities. The Communards of 1871 attempted to burn the whole pile and succeeded in destroying the Tuileries and a corner of the Louvre; the ruins of the Tuileries were demolished in 1883, except the rebuilt corner pavilions de Flore and de Massan. The library of the Louvre, with its contents, was burned, but the rest of the building and its priceless treasures were saved. North of the Louvre is the Palais Royal (q.v.), and north of the Palais Royal is the Bourse or Exchange (1808-26; enlarged, 1903), a beautiful structure in Græco-Roman style, surrounded by 66 Corinthian columns, to the east, on the north bank of the Seine, opposite the Île de la Cité, is the Hôtel de Ville. The original structure, erected between 1533 and 1628, was burned by the Communards in 1871; it was rebuilt in 1876-84 in the original Renaissance style, and is one of the most magnificent buildings in Paris. It is the residence of the Prefect of the Seine and includes all the offices for the transaction of the municipal business of Paris. Not far from the Hôtel de Ville is the Tour Saint-Jacques, a square Gothic tower 175 feet high, dating from 1504-22 and until recently utilized as a meteorological observatory, it affords one of the finest views in Paris. Almost opposite, on the northern bank of the Cité, stands the vast Palais de Justice, originally the residence of the kings of France; some parts of it date from the fourteenth century, others are modern. It is the seat of some of the courts of law, as the Court of Cassation and the tribunals of first appeal and of police. Within the precincts of this palace are the fine Gothic Sainte-Chapelle (1245-48) and the noted old prison of the Conciergerie, in which Marie Antoinette, Danton, and Robespierre were successively confined. The Conciergerie, in which prisoners are lodged pending their trial, constituted one of the eight prisons of Paris, of which the principal were La Force, Sainte-Pélagie, Saint-Lazare, Mazas, and La Roquette. The latter were replaced about the end of the nineteenth century by the modern prison of Fresnes-les-Rungis, which covers 50 acres, the Conciergerie alone being retained.

Among other notable features on the north of the river are the mammoth Halles Centrales or Central Markets, the Marché du Temple, and the Parc des Buttes-Chaumont. The palace of the Luxembourg (q.v.), on the south side of the Seine, was built in the Florentine style by Jacques Debrosse for Marie de' Medici. It contains many magnificent rooms, including the handsome chamber in which the Senate meets. In an adjacent building is the Luxembourg Museum, devoted to the works of modern artists. The gardens of the Luxembourg are extensive and of great beauty. Also on the south side of the river are the Sorbonne (q.v.), the centre of the famous Latin Quarter, the Panthéon (q.v.),

the Jardin des Plantes, the large Halle aux Vins, the Hospice de la Salpêtrière, the Observatory, and the cemetery of Mont Parnasse.

Paris has many theatres and places of amusement suited to the tastes and means of every class. The Opéra, Théâtre Français (chiefly devoted to classical French drama), Odéon, and Opéra Comique receive a subvention from the government. The opera house, completed in 1875, is a magnificent building, costing, exclusive of the site, \$5,600,000. It is at present the largest theatre in the world, occupying an area of about 2¾ acres; its auditorium, however, which seats 2500, is surpassed in size by many others in Europe and America. Its most striking features are the magnificent grand staircase and the foyer with admirable decorations. Other notable theatres are the Gymnase, Variétés, Vaudeville, Porte Saint-Martin, and Palais Royal. Cheap concerts, equestrian performances, and public balls, held in the open air in summer, supply a constant round of gayety to the bourgeois and working classes at a moderate cost, and form a characteristic feature of Parisian life.

Among the large number of churches the grandest and most interesting from an historic point of view is the cathedral of Notre-Dame (q.v.), which stands on a site on the Ile de la Cité successively occupied by a pagan temple and a Christian basilica of the time of the Merovingian kings. The present building was constructed between 1163 and 1265; since then it has been but slightly altered, and in its present state of restored magnificence ranks as one of the noblest specimens of Gothic architecture. Saint-Germain-des-Près, which is probably the most ancient church in Paris, was completed in 1163. Of nearly equal antiquity is Saint-Pierre-de-Montmartre. Saint-Etienne-du-Mont (1517-41) and Saint-Germain-l'Auxerrois (thirteenth to sixteenth century) are interesting, the former for its picturesque and quaint decorations and for containing the tomb of St. Genevieve, the patron saint of Paris, and the latter for its rich decorations and the frescoed portal, restored at the wish of Margaret of Valois, and for the fact that from its little bell tower the signal was given for the massacre of the Huguenots on St. Bartholomew's night. The Sainte-Chapelle, built by St. Louis in 1245-48 for the reception of the crown of thorns and other relics which he had brought from the Holy Land, is one of the most remarkable buildings in Paris, profusely decorated in all parts with brilliantly colored materials. In Saint-Eustache, erected 1532-1637, the largest parish church in Paris, interesting artistically as a Gothic structure carried out wholly in early Renaissance style, the Feast of Reason was celebrated in 1793: here is performed probably the finest religious music in Paris. Saint-Sulpice, finished in 1749, is noticeable for its size, measuring 462 feet in length, 183 feet in width, and 108 feet in height. Among modern churches are: the Madeleine (q.v.), built in imitation of a Greek temple and surrounded by a colonnade of 54 massive Corinthian columns—the building having no windows, the light enters through the ceiling of the three cupolas surmounting it and the interior is gorgeous with gildings, frescoes, carvings, marbles, and statues; the Panthéon (q.v.), which was begun as a church, but converted by the Constituent Assembly at the time of the Revolution into a temple dedicated to the great men of the nation,

was restored to the Church by Napoleon III and rededicated to St. Genevieve, but was definitely secularized in 1835, when Victor Hugo was buried there; Notre-Dame-de-Lorette, erected in 1823-36, a flagrant specimen of the meretricious taste of the day; Saint-Vincent-de-Paul, completed in 1844, an imposing monument of the Neo-Greek style; and, crowning the height of Montmartre, the national votive church of the Sacré Cœur, begun in 1875, a Romanesque edifice with five domes and a campanile 263 feet high. Among the Protestant churches L'Oratoire, built in 1645, is the largest and the best known.

Paris has a number of cemeteries, of which the principal one is Père Lachaise, extending over 110 acres and filled in every part with monuments erected to the memory of the multitude of celebrated persons who have been buried here. The Morgue, recently removed from its former site on the Ile de la Cité, is a building in which the bodies of unknown persons who have met with a violent death are placed. These, if not claimed within three days, are buried at the public expense. The southern parts of the city are built over beds of limestone, rich in fossils, which have been so extensively quarried as to form a network of vast caverns, which in some cases scarcely afford sufficient support to the houses above. These quarries were converted into catacombs in 1784, and received the bones of the dead collected from the ancient cemeteries of Paris.

Educational Institutions. The institutions for higher education are situated chiefly in the Quartier Latin. The old Sorbonne (q.v.), a large building erected by Cardinal Richelieu for the faculties of the old University of Paris, has been replaced by a magnificent modern building, with fine lecture halls and classrooms and an extensive library open to the public. Near the Sorbonne is the Collège de France, where gratuitous public lectures are delivered by eminent scholars and men of letters. The Ecole Polytechnique, the School of Medicine and the School of Law, the Observatory, and the Jardin des Plantes, with its great museum of natural history, lecture rooms, and botanical and zoölogical gardens, are situated in the same quarter of Paris. See PARIS, UNIVERSITY OF.

The principal of the public libraries is that of the Rue Richelieu, now called the Bibliothèque Nationale, which contains more than 3,000,000 volumes, 105,000 manuscripts, many portfolios of engravings, and a collection of 400,000 coins and medals, which originated in a small collection of books placed by Louis XI in the Louvre. In addition the municipality maintains many branch libraries. No city is richer than Paris in fine-art collections, and among these the museums at the Louvre stand pre-eminent. The Palais or Ecole des Beaux-Arts, the most noted school of art in the world, dating from 1648, covers a large area entered from the Rue Bonaparte, and comprises ateliers or studios of painting, sculpture, architecture, and engraving, a superb library, and collections of paintings and casts. The Hôtel de Cluny, connected underground with the Roman Palais des Thermes, besides being in itself a most interesting monument of mediæval art, contains curious relics of the arts and usages of the French people from the earlier ages of their history to the Renaissance period. The Mint deserves notice for the perfection of its machinery. The Gobelins, or tapestry manufactory, may be in-

cluded under the fine arts, as the productions of its looms are all manual and demand great artistic skill. The Conservatoire des Arts et Métiers, in the Rue Saint-Martin, contains a great collection of models of machinery and classrooms for the instruction of workmen in all departments of applied science. The Palais du Trocadéro is an imposing building, originally erected for concerts and exhibitions in connection with the Exhibition of 1878. Its extensive wings house a permanent collection of casts (see MUSÉE), which now forms a permanent exhibition. Among the numerous learned societies, associations, and institutions the chief are the Académie de Médecine and the Institut de France, the latter housed in the Palais de l'Institut on the Seine at the end of the Pont des Arts. See INSTITUTE OF FRANCE.

Administration. Paris is divided into 20 arrondissements for purposes of administration. The Prefect of the Seine is the chief of the municipal government and is appointed by the national government. There is a municipal council, composed of 80 members, four from each arrondissement, chosen by popular election. Each arrondissement has a mayor and three assistants, all appointed by the President. The arrondissement is the unit of municipal organization for all administrative purposes. It registers all the births and deaths within its boundaries; keeps the registration lists of voters and jurors; attends to the assessment and collection of all taxes; receives application for licenses and privileges; serves as an agency in floating municipal or state loans; administers the schools and libraries; and forms the local centre for all modes of charity work. The whole work of the municipal administrative machine is greatly facilitated by the admirable system of civil service regulating all the appointments and promotions of city officials. The prefect of police is at the head of the civic guard or *gendarmes*, the fire brigade, and the *gardiens de la paix*, or city police, who are armed with swords.

Paris has an abundant water supply, which comprises a supply for domestic purposes and a separate supply for industrial purposes, street cleaning, etc. The chief sources are the Seine, the Canal d'Ourcq, the Marne, the Dhuis, and a vast natural reservoir underlying the Paris basin; the latter is tapped by artesian wells, the most famous of which is the well of Grenelle, 1800 feet deep and surmounted by a tower 108 feet high. The cleaning, sewerage, and water supplies are under the charge of the prefect. The sewerage system is admirable; the total length of the underground channels is over 646 miles, and they are kept so clean and well ventilated that an hour's excursion through the sewers or *égouts* is one of the ordinary experiences of visitors to Paris, the journey being made partly in boats and partly by electric trolleys. Paris has a sewage farm, 5 miles from the city limits (in the Saint-Germain Forest), which has proved a success agriculturally without in the least injuring the health of the community in that region. The paving of the city leaves nothing to be desired, and the street lighting is admirably carried out by means of electric and gas lights furnished by private companies, as explained below.

The administrative tendency in Paris is for municipal ownership of all works supplying public wants and directly affecting public health.

The Conseil d'Hygiène et de Salubrité, or

Board of Health, is composed of men known for their high attainments in science, and includes physicians, city engineers, and men whose technical training enables them best to deal with sanitary problems. Within the scope of its work come not only cases of disease and epidemics, but also the sanitary regulation of workshops, schools, and dwellings, prevention of adulteration of food; sanitary aspects of the water supply; drainage; and cemetery management. In addition to that central body there are 20 commissions d'hygiène, one for each arrondissement, and a commission des logements insalubres, composed of physicians, architects, and engineers, whose duty it is to pass upon the sanitary conditions of dwellings; they can recommend sanitary improvements or condemnation of houses, and their recommendations are as a rule favorably acted upon by the municipal council. There is a special service of sanitary police which enforces all the health laws.

In addition to the activities enumerated above the municipality owns all markets, cattle yards, and slaughterhouses, from which it derives a considerable income. The municipal markets and abattoirs facilitate the inspection of the meat supply, and the municipal laboratory has done a great deal in checking adulteration of milk, bread, wine, and other food of common use, and has served greatly to reduce the death rate.

The poor relief is organized in Paris on a large scale and centralized in the hands of a special department called L'Assistance Publique à Paris. This has charge of the hospitals, of the homes and asylums for aged poor as well as for friendless children, and of outdoor relief. The department is under the authority of the prefect and is governed by a director and a board composed of leading men from various government departments. The work is carried out in detail by the bureaux de bienfaisance, one in each arrondissement, which are composed of persons familiar with the people in their respective districts. The city comes to the aid of the poor in several other ways. There are a number of municipal lodging houses open to unemployed workmen free of charge and furnishing a meal to each guest. A similar home exists for working women. From 15,000 to 20,000 families are helped each year by advance of rent money in cases of threatened eviction. An agricultural colony has been established not far from the city for those unable to make a living. A free employment office is maintained by the city in each arrondissement, and a central labor exchange known as the Bourse du Travail was erected by the municipality in 1892 at a cost of 2,000,000 francs. In addition the municipal council votes 50,000 francs annually for the maintenance of the institution, which serves as the headquarters of all the trade-unions in the city. A public pawnshop (Mont-de-Piété) has been in existence for more than a century. It advances loans in any amount at 6 per cent, which is a great accommodation for the poor. The largest of the numerous hospitals or almshouses is La Salpêtrière (for women), probably the largest asylum in the world, extending over 78 acres of land; 1300 of its 4500 inmates are insane. Bicêtre, with nearly 3600 beds, receives only men. The Hospice des Enfants Trouvés, or foundling hospital, provides for the infants brought to it till they reach the age of maturity, and demands payment only in the event of a

child being reclaimed. The crèches, or public nurseries, first established in 1844, of which there are now 18, receive the infants of poor women for the day at the cost of 20 centimes. Besides institutions for the blind, deaf and dumb, convalescents, sick children, etc., Paris has 17 general and special hospitals. Of these the oldest and most noted are the Hôtel Dieu, La Charité, and La Pitié.

Education. The educational facilities of Paris are very complete. A system of kindergartens called Ecoles Maternelles is provided for children between the ages of 3 and 7, and although attendance there is not compulsory, they are all patronized, as they are a great help to the poor. The attendance is very close to 70,000. Next follow the Ecoles Infantines, which are a transition from the kindergarten to the primary school and are open to children between 6 and 8. The primary schools for children below the age of 14 employ nearly 3000 teachers, half of them men and half women, and are attended by 170,000 pupils. The school system is under the joint supervision of the municipal council, the prefectural administration, and the national Ministry of Education. The children are supplied with textbooks, etc., and those unable to pay (60 per cent of the total number) are given gratis one meal each day. A new feature of the school system is the boarding school for children of widowers or guardians unable to give proper care to their children. The cost of boarding and clothing a child has been fixed at 600 francs a year, but since 1892 the payment has been reduced to 120 francs for those unable to pay more, the city paying the remainder. Upon the completion of the primary school a child is free to enter either a high school or a professional school.

Finance. The maintenance of so many institutions involves, naturally, a great annual expense, and their municipalization has required the contraction of large loans. The budget of Paris for 1911 showed revenue of 380,930,325 francs and expenditure of 378,809,580 francs. The larger estimated disbursements were municipal debt, 127,600,000 francs, charity and health, 63,500,000; police, 42,300,000, education, 28,500,000, streets, 25,000,000. The municipal debt at the beginning of 1911 stood at 2,724,000,000 francs. Taxes in 1911 amounted to about 116,800,000 francs. There are several sources of income from the various companies holding franchises. Paris does not own its water works nor the gas and electric plants, and has no municipal transit system. The gas company, in addition to furnishing gas for the illumination of the streets and public buildings at cost price, pays 200,000 francs a year for the right to lay its pipes and a tax of 2 francs for every 100 cubic meters of gas it sells, and divides with the city all its profits above 13½ per cent on its capital stock, which it is not allowed to increase. There are similar arrangements with water and electric-lighting companies and markets, abattoirs, and cemeteries. Revenue from gas companies in 1911 amounted to 24,300,000 francs, and from water companies to 26,500,000 francs.

Transportation. The main means of intra-mural communication is supplied by the omnibuses and electric tramways, the latter are in a great measure supplanting the former. Motor omnibuses have been in use since 1906. The comprehensive system of electric municipal

tramways, in large part underground and not yet completed, had in 1911 a length of 48½ miles. One of the lines supplements the old surface steam belt railway that passes around the city just inside the fortifications. The cab service in Paris is unexcelled, motor cabs are numerous. The steamboats on the Seine are well patronized in pleasant weather.

Industry and Trade. Paris is the largest industrial centre of France. It has a world-wide renown for the elegance and taste of its products. There are comparatively few large industrial undertakings, Paris being more of a centre of small workshops employing highly skilled labor. Of late, however, a tendency has been noticed towards large establishments. Large factories are found in such industries as the manufacture of machinery, railroad supplies, chemical products, soap, dyes, beer, china, porcelain, leather, etc. Small workshops, however, predominate in the production of clothing, gold and silver articles, furniture, optical and surgical instruments, toys, paper boxes, steel and aluminum articles, artificial flowers, perfumes, articles of luxury, gloves, etc. In all these products Paris excels the world. The book-publishing business of France is almost wholly concentrated in Paris. As a trading centre Paris stands at the head of the list of French cities. The products of its industry, most of which are exported, are valued at more than 3,000,000,000 francs annually. It was among the first cities of the world to introduce large department stores such as the Louvre, the Bon Marché, and Printemps. The most important financial institutions are the Banque de France, the Crédit Foncier, the Crédit Lyonnais with 22 branches in the city, and the Clearing House, called Chambre de Compensation de Banquiers. And there is the Bourse de Commerce in addition to the Bourse de Travail.

Population. The population of Paris varied little from the thirteenth to the sixteenth century, ranging during that period from about 200,000 to about 260,000. In 1637 the number of inhabitants was about 415,000, in 1680, 500,000, in 1718, 509,000, in 1801 (the first census), 547,756, in 1817, 713,966, in 1831, 785,862, in 1851, 1,053,262, in 1861 (after the annexation of several suburbs), 1,696,141, in 1872, 1,851,792, in 1881, 2,269,023, in 1891, 2,447,957, in 1901, 2,714,068, in 1906, 2,763,393, in 1911, 2,888,110. In 1911 the density of population was 149.9 per acre, in 1911 the density in the administrative County of London (with an area of 74,816 acres and a population of 4,521,685) was 60.4 per acre. The most densely populated arrondissement is the third (Temple), which in 1906 had 300 persons to the acre, next in order were the eleventh (Popincourt), 260, the second (Bourse), 253, the ninth (Opéra), 226, the least densely populated was the sixteenth (Passy), with 75 per acre. Nearly 8 per cent of the inhabitants are foreigners, and only about 38 per cent were born in the Department of Seine. In respect of religion the people are predominantly Roman Catholic, there are about 90,000 Protestants and 50,000 Jews.

History. The earliest notice of Paris occurs in Julius Caesar's *Commentaries*, in which it is described, under the name of Lutetia, as a collection of mud huts, composing the chief settlement of the Parisii, a Gallic tribe conquered by the Romans. The ruins of the Palatium Thermarum (Palais des Thermes) and of ancient altars,

aqueducts, and other buildings show that in Roman times the town extended to both banks of the Seine. Christianity was introduced about 250 A.D. by St. Denis. In the fourth century Lutetia began to be known as Parisii, or Paris. In the sixth century Paris was chosen by Clovis as the seat of government, and after having fallen into decay under the Carolingian kings, in whose time it suffered severely from frequent invasions of the Northmen, it finally became in the tenth century the residence of Hugh Capet, the founder of the Capetian dynasty, and the capital of the French monarchy. From this period Paris continued rapidly to increase, and in two centuries it is said to have doubled in size and population. In the Middle Ages Paris was divided into three distinct parts—La Cité, on the islands; the Ville, on the right bank; and the Quartier Latin, or University, on the left bank of the river. Louis XI did much to enlarge Paris and to efface the disastrous results of its hostile occupation by the English during the wars under Henry V and Henry VI of England. Its progress was again checked during the wars of the last of the Valois, when the city sustained several sieges. On the accession of Henry of Navarre in 1589 a new era was opened for Paris. The improvements commenced under his reign were continued during the minority of his son, Louis XIII. Louis XIV converted the old ramparts into public walks or boulevards, organized a regular system of police, established drainage and sewerage works, founded hospitals, almshouses, public schools, scientific societies, and a library, and thus gave to Paris a claim to be regarded as the focus of European civilization. The terrible days of the Revolution (see FRENCH REVOLUTION) caused a temporary reaction. The improvement of Paris was commenced on a new and grander scale under the first Napoleon, when new quays, bridges, markets, streets, squares, and public gardens were created. All the treasures of art and science which conquest placed in his power were applied to the embellishment of Paris, in the restoration of which he spent more than \$10,000,000 in 12 years. His downfall again arrested progress, and in many respects Paris fell behind other European cities.

Renovation of various sorts was recommenced under Louis Philippe, under whom fortifications on a colossal scale were constructed, but it was reserved for Napoleon III to render Paris the most commodious, splendid, and beautiful of modern cities. When he commenced his improvements Paris still consisted, in the main, of a labyrinth of narrow, dark, and ill-ventilated streets. With the assistance of Baron Haussmann, the Prefect of the Seine, his schemes were carried out with rare energy and good taste. Two straight and wide thoroughfares, parallel to and near each other, were made to traverse the whole width of Paris from north to south, crossing the Cité; a still greater thoroughfare was made to run the whole length of the town, north of the Seine, from east to west. The old boulevards were completed so as to form outer and inner circles of spacious streets, the former chiefly lying along the outskirts of the old city, the latter passing through and connecting a long line of distant suburbs. In the year 1867, when the international exhibition was opened, Paris had become in all respects the most splendid city in Europe, and in that year it was visited by upward of 1,500,000 foreigners. Many further improvements were contemplated, but finan-

cial and political difficulties supervened (see FRANCE), and these great schemes had to be postponed. The siege of Paris by the Germans, which lasted from Sept. 19, 1870, to Jan. 28, 1871, caused much less injury to the city than the vandalism of the Red Republicans, who rose against the government in March, 1871, took possession of Paris, and proclaimed the Commune (q.v.) the only lawful government. Acts of pillage and wanton destruction followed. The column erected to the memory of Napoleon and the Great Army in the Place Vendôme, one of the principal squares of Paris, was pulled down as "a monument of tyranny." When the government troops under Marshal MacMahon pressed forward into the city, in the latter part of May, the Communards began systematically to set fire with petroleum to a great number of the chief buildings of Paris, public and private. The fire for a time threatened to destroy the whole city. It was not checked until property had been lost to the value of many millions of dollars and historical monuments were destroyed which never can be replaced. Two years later, however, all the private houses burned had been rebuilt, the monuments only partially injured had been restored, and the streets and public places were as splendid and gay as in the best days of the Empire. The Universal Expositions of 1878, 1889, and 1900 are among the chief events of subsequent history. Paris was the objective of the first German campaign in the European War which broke out in 1914. The Germans were halted by the battle of the Marne when only 30 miles from the city. Several times Paris was bombarded by German air craft. See WAR IN EUROPE.

PARIS. A town in Brant Co., Ontario, Canada, on the Grand River, and on the Grand Trunk, Lake Erie, and Northern, and the Grand Valley Electric railways (Map: Ontario, E 6). The town has a public library. Its manufactured products include alabastine, flour, woolen cloth, knit goods, bricks, and agricultural implements. Gypsum and brick clay are found in the vicinity. The town owns its electric lighting and water works. Pop., 1901, 3229; 1911, 4098.

PARIS. A city and the county seat of Edgar Co., Ill., 19 miles northwest of Terre Haute, Ind., on the Cleveland, Cincinnati, Chicago, and St. Louis and the Vandalia railroads (Map: Illinois, J 6). It is mainly a residential place and has a children's home, Carnegie library, and a public park of 100 acres, 70 of which are now submerged, forming an artificial lake. The city is in a farming district, the products of which form the staples of a considerable trade. There are extensive manufactures of brooms and a large interurban car factory. The commission form of government was adopted in 1915. The municipality owns and operates the water works and also an electric-light plant. Pop., 1900, 6105; 1910, 7664.

PARIS. A city and the county seat of Bourbon Co., Ky., 113 miles by rail east of Louisville, on Stoner Fork of the Licking River, and at the junction of divisions of the Louisville and Nashville and the Frankfort and Cincinnati railroads (Map: Kentucky, F 3). It has a handsome courthouse, a hospital, and a Carnegie library. Situated in the famous "blue-grass

region" of Kentucky, Paris is engaged extensively in breeding fine horses. It is an important railway centre and has a large trade in whisky, tobacco, hemp, grass seed, etc. Paris was settled in 1784 and was chartered as a city in 1862. Pop., 1900, 4603; 1910, 5859.

PARIS. A town and the county seat of Oxford Co., Me., 24 miles from Auburn (Map: Maine, B 4). It has an imposing group of county buildings and a soldiers' monument. The manufacture of wood novelties constitutes the chief industry. Paris owns its water works. Pop., 1900, 3225; 1910, 3436.

PARIS. A city and the county seat of Henry Co., Tenn., 119 miles by rail west of Nashville, on a fork of the West Sandy River, and on the Louisville and Nashville and the Nashville, Chattanooga, and St. Louis railroads (Map: Tennessee, B 2). It is the centre of a fertile region, producing cereals, cotton, fruits, and tobacco, and has several tobacco, perfume, and medicine manufactures, planing mills, flouring mills, and repair shops of the Louisville and Nashville Railroad. The water works and electric-light plant are owned by the city. Pop., 1900, 2018; 1910, 3881.

PARIS. A city and the county seat of Lamar Co., Tex., 98 miles northeast of Dallas, on the Texas and Pacific, the Texas Midland, the St. Louis and San Francisco, the Gulf, Colorado, and Santa Fe, and the Paris and Mount Pleasant railroads (Map: Texas, E 3). It has fine United States court and post-office buildings, a county courthouse of granite, St. Joseph's Infirmary, the W. B. Aikin Charity Hospital, the Sanitarium of Paris, and a fine Country Club. The city is the centre of a productive cotton-growing region and controls extensive wholesale and shipping interests. Its industrial establishments include large cottonseed-oil mills, a large compress, cotton gins, a flouring mill, handle and crate factories, a box factory, a furniture factory, brick plants, etc. Paris, settled in 1841, is governed under a charter of 1905, which provides for a mayor, elected every two years, and a council, elected at large. The water works are owned and operated by the municipality, as is the abattoir, the first municipally owned and operated in America. Pop., 1900, 9358; 1910, 11,269; 1914 (U. S. est.), 12,081.

PARIS (Lat., from Gk. Πάρις, of unknown etymology), known also as ALEXANDER. In Greek legend, the second son of Priam, King of Troy, and Hecuba, and cause of the Trojan War. Before his birth his mother dreamed that she gave birth to a firebrand which set the whole city on fire, a dream interpreted by Helenus or by Cassandra to signify that the child she was about to bear would bring the city to destruction. To prevent this, Priam caused the infant to be exposed upon Mount Ida, where he was found and brought up by shepherds, among whom he distinguished himself. After a time he accidentally discovered his origin and was received by Priam as his son, but continued to live on Mount Ida, where he had won the love of the nymph Cénone, daughter of the river god Cebren. While on Ida he was appealed to as umpire in a strife which had arisen among the three goddesses, Hera, Athene, and Aphrodite, as to which of them was the most beautiful, the goddess Eris (strife) having revengefully flung among them at the marriage of Peleus, to which she had not been invited, a golden apple (of discord) inscribed *To the Most Beautiful*. Each of

the three endeavored to bribe Paris. Hera promised him dominion over Asia; Athene, military renown; Aphrodite, the fairest of women for his wife, Helen, the wife of Menelaus. Paris decided in favor of Aphrodite; hence the animosity which the other two goddesses displayed against the Trojans in the war that followed. Paris now equipped a ship and sailed to Sparta, where, with the aid of Aphrodite, he persuaded Helen to elope with him to Troy. Upon this followed the Trojan War, in which the princes of Greece joined Menelaus in his endeavor to recover his wife. In the *Iliad* Paris is at times represented as a cowardly boaster, disliked by his countrymen, while in other portions of the poem he is valiant and skillful in battle, especially with his bow, and is welcomed on his appearance by the Trojans. His manly beauty is more than once praised. In the epic he was said to have killed Achilles, while the latter was trying to force his way through the Scæan gate into Troy, but the later writers elaborated the story of Achilles' love for Polyxena and represented the Greek hero as enticed to the temple of Apollo and there murdered by Paris and Deiphobus. The *Little Iliad* told of the death of Paris by the arrow of Philoctetes, who owned the bow and arrows of Heracles. The Alexandrian writers, to whom the Cnemon episode is due, added the version that when Paris was wounded by the poisoned arrow he turned for healing to his old love on Mount Ida. She, however, refused to employ her magic skill, and the hero died, whereupon in remorse she destroyed herself. Representations of Paris are common in ancient art. On the earlier vases he appears at the judgment of the goddesses as a shepherd, often with the lyre and amid his flocks. Later he is usually distinguished by the Phrygian cap and sometimes by the close-fitting trousers and jacket worn by Asiatics.

PARIS, DECLARATION OF. See DECLARATION OF PARIS.

PARIS, *pâ'rēs'*, (GASTON (1839-1903). A French philologist. The son of Paulin Paris, he was born at Avenay, Aug. 9, 1839. He studied Romance philology for two years at Göttingen and Bonn, where he was for a while associated with the illustrious founder of modern Romance philology, Friedrich Diez. Having gone back to France, he worked at the Parisian Ecole des Chartes (1858-61) and became director of the Ecole des Hautes Etudes. He gave to his department of it such fame that students came to him from all parts of the world. He was also soon associated with the work in the Collège de France, and succeeded to the chair of his father when the latter retired in 1872. He was one of the staff of the *Revue Critique* from 1866 to his death, and in 1872 with his lifelong fellow worker, Paul Meyer, he founded the *Romania*, one of the most important of the Romance journals. In collaboration with Brachet (q.v.) and Morel-Fatio he translated the *Grammaire des langues romanes* of Diez (1874-78) and contributed extensively to the *Histoire littéraire de la France*. In 1895 Professor Paris was made director of the Collège de France, and in 1896 he was elected to the French Academy. He had become a member of the Institute in 1876. In 1889 his Swedish pupils issued a *Recueil de mémoires philologiques* (Stockholm) in honor of

his fiftieth birthday, while the following year a similar publication entitled *Etudes romanes* (Paris, 1891) was brought out by his French and foreign students on the occasion of the twenty-fifth anniversary of his doctorate. Since Sainte-Beuve, who gave little attention to linguistics, the French nation had had no critic so great as Gaston Paris. In him the philologist and the lover of beauty were at one. Reared as he was among literary men, towards the end of his life he was at the head of scientific literary criticism in France. He had no showy theories, but his discoveries were many and his knowledge was so wide that other great scholars were loath to assail his views. Yet his influence, which had been won by his steadfastly scientific attitude, and by the moderation, clearness, and charm of his thought, created no doctrinary school. He had rare personal dignity, a keen but sober wit, an extraordinary memory, and a wide acquaintance with men. Paris devoted himself mainly to the language and literature of France. He excelled not only in textual criticism, but in teaching and in arousing a sound love of old literature. In 1902 Paris became head editor of the *Journal des Savants*. He had other great work on hand when he died in Cannes, March 5, 1903, the most famous of Romance scholars, with disciples in all civilized countries. Some of the more important of his productions, besides the manifold articles to be found in the *Romania* and other reviews, are: *Etude sur le rôle de l'accent latin dans la langue française* (1862; new ed., 1896); *De Pseudo-Turpinio* (1865); *Histoire poétique de Charlemagne* (1865; 2d ed., 1905), his doctoral dissertation; *Les contes orientaux dans la littérature française du moyen âge* (1875); *Le petit Poucet et la grande Ourse* (1875); *La poésie du moyen âge* (1885; new ed., 2 vols., 1903-06); *La littérature française du moyen âge* (Paris, 1888; 4th ed., 1907; Eng. trans., London, 1903); *Poèmes et légendes du moyen âge* (1900); *Penseurs et poètes* (1896); *Extraits des chroniqueurs français* (1892; 5th ed., 1902), with A. Jeanroy; *Légendes du moyen âge* (1903). Perhaps his most fascinating work is his biography and literary estimate of François Villon (1901; 2d ed., 1910). Among the notable texts edited by him are the *Vie de Saint Aleais* (1872; 3d ed., 1903), with L. Pannier, and the *Extraits de la chanson de Roland* (1887; 8th ed., 1905); also *Merlin* (2 vols., 1886) and *Les miracles de Notre Dame* (8 vols., 1876-93). In 1909 his literary executor, M. Roques, published a volume of his studies entitled *Mélanges linguistiques*, treating of philological questions, and three years later (1912) edited his *Mélanges de littérature française du moyen âge*. Consult: Todd, "Gaston Paris, Romance Philologist and Member of the French Academy," in *Publications of the Modern Language Association*, vol. xii (Baltimore, 1897); Monod, "Gaston Paris," in *Revue historique*, vol. lxxxii (Paris, 1903); Bédier and Roques, *Bibliographie des travaux de G. Paris* (Paris, 1904); M. Croiset, "Notice sur la vie et les travaux de Gaston Paris," in the *Bibliothèque de l'Ecole des chartes*, vol. lxxv (ib., 1904); Bédier, *Hommage à Gaston Paris* (ib., 1904); W. P. Ker, "Gaston Paris," in the *Fortnightly Review* (London, July, 1904); id., *Essays on Medieval Literature* (New York, 1905); Nyrop, *Gaston Paris* (Copenhagen, 1906).

PARIS, JOHN AYRTON (1785-1856). An English physician and author. He was born

and was educated at Cambridge, where, after pursuing courses of study at Edinburgh, he took his medical degree in 1808. He began the practice of his profession in London, was made physician to Westminster Hospital, and later settled in Cornwall. There he obtained a large practice, studied natural history, and founded the Royal Geological Society of Cornwall. Returning to London, he lectured on *materia medica* and the philosophy of medicine at the Royal College of Physicians. He became a censor of the Royal College of Physicians in 1817, delivered the Harveian oration before it in 1843, and the next year succeeded Sir Henry Hallford in its presidency, retaining that office until his death. Among his works are a *Pharmacologia* (1812; 9th ed., 1843), long the standard treatise on the subject, *Medical Jurisprudence* (1823), a *Treatise on Diet* (1827, 5th ed., 1837); *Philosophy in Sport Made Science in Earnest* (1827, 8th ed., 1856), a popular treatise on physical science, and a *Life of Sir Humphry Davy* (1831).

PARIS, pa'rê', LOUIS PHILIPPE D'ORLÉANS, COUNT DE (1838-94) Pretender to the crown of France. He was born in Paris, Aug. 24, 1838, being the eldest son of Ferdinand, Duke of Orléans, and grandson of Louis Philippe. On the death of his father in 1842 the Count de Paris became the French heir apparent. He was carefully educated in Germany and later in England, whither his mother had removed after the events of 1848. A journey to Syria with his brother, the Duke de Chartres, in 1859, resulted in the publication of a journal of the voyage, entitled *Damas et le Liban*. Early in 1861 the Count de Paris became interested in the Civil War in the United States, offered his services with his brother's to the Federal government, and with their uncle, the Prince de Joinville, the two were attached to the staff of General McClellan, with the rank of captain. They were present at the siege of Yorktown and the battle of Fair Oaks and only retired when the attitude of France towards Mexico gave cause of offense to the United States. The Count de Paris returned to England in the summer of 1862 and shortly afterward began to appear as a contributor to the *Revue des Deux Mondes*, though under a nom de plume. In 1864 he married his cousin Isabella, the daughter of the Duke de Montpensier. In 1871 he was chosen to the National Assembly, which voted that his property in France, confiscated by Napoleon, should be restored. In 1873 the Count de Paris made a formal resignation of the claims of his family to the throne of France by a visit to the Count de Chambord at Frohsdorf, but after the latter's death in 1883 he was generally regarded as the Count de Chambord's successor and as the chief of the Legitimist party. By the Expulsion Act of 1886 the Count de Paris and his family were compelled to leave France. He settled in England and devoted himself to literary pursuits, though occasionally issuing a royal manifesto to the people of France. Of his eight children, the most noteworthy was the eldest, Philippe, Duke of Orléans. (See family article ORLÉANS.) The Count de Paris revisited the United States, where he was well received, in 1890. He died at Stowe House, Buckinghamshire, England, Sept. 8, 1894. Of his writings, the most important are: *De la situation des ouvriers en Angleterre* (1869), which has been translated into English and German, and *Histoire de la*

guerre civile en Amérique (1874-75), an able military history, which has been translated.

PARIS, MATTHEW (c.1200-59). The greatest English historian of the Middle Ages. In 1217 he entered the monastery of St. Albans, where Roger of Wendover (q.v.) was historiographer. When Roger died, in 1236, Paris took up the work of continuing the *Chronica Majora*, which had been brought to the year 1235. Paris evidently enjoyed a wide renown even in his own day, for in 1248 he was specially invited by King Haakon IV of Norway to reorganize the abbey of St. Benet Holm and was ordered by Pope Innocent IV to investigate its spiritual condition also. He returned to England in 1249, laden with presents. With the year 1250 Paris intended to end his chronicle, but new events aroused his interest, and the great work ended only nine years later. An abridgment which he prepared is known as *Historia Minor*, extends from 1067 to 1253, and contains a few incidents not noted in the *Chronica Majora*. In addition Paris wrote the *Vita Abbatis S. Albani* and the *Addamentum*; the latter contains charters, etc., supplementing both the *Chronica Majora* and the *Vita*. He died probably about May, 1259. In his own day Paris was considered a universal scholar and was indeed versed in most of the learning of his time. There is a continuation of his works ascribed to Rishanger (q.v.). All of the works of Paris are published in the *Rolls Series*. For other editions and works connected with Paris, consult: Augustus Jessopp, *Studies by a Recluse* (3d ed., London, 1893); August Potthast, *Bibliotheca Historica Medii Aevi*, vol. II (Berlin, 1896); Hans Plehn, *Politische Charakter Mathæus Parisiensis* (Leipzig, 1897); Charles Gross, *Sources and Literature of English History* (London, 1900).

PARIS, pa'rê's', PAULIN (1800-81) A French historian and philologist, father of Gaston Paris. He was born at Avenay, Marne. His appointment in the manuscript department of the National Library gave him opportunity to study the old French writers. He was made a member of the Academy of Inscriptions (1837), wrote memoirs for its publications and for those of other learned societies to which he belonged, and was professor of mediæval history in the Collège de France (1853-72). His most notable achievement was his catalogue, *Manuscrits français de la bibliothèque du roi* (1836-48). Besides other translations, he made a French edition of Byrón (1830-32-36). He edited the *Grandes chroniques de France* (1836-40) and other works. His own *Études sur François I* (1885) were published posthumously.

PARIS, TREATIES OF. The name given to important treaties of peace concluded at Paris in 1259, 1763, 1783, 1814, 1815, 1856, and 1898.

Louis IX of France appears to have doubted the validity of his title to some of the former possessions of the English princes, and so after 17 years of intermittent discussion the difficulty was settled in a treaty of peace with Henry III. This treaty, named from Abbeville, where the two kings met, and dated May 20, 1259, was in reality negotiated with Earl Simon de Montfort at Paris and concluded with Henry during his visit to France, November, 1259, to April, 1260. By its terms Henry surrendered all claim to Normandy, Touraine, Maine, Anjou, and northern Saintonge; receiving from Louis in return Périgord, Limousin, southern Saintonge, and some other territory south of the Loire, to be

held as fiefs. Henry gave up the titles of Duke of Normandy and Count of Anjou; while as Duke of Guienne and peer of France he agreed to do homage to the French monarch, this engagement being performed in the Garden of the Temple at Paris. The inhabitants of the district ceded to Henry were ill pleased, and in later times they refused to celebrate the saint day of Louis.

The Treaty of Feb. 10, 1763, was concluded between France and Spain on the one hand, and Great Britain and Portugal on the other, at the end of the Seven Years' War (q.v.). It provided for a cession to Great Britain of Canada, Prince Edward Island, Cape Breton, and the region east of the Mississippi River, possessed or claimed by France, except New Orleans and the isle on which it stood. Great Britain was confirmed in the possession of Nova Scotia. France retained a share in the fisheries of Newfoundland and the St. Lawrence, under certain restrictions, together with the isles of Saint-Pierre and Miquelon. In the West Indies Great Britain restored Martinique and Guadeloupe, and ceded St. Lucia to France, while France ceded to Great Britain Dominica, St. Vincent, Grenada, and Tobago (the last previously neutral territory). France ceded Senegal to Great Britain. She recovered possession of Pondicherry, but had to agree not to maintain military settlements in Bengal. In Europe France relinquished her conquests in Germany, restored Minorca, and engaged to maintain the status quo. By way of compensation for the loss of Florida, which Spain ceded to Great Britain, which had fallen into the hands of that Power, France ceded to Spain the bulk of Louisiana, including New Orleans. The effect of the treaty was to establish the supremacy of Great Britain in America, in India, and on the seas.

The Treaty of Paris of Sept. 3, 1783, between Great Britain and the United States, marked the close of the American Revolution and recognized the independence of the Colonies. Simultaneously with its conclusion Great Britain made peace with France and Spain at Versailles. The four difficult questions upon which the British and American negotiators labored at great length before reaching a settlement related to (1) the boundaries of the United States, (2) fishing rights on the coast of Newfoundland, (3) payment of private debts due from Americans to British creditors, and (4) compensation of the Loyalists. As finally concluded, the treaty recognized the Mississippi River as the western boundary from a point west of the Lake of the Woods to the thirty-first parallel of north latitude; thence the boundary was to run due east to the Appalachicola (Chattahoochee) River, thence down the middle of that stream to the Flint River, thence to the head of the St. Mary's River, and thence along the middle of that river to the Atlantic Ocean. The Great Lakes and the St. Lawrence River were recognized as the northern boundary to the forty-fifth parallel. Thence to the Atlantic Ocean the boundary was described as following the highlands which divide those rivers that empty themselves in the St. Lawrence from those which empty into the Atlantic, thence from the highlands to the source of the St. Croix River, and thence down that stream to its mouth. (See NORTHEAST BOUNDARY DISPUTE; also NORTHWEST BOUNDARY DISPUTE.) With regard to the fisheries it was provided that the Americans were to continue to enjoy the same rights of fishery at Newfound-

land and vicinity which they had enjoyed as English colonists, and while they were to be permitted to dry their fish on other unsettled shores, they were not allowed to do so on the island of Newfoundland. At the same time they were to have the exclusive right of fishing on their own coasts. On the third point it was provided that creditors on either side should meet with no lawful impediment to the recovery of the full value in sterling money of all bona fide debts contracted before the war. With regard to the Loyalists, the American negotiators consented that Congress should be asked to recommend to the State legislatures to provide for the restitution of confiscated estates and to abandon all future confiscations and to cease all prosecutions commenced against persons known as Loyalists. The navigation of the Mississippi was declared to be free to the subjects of both nations. By the terms of the Treaty of Versailles, signed on the same day as that of Paris, Great Britain restored Florida and Minorca to Spain and ceded Tobago to France. Senegal was relinquished to France.

The Treaty of Paris of May 30, 1814 (First Peace of Paris), was concluded between France on the one hand and the representatives of all the great Powers of Europe on the other. It provided that France should surrender all her conquests except slight territories on the northern and eastern boundaries, leaving her with the boundaries of 1792. She was to pay no indemnity and was to retain all works of art taken from conquered countries with a few exceptions. Most of the colonies taken from her by Great Britain were restored; Holland was restored to the house of Orange; of the colonial possessions wrested from Holland, Great Britain retained Ceylon, the Cape of Good Hope, and part of Surinam (Guiana); Switzerland was declared independent; Italy, except the Austrian provinces, was to consist of independent states, a similar arrangement was made for Germany; the navigation of the Rhine was to be open; and the settlement of all other questions of European concern was to be entrusted to a European congress to be convened at Vienna. (See VIENNA CONGRESS.) By secret provisions it was agreed that the allies should control the distributions of territory at the congress, that Austria should receive northern Italy, that the King of Sardinia should receive Genoa, and that Belgium and Holland should be united as a defensive territory against France.

The Treaty of Paris of Nov. 20, 1815 (Second Peace of Paris), was concluded between France on the one hand and the allies on the other and materially modified the Treaty of 1814. By this treaty France was deprived of certain small territories to the north and east which she had been allowed to retain by the Treaty of 1814. She was also compelled to pay indemnities to the allied Powers for the expenses of the war, amounting to some £40,000,000; to consent to the occupation of her frontier provinces for a period of five years by an allied army of 150,000 men and to defray the cost of this occupation out of her own revenues. Indemnities to a large amount were allowed several of the allies for the spoils committed on them by the French armies, the total amount of the entire indemnity exceeding £60,000,000.

The Treaty of Paris of March 30, 1856, was concluded among the Powers at the close of the Crimean War (q.v.) and settled a number of

questions of European public law of great importance. It provided that the Black Sea should be neutralized and that it should be thrown open to the merchant marine of every nation. All war vessels of every nation, including Russia and Turkey, were forever prohibited from entering that sea. The Czar and the Sultan agreed not to establish upon its coasts any military fort or arsenal. A portion of Bessarabia was surrendered by Russia, and the river Danube was declared to be open to free navigation. For the purpose of insuring free navigation and for policing and improving the river, it was placed under the supervision of an international commission. This provision was declared to be a part of the public law of Europe. The Sublime Porte was formally admitted to the European concert, and the Powers engaged to respect the independence and integrity of the Ottoman Empire. The Danubian principalities of Moldavia and Wallachia were to continue under the suzerainty of the Porte, Russia renouncing her protectorate over them and the Powers guaranteeing all the privileges and immunities of which they were then in possession. Several important principles of international law were agreed upon at the same time and were embodied in the Declaration of Paris (q.v.).

The Treaty of Paris of Dec. 10, 1898, terminated the Spanish-American War. Spain relinquished her sovereignty in Cuba and ceded Porto Rico, the Philippine Islands, and the island of Guam to the United States, from which she received the sum of \$20,000,000.

PARIS, UNIVERSITY OF. One of the oldest and largest universities in the world. It had its inception in the schools of Notre Dame, Ste. Geneviève, and St. Victor and first comes into prominence about 1170. In the early part of the twelfth century Paris was already the noted seat of a number of great masters, among whom were William of Champeaux and his pupil Abélard (q.v.). Thousands of scholars from all over Europe flocked to Paris. Hence arose the necessity for common protection against the impositions of citizens and particularly against the chancellor of Notre Dame, who possessed the right to grant the "license to teach" and thus constituted the quasi head of the university, and from a mere association of masters there gradually developed a corporation with special rights and privileges. In 1200 Philip Augustus granted a charter conceding among other privileges the right of students to be tried in an ecclesiastical court. In 1207 there is mention made of *Comunitas Scholarium* and *Universitas Magistrorum*, indicating a fully organized Studium Generale. The chancellor's power to grant licenses was somewhat neutralized by the custom of Inception, which obliged a candidate to deliver an inaugural address before being permitted to associate with the masters. In 1229 a bloody fight between students and citizens caused an emigra-

tion which greatly benefited Oxford. Two years later, however, Pope Gregory IX came to the assistance of the university, and masters and scholars returned in large numbers. Popes Honorius III and Gregory IX, by siding with the masters in these disputes, acquired an enormous influence over the affairs of the university. The corporation, which at first was nothing more than an association of masters, now consisted of masters and scholars, although the right to vote was vested in the masters only. The university was divided into the superior faculties, viz., theology, medicine, and law, and the inferior faculty of arts. However, on account of the predominance of their number the rector of the faculty of arts became practically the head of the university in the fourteenth century. The arts faculty was divided into four nations: French, Picards, English, and Normans. In the congregations of the university there were seven voices, the nations controlling four and the other faculties three. In the middle of the thirteenth century the university entered into a series of litigations with the aggressive Mendicants, who included among their teachers such men as Thomas Aquinas, Alexander of Hales, and St. Bonaventura. They established three chairs in theology without taking the oath of obedience to the university statutes. After a struggle of seven years the Pope decided against the masters, and the Mendicant scholars were placed on a basis of equality with the seculars. The contest with the Mendicants, however, was fortunate in that a series of "colleges" or foundations modeled after those of the orders where laymen could get lodging, care, and instruction were established. The most famous of these were the Sorbonne (q.v.), founded by the Robert de Sorbon about 1257, and the College of Navarre.

In the fourteenth and fifteenth centuries the university attained its highest stage of development. Prince and popes courted its favor and followed the teachings of its famous theologians and jurists. It became the centre of the educated world. However, its conservative attitude towards the humanism of the fifteenth century; the civil wars; the constantly increasing centralization of the French government, which crippled free university life—all contributed towards the gradual decline of its fame. The theological faculties, owing to the establishment of the bishop seminaries, lost their prestige as educational institutions and degenerated into mere degree-conferring bodies. The famous jurists also forsook Paris for the practical business of administration in the provinces. The faculties of arts and the colleges came to serve the purposes of secondary education, while most of the higher education fell into the hands of the Jesuits, who established a number of colleges in France. The university never flourished again as during the mediæval period. Henceforth the great scholars of France were connected with the Academy. During the Revolution the university went down with the rest of the French universities. In 1808 Napoleon reorganized it as part of the University of France, and until 1896 it was known as the *Facultés de Paris*. In 1914 it consisted of the following faculties, school, and administrative body: (1) the conseil de l'université; (2) the Protestant theological faculty; (3) the medical faculty, including the Musée Dupuytren, established in 1835; (4) the law faculty; (5-6) faculties of science and letters at the Sorbonne; (7) the school of

pharmacy. The total attendance in 1912-13 was 17,556. The libraries contained about 900,000 volumes and more than 2300 manuscripts. Consult: Jourdain, *Histoire de l'université de Paris au XVII^e et au XVIII^e siècle* (Paris, 1862-66); Budinszky, *Die Universität in Paris und die Fremden an derselben im Mittelalter* (Berlin, 1876); Denifle and Chatelain, *Chartularium Universitatis Parisiensis* (Paris, 1889 et seq.); C. F. Thwing, *Universities of the World* (New York, 1911). See UNIVERSITY.

PARIS BASIN. A geologic basin eroded in the Cretaceous rocks of the vicinity of Paris and subsequently filled with Tertiary marls and sands. The basin occupies an oblong area of about 20,000 square miles, which is divided by the Seine into a northern and a southern half. The underlying strata are chiefly remarkable for the rich harvest of organic remains which they supplied to Cuvier, and which led to the foundation of the modern science of paleontology.

PARIS GREEN, SCHWEINFURTER GREEN, or EMERALD GREEN. A double compound formed by the union of copper acetate and copper arsenite. Its composition may be represented by the formula $(C_2H_3O_2)_2Cu.(AsO_3)_2Cu$. It is insoluble and, as one of its names indicates, has an emerald-green color. It was formerly much used as a pigment, especially for wall paper, but its use has been largely discontinued on account of its exceedingly poisonous nature. It is used as an insecticide (q.v.).

PARISH (OF. *parosse*, *paroiche*, Fr. *paroisse*, from Lat. *paracia*, *parochia*, from Gk. *παροικία*, *paroikia*, ecclesiastical district, from *παροικος*, *paroikos*, neighboring, from *παρά*, *para*, beside, beyond + *oikos*, *oikos*, house). A division either of territory or population, originally ecclesiastical, but in some places also civil. The word in its Greek form was applied in its earliest ecclesiastical use to a body of Christians living in a city and its neighborhood to distinguish them from the other inhabitants. Gradually it came to mean the district under the care of a bishop, then the divisions of the district in charge of resident presbyters. The subdivision of the dioceses of the kingdoms of England into what are now known as parishes is not supposed to have taken place much earlier than the time of King Edgar (970), the boundaries of the parishes being fixed by those of manors. In this later ecclesiastical sense the parish came to be the territory committed to the charge of one priest. But since the modern development of the English poor laws the term "parish" in the statutes defines a district for which a separate poor rate is or may be made and a separate overseer appointed. On the temporal side the administration is in the hands of the vestry and especially of the churchwardens, one of whom is usually nominated by the incumbent, the other elected by the ratepayers. Their duties are to have a care for the fabric of the church and other property, preserve order during divine service, and provide whatever is necessary for its due celebration. There has for many centuries been an apparent confusion in the use of the term, arising from the fact that, as a rule, the same body of individuals represented both the civil and the religious organizations. From an early period, however, the ecclesiastical side of the parish has predominated over the civil side, and this was the condition of affairs at the time of the first English settlements in America. It was in Virginia that the parish as it existed

in England was developed, although, on account of the peculiar circumstances of the colony, it came later than the military and civil divisions and therefore never possessed civil powers equal to the parishes of the mother country. The word "parish" was used in the New England Colonies to denote the township from the ecclesiastical point of view as well as a portion of a township not possessing town rights. In the United States at the present time the word "parish" as an ecclesiastical district is used loosely by the Episcopal and Reformed Episcopal churches and often with a more definite territorial limitation by the Roman Catholic church. In the Episcopal church the parish is the local unit of organization and, as a rule, possesses a corporation composed of the rector, wardens, and vestrymen. The term is used generally in churches either for the district within which the adherents of the church reside or for the legal ecclesiastical organization. In Louisiana the term "parish" is given to the civil territorial divisions called counties in other States.

PARISH-ALVARS, pā'rish-āl'vārz, ELIAS (1808-49). An English harpist and composer, born at West Teignmouth. He studied under Dizi, Labarre, and Bochs, after 1831 toured in concert over much of Europe and the East, and in 1847 became Imperial chamber harpist at Vienna. His compositions, ranking among the best for the harp, include the collection *Voyage d'un harpiste en Orient*, two harp concertos, a *concertino* for two harps and orchestra, characteristic pieces, fantasias, and romances.

PARISH CLERK. An officer in the parishes of the Church of England and in some of the colonial churches of the Anglican communion. It is the duty of a parish clerk to represent the congregation in public worship. Formerly clerks in holy orders were appointed, but now a clerk is usually a layman, who by the canon law is required to be at least 20 years of age and of competent skill to perform his office.

PARISH SCHOOL. A term applied to institutions located in the district called the parish.

In the capitulary of 789 Charles the Great directed every monastery to have its school where boys might be taught the Psalms, the system of musical notation, singing, arithmetic, and grammar. Such schools would, of course, reach only a very little beyond those designed for the Church, but in 796 Theodulphus, Bishop of Orléans, issued a similar capitulary to the clergy of his diocese, requiring them to give gratuitous instruction to the children of the laity in every town and village. From time to time other decrees by both church and state attempted to render more effective the popular instruction that the clergy of France were supposed to give. After the revocation of the Edict of Nantes (1685) Louis XIV decreed that there should be in every parish a school to teach the Roman Catholic religion, reading, and even writing. The Brethren of the Christian Schools, founded in 1679 by La Salle, a canon of the cathedral church at Rheims, afforded a most effective means of education for the common people.

The early Protestant reformers—Luther, Melancthon, Zwingli, Knox, and others—were anxious that the common people should have proper religious instruction, and to this end they deemed the rudiments of reading and writing of the greatest importance. They urged upon

the pastors the duty of attending to this matter, and the early Protestant parish schools either were taught by the pastors or their assistants or were at least under their supervision. As the schools were taken in hand by the state, ecclesiastical supervision was retained, and it has been done away with very slowly, vestiges of it remaining in Prussia even to-day. See **PARISH**.

PARISINA, pā-ré-zō'nā. An opera by Mascagni (q.v.), first produced in Milan, Dec. 15, 1913.

PARISIUS, pā-ī'sē-ūs, LAUDOLF (1827-1900). A German politician and author. He was born at Gardelegen, studied law at Halle, and practiced in his native town. In Berlin he became prominent in the politics of the Progressist party as an editor of the *Parlamentarische Korrespondenz aus der Fortschrittspartei* and a member of the Prussian House of Deputies. Afterward he joined the National Liberal party and sat in the Reichstag in 1874-77 and 1881-87. In 1871 he was made conspicuous by his attacks on Von Mühler, Minister of Education. Consult his *Ein preussischer Kulturminister der seinen Beruf verfehlt hat* (15th ed., 1871). He wrote various legal commentaries; a valuable history, *Deutschlands politische Parteien und das Ministerium Bismarcks* (1877), several legal works; the biography *Lieopold Freiherr von Hoyerbeck* (1897-1900); and several novels.

PARJANYA, pār-jūn'ya. In the Veda (q.v.), the rain god. He is mentioned about 30 times in the Rig-Veda, where he is celebrated in three hymns. His action, however, is not wholly independent, as he, like the Maruts, is subject to Mitra and Varuna (q.v.). Parjanya, as being a rain deity, is frequently associated with thunder and occasionally also with lightning. It naturally follows from his functions that he is in a special degree the god who promotes and fosters vegetation. His wife is by implication the earth, although one passage of the Atharva-Veda expressly calls her name Vasa. Parjanya is mentioned in connection with several other deities, especially with Vata, the wind, and less often with the Maruts, the storm gods, and with Agni, the fire. He has likewise many points of resemblance with Indra (q.v.), with whom in the epic he is regularly identified. Parjanya is often thought to be identical with the Lithuanian thunder god Perkūnas, but this view must be regarded as more inviting than probable. Consult A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897), and id., *History of Sanskrit Literature* (London, 1913).

PARK (ME. *park*, *parrok*, from OE. Fr. *pare*, and from AS. *pearroc*, OHG. *pfarrich*, Ger. *Pferch*, park, of uncertain etymology, possibly connected with provincial Eng. *par*, inclosure for domestic animals, and with OHG. *sparro*, Ger. *Sparren*, Eng. *spar*). In English law, an inclosed area of forest land containing "wild beasts of the chase," particularly deer. The

right to hunt in a park was a prerogative of the crown and could be gained by a subject only by royal grant or by prescription. When so acquired it was a franchise and was alienable and usually inheritable like other real property. See **FOREST LAWS**; **GAME LAWS**.

PARK. A tract of land, however large or small, which is devoted to public use and enjoyment. Its object is threefold: adornment, the collection and nurture of plants and animals, the enjoyment of the people. Under this definition any open space set apart for rest or recreation is a park, whether it be as formal as Versailles, as picturesque as Fontainebleau, or as wild as the Yosemite valley. Even grass may be omitted, and yet the park remains, as in the Tuileries at Paris, where the entire surface not occupied by pavements, groups of shrubs, or parterres of flowers, is covered with loose gravel, through which water percolates to the tree roots, and over which there is no restraint of popular use.

A park may be controlled by a city, by a number of adjoining cities acting together as a district, by a state, or by a nation. City parks include city squares, commons, botanical and zoological gardens, parkways and boulevards, and frequently public playgrounds. (See **PLAY-GROUNDS AND RECREATION CENTRES**.) In recent years, under the inspiration of the city-planning (q.v.) movement, there is a growing tendency to develop these different forms of city parks according to a definite and well-worked-out plan, broad enough in its scope to provide for the needs of a city's population for rest and recreation in the open air.

The practice, however, of reserving public parks for the use and delight of the people is as old as civilization. The Egyptian parks were small and formal, ornamented with colonnades and other architectural features. Very different were the parks of the Assyrians and later Persians, who reserved and lavishly decorated vast areas of mountain. Greek parks were small and formal, like those of the Egyptians. In Rome in the time of the Caesars there were, according to Lanciani, eight camps or commons, and 30 parks belonging to the city, of which the most extensive was the Campus Martius. During the Middle Ages public parks were little thought of, but during the Renaissance many beautiful public parks and gardens were laid out which are still the ornament of many European cities. The history of the defense of the cities of mediæval Europe explains the location of many of their parks. Nearly every town formerly had its wall and surrounding ditches and reserve of open ground outside kept clear for military defense, all belonging to the state. These walls and adjacent grounds, before as well as after the fortifications were razed, were the promenades of the people, and in modern times have been converted into parks and boulevards. Towns which have grown greatly have had several successive circles of inclosing fortifications, thus providing, as in Paris and Vienna, a series of concentric rings of public promenades, boulevards, and commons.

The area of parks in London is proportional to the immensity of the city. Its seven great parks are Hyde Park, containing about 400 acres, intersected by walks and carriage roads (including the famous saddle-horse road called Rotten Row), clothed with old forests and graced by the lake called Serpentine; Kensington

Gardens, an adjoining royal park of about 240 acres, farther from the city; Green, a smaller pedestrian park, by which Hyde Park may be approached; Regent's, nearly circular, with 472 acres, and having zoological and botanic gardens; Victoria Park, with 217 acres; Battersea Park, 200 acres; Kennington Park, 20 acres. These are almost exclusively for pedestrians as well as the great Botanic Gardens of Kew outside of London. Paris is noted for the elegance and great number of its small parks and avenues for promenades. The Bois de Boulogne, an ancient wood belonging to the crown, was given to the public about 1852. It contains 2250 acres. Carriage drives and promenades traverse it in every part, and four artificial lakes are its most interesting feature. The old gardens of the Tuileries, already alluded to, and the gardens of the Luxembourg are so completely enjoyed by the public that they fill all the uses of parks. Paris is provided with park resorts outside of the city to a greater extent than any other city. All the old chateau forests and hunting grounds of successive kings of France are now the property of the state and furnish attractions in every direction from the city. Saint-Cloud, Versailles, Vincennes, and Fontainebleau, the last named one of the most picturesque and extensive of old royal hunting forests, are the most noted. The Thiergarten at Berlin, having an area of 630 acres, and the 2000-acre park at Vienna should be mentioned among the famous European parks.

In the United States public parks on a small scale are as old as the cities. A seaside walk was a common form. The Battery in New York and the Bay Side in Charleston, S. C., are familiar examples. The City Hall Park in New York was originally a playground or common. Boston Common was specifically dedicated to public use by the founders of the city and has more perfectly fulfilled its use than any other equal area in the country. Public squares in nearly all the cities, notably around Yale College in New Haven, have shown the noble expression that may be given to a very limited park by avenues of full-grown native trees. The period of land speculation in the middle of the nineteenth century, when great numbers of cities in the Middle West were founded, was peculiarly unfortunate in the failure to dedicate ground liberally either in park places, public squares, or larger grounds. Many of the so-called "boom" cities which have since been planted farther west have provided for parks and other public grounds in a most liberal manner. In 1851 the city of New York secured special legislation to create Central Park. The property was secured in 1857, and the plans for its development submitted by Frederick Law Olmsted and Calvert Vaux were adopted and put in their charge to be executed. The ground occupied is $2\frac{1}{2}$ miles long north and south and $\frac{1}{2}$ mile east and west. Exclusive of city water works, reservoirs, artificial pleasure lakes, and building sites, the park contains 683 acres. About 110 acres are in lawn, little broken by rocks and only bordered by trees, and the remainder mostly broken ground, in glades and forests, or covered with copses and shrubbery, but nearly all in a condition to have a surface lawn. The grand terrace by Mr. Vaux—the first great work of park architecture executed in the United States—is an admirable study. Prospect Park, in the Borough of Brooklyn, is an outgrowth of the enthusiasm developed

by the creation of Central Park. It contains 550 acres, all of which is available for park use. Fairmount Park in Philadelphia, having an area of 2648 acres, is probably the largest park within the limits of any city. It stretches along the banks of the Schuylkill River. The Wissahickon, flowing through ravines and over numerous waterfalls, imparts a peculiar beauty to the park. Baltimore has a forest park, Druid Hill, of 700 acres, acquired in 1800. Chicago has a magnificent system of parks, of which Jackson Park, comprising a splendidly equipped area of 586 acres, is the foremost. St. Louis with its Forest Park of 1372 acres and Detroit with its Belle Isle of 700 acres furnish examples of liberal provision of park area by American cities. In recent years, under the influence of the fresh-air and recreation movements, there has been a disposition on the part of most city governments not only to acquire additional park areas, but also to make better use, so far as the actual needs of the people are concerned, of the land already possessed. Large tracts are being set off for ball fields, children's playgrounds, and other recreational uses, and the sign Keep off the Grass is no longer ubiquitous.

With the advent of the trolley the outskirts of cities became accessible to the inhabitants, so that parks many miles distant may be reached in a comparatively short time and for a trifling sum. Many of the trolley companies have themselves taken advantage of this fact by fitting up parks on their lines for the sake of the traffic they attract. Descriptions of scores of such parks may be found in the street-railway journals. In Kansas City, e.g., there were five such parks which had in the summer of 1911 an attendance of 1,991,780, spending \$669,605. In a bulletin on "Public Recreation," published by the University of Wisconsin in 1915, the good and evil influences of these commercial amusement parks are described in detail. The enormous popularity of such parks justifies their careful study and their strict oversight as well. Such parks are often outside city limits and so beyond city control. See PLAYGROUNDS AND RECREATION CENTRES.

The feasibility of extended park areas outside the urban centres has also given rise to a form of coöperation between neighboring municipalities which has great possibilities. The most noted example of such coöperation of adjoining cities for the common good is the formation in 1907 of the Metropolitan Park System for Boston and its vicinity. This system includes over 9000 acres of parks, many miles of parkways extending along 30 miles of river banks and 8 miles of seashore, and also immense ocean-bathing establishments. Another example of such coöperation is the formation, in the same year, of the Essex County Park System of New Jersey, nearly 4000 acres in extent. This includes not only parks in the city of Newark and in the heart of the other municipalities in the system, but also a large area of wild land stretching along the ridge of the Orange Mountain and commanding a magnificent view of New York City and the intervening country—the homes of the greatest number of people gathered together in an equal area in the world. To have set aside in perpetuity as a recreation ground for the people such an area in the heart of what may be eventually the largest and most congested population in the world is an act whose importance can scarcely be overestimated.

Passing on to the consideration of those larger parks which have been set aside by state rather than municipal governments, we find a surprising number of such areas in the United States. Massachusetts has acquired large holdings in three different ways: (1) through direct appropriation of funds and purchase of land by the State; (2) through State-appointed commissions; (3) through boards created to receive and care for gifts of land to the State. New York also has some notable possessions: these include the Adirondack Reserve besides important small tracts at Niagara Falls and in the gorge of the Genesee River, in Watkins Glen, and at Stony Point. Coöperating with New Jersey through the Palisades Interstate Park Commission, it is developing a tract along the west bank of the Hudson River known as the Palisades Park. Wisconsin has a State park board of three members, appointed by the Governor. In 1910 this newly appointed board purchased 3800 acres of land in Deer County, including 8 miles of bay shore. California has invested \$250,000 in a State park near Boulder Creek, containing a wonderful growth of redwood. Minnesota, Michigan, and Kansas have all acquired State parks. See CITY PLANNING; PARK, NATIONAL; PARK, NATIONAL MILITARY.

Consult: A. W. Crawford, *Development of Park Systems in American Cities* (Philadelphia, 1905); John Nolen, *Parks and Recreation Facilities* (ib., 1910); T. H. Mawson, *Civic Art* (New York, 1911); the quarterly magazine, *Landscape Architecture*, and publications of the American Park and Outdoor Association (Philadelphia, 1897-1904).

PARK, MILITARY. Any inclosed space in which are stored either guns, wagons, or supplies. Specifically an artillery park is one consisting of guns and their equipment, and similarly an engineers' park would consist of wagons, pontoons, animals, etc. Wagons or other train vehicles, brought together for purposes of storage, camping, or for defense against attack, are said to be parked.

PARK, NATIONAL. In the western portion of the United States, where there have been public lands belonging to the Federal government, Congress has from time to time created national parks in order to protect the wonders of nature, to serve as places of refuge for the wild life of the forests and mountains, and to prevent the private acquisition of land that is valuable to the public for purposes of health and recreation.

The oldest of these parks is the *Hot Springs Reservation*, in central Arkansas, which was reserved from disposition by the Act of April 20, 1832. The present boundaries were fixed and the area dedicated as a public park by the Act of June 16, 1880. Adjacent to the reservation and extending between portions of it is the city of Hot Springs (q.v.), which is in no way under the control of the Federal government. This reservation, which has an area of only 911 acres, was created because of the great value of the hot waters in the treatment of rheumatism and certain other diseases. There are 46 hot springs on the reservation, the waters of which are piped to 20 bathhouses operated as private enterprises under the supervision of a superintendent appointed by the Secretary of the Interior. The Department of the Interior operates a free bathhouse for the indigent sick, and the War Department maintains a general hospital for officers and men of the army and navy, for officers of

the coast guard and the public-health service, and for honorably discharged soldiers and sailors of the regular and volunteer forces of the army and navy.

Yellowstone National Park (q.v.), established by the Act of March 1, 1872, has an area of 2,142,720 acres. The greater part of the park is in Wyoming, but a narrow strip along the northern boundary is in Montana, and a similar strip along the western boundary is in Montana and Idaho. On the north a branch line of the Northern Pacific Railway extends to the park boundary at Gardiner, Mont.; on the west a branch line of the Oregon Short Line Railroad extends to the park boundary at Yellowstone, Mont.; on the east the park is 63 miles distant from Cody, Wyo., the terminus of a branch line of the Chicago, Burlington, and Quincy Railroad.

Yosemite National Park (q.v.), established as a national park by the Act of Oct. 1, 1890, has an area of 719,022 acres. It is, however, even older than the Yellowstone as a public reservation, as the Yosemite valley and the Mariposa grove of big trees were granted to the State of California for a public park by the Act of June 30, 1864. Yosemite National Park outside of Yosemite valley and the Mariposa grove of big trees was established by the Act of Oct. 1, 1890. The Yosemite valley and the Mariposa grove were ceded to the United States by the Legislature of California by the Act of March 3, 1905. This cession was accepted by Congress on June 11, 1906, and only since that date has the area that now constitutes Yosemite National Park been under the exclusive control of the Federal government. By the Act approved Dec. 19, 1913, the city and county of San Francisco was authorized to use the Hetch Hetchy valley for storing water for a municipal water supply. This park is best reached from El Portal, the terminus of the Yosemite Valley Railroad, whence a 16-mile trip brings the traveler to Yosemite village in Yosemite valley.

Sequoia National Park, in California, established by the acts of Sept. 25 and Oct. 1, 1890, has an area of 161,597 acres. This park may be reached from Visalia, on the Southern Pacific and Atchison, Topeka, and Santa Fe railroads, thence by way of electric railway to Lemon Cove, thence 40 miles by stage to the park. This park was established in order to preserve the fine groves of big trees or sequoia (q.v.) that are found within its borders. There are 12 groves of big trees and about 12,000 trees exceeding 10 feet in diameter. The park also contains scenic areas of great beauty.

General Grant National Park, established by the Act of Oct. 1, 1890, has an area of 2536 acres. This park is near the Sequoia Park, from which it may be reached by trail. It may also be reached from Sanger, on the Southern Pacific Railroad, 46 miles distant, or from Cutler, on the Atchison, Topeka, and Santa Fe Railway, 39 miles distant. The features of this park are similar to those of the Sequoia National Park.

Casa Grande (q.v.) *Ruin*, in Arizona, has an area of 480 acres. It was established by presidential proclamation of June 22, 1892, issued under authority of the Act of March 2, 1889. The reservation is 12 miles from Florence, on the Arizona Eastern Railroad, and the same distance from Casa Grande, on the Southern Pacific Railroad. See CASA GRANDE.

Mount Rainier National Park, in west-central Washington, established by the Act of March

2, 1899, has an area of 207,360 acres. This park is best reached from Ashford, a station on a branch line of the Chicago, Milwaukee, and St. Paul Railway, $6\frac{1}{2}$ miles distant from the southern boundary; it may also be reached by trail from Fairfax, $6\frac{1}{2}$ miles distant, on a branch line of the Northern Pacific Railway, as well as by automobile from Seattle, 60 miles distant, and Tacoma, 50 miles distant. The park includes a single great peak, Mount Rainier (q.v.), and its outlying ridges and intervening valleys. Around this mountain, which rises to an elevation of 14,408 feet, is the largest glacial system in the United States radiating from a single peak. The wonderful fields of wild flowers which extend almost to the edge of the ice fields constitute one of the great attractions of this reservation. Over 350 species of ferns and flowering plants grow on this mountain, including great fields of heather, heliotrope, avalanche lilies, anemones, columbines, and larkspur.

Crater Lake National Park (q.v.), in central Oregon, established by the Act of May 22, 1902, has an area of 159,360 acres. On the west this park is reached from Medford, 85 miles distant, on the main line of the Southern Pacific Railroad; on the east it is reached from Chiloquin, 36 miles distant, on a branch line of the Southern Pacific Railroad.

Platt National Park, in Oklahoma, established by the acts of July 1, 1902, and April 21, 1904, has an area of 848 acres. It was first known as the *Sulphur Springs Reservation*, but the name was changed to Platt National Park by the joint resolution approved July 29, 1906. The park is immediately adjacent to the town of Sulphur, on the Atchison, Topeka, and Santa Fe and St. Louis and San Francisco railroads. Within the park are a number of mineral springs, the waters of which are used locally to a considerable extent.

Wind Cave National Park, in South Dakota, established by the Act of Jan. 9, 1903, has an area of 10,522 acres. It is 10 miles from the town of Hot Springs, S. Dak., on the Chicago, Burlington, and Quincy and the Chicago and Northwestern railroads. The chief attraction is a limestone cave, which is accessible to a depth of 400 feet below the surface. A portion of the park has been inclosed in order to serve as a bison range for a herd of these animals presented by the American Bison Society.

Sullys Hill Park, in North Dakota, has an area of 780 acres. It was established by presidential proclamation of June 2, 1904, issued under authority contained in the Act of April 27, 1904. It may be reached from Devils Lake, Tokio, and Narrows stations, on the Great Northern Railway. The park comprises a wooded tract on the shore of Devils Lake.

Mesa Verde National Park, in southwestern Colorado, established by the Act of June 29, 1906, has an area of 48,996 acres. It is best reached from Mancos on the Denver and Rio Grande Railroad, 25 miles distant. The park was created in order to protect the ruins of the cliff dwellers. (See CLIFF DWELLER.) In it there are over 300 cliff dwellings, but only three—Cliff Palace, Spruce Tree House, and Balcony House—have been repaired. Cliff Palace, the largest ruin, is about 300 feet long and probably supported a population of over 400 persons. See MESA.

Glacier National Park, in northwestern Montana, established by the Act of May 11, 1910,

has an area of 981,681 acres. It is reached from Belton and Glacier Park stations on the main line of the Great Northern Railway, which runs along the southern border of the park. While this park receives its name from the many glaciers that are found on the high summits, it is as much renowned for its beautiful lakes and their surrounding forests and mountains. Along the continental divide of the Rocky Mountains, which runs northwest and southeast through the park, is some of the finest scenery on the American continent.

Rocky Mountain National Park, in central Colorado, established by the Act of Jan. 25, 1915, has an area of approximately 229,000 acres. It may be reached from Lyons, on the Chicago, Burlington, and Quincy Railroad; from Fort Collins, on the Union Pacific Railroad; from Loveland, on the Colorado and Southern Railway; and from Granby, on the Denver and Salt Lake Railroad. This park is only 50 miles northwest of Denver, and by reason of its accessibility it is destined to be one of the most popular of the national reservations. The well-known valley known as Estes Park is just east of this reservation, which includes Longs Peak and part of the main range of the Rocky Mountains. The park includes some of the finest scenic areas in Colorado.

The national parks have been established by act of Congress and placed under the supervision of the Secretary of the Interior, who makes the regulations necessary for their protection. The Secretary is assisted by a general superintendent and landscape engineer, and each park is in charge of a supervisor, who has under his control a number of rangers. Yellowstone Park is policed by troops of cavalry under the command of a line officer of the army, who is in charge of the park and who reports to the Secretary of the Interior on matters of civil administration and to the Secretary of War on matters of military discipline. The appropriations for the construction and sprinkling of roads in the Yellowstone Park and for the construction of roads in Crater Lake Park are made to the War Department, and this work is under the supervision of officers of the Engineer Corps of the army, who report directly to the Secretary of War. In the other parks all the employees are civilians. Until the spring of 1914 the Yosemite, Sequoia, and General Grant parks were policed by troops of cavalry, but the soldiers have been withdrawn from these parks, and all the work is done by rangers.

With the exception of the Hot Springs Reservation the parks are maintained by appropriations made each year by Congress. A separate appropriation is made for each park, the practice in this respect being radically different from that of Canada, which makes a lump appropriation for all the parks and allows the administration to spend the money where it is most needed. In addition to the appropriations the revenues from leases and other privileges are available for expenditure in all the parks with the exception of the Mesa Verde, Crater Lake, and Sullys Hill. The Hot Springs Reservation is maintained entirely from the revenues.

The government does not operate any hotels or transportation lines, all these functions being performed by individuals or corporations having a contract for a term of years or a license from year to year. The rates charged are subject to the approval of the Secretary of the Interior,

and all the concessioners pay for the privilege of operating in the parks.

The United States has been a pioneer in the establishment of national parks, but it has been closely followed by the Dominion of Canada, which is developing a fine system of national reservations. Similar reservations are practically unknown in European countries. As the country becomes more thickly settled, the wisdom of the policy of reserving these tracts of land becomes more and more apparent. What the city parks are to the municipalities the national parks are to the nation. They offer rest, recreation, and inspiration to thousands of people. In all of them the tourist is free to come and go as he will, subject only to the regulations designed to protect the natural curiosities, the forests, and the wild animals. Hunting is forbidden, but fishing is allowed with appropriate limitations on the size of the catch. Some parks have reached a high stage of development, and the tourist may select his means of transportation—he may proceed by coach, on horseback, or on foot; he may stop at hotels or permanent camps or may make his own camp. In portions of the parks the lack of roads and camps will compel the tourist to travel on horseback accompanied by a pack train.

The term "national parks" is generally understood to mean reservations which have been created because of their general interest and value and which are under the supervision of the Secretary of the Interior. Parks created for a special purpose, even if they are owned by the United States, are not regarded as national parks in the general use of this term, e.g., *National Zoological Park*, *Potomac Park*, and *Rock Creek Park* in the District of Columbia. These form part of the park system of the District of Columbia.

The Department of the Interior issues an annual report on each park and annual circulars giving data regarding hotels, camps, and places of interest in the larger and more important parks. The same department issues also a series of publications on the natural features of the parks. In 1914 the Secretary of the Interior appointed a landscape engineer and superintendent of national parks. Consult John Muir, *Our National Parks* (Boston, 1909), and E. F. Allen, *A Guide to the National Parks of America* (New York, 1915).

PARK, NATIONAL MILITARY. National military parks have been established by acts of Congress to preserve some of the famous battlefields of the War of the Rebellion as memorials and for purposes of historical and military study. These parks are under the general supervision of the Secretary of War and are managed by commissions appointed by him. *Chickamauga and Chattanooga National Military Park*, in Tennessee and Georgia, established by the Act of Aug. 19, 1890, has an area of 6966 acres. It includes Missionary Ridge and Look-out Mountain and the ground on which the battles of Chickamauga and Chattanooga were fought on Sept. 19–20 and Nov. 23–25, 1863, respectively. The commission in charge has its office at Chattanooga, Tenn. *Shiloh National Military Park*, in Tennessee, established by the Act of Dec. 27, 1894, has an area of 3546 acres. It includes the ground on which the battle of Shiloh was fought on April 6 and 7, 1862. The commission in charge has its office at Pittsburg Landing, Tenn. *Gettysburg National Military*

Park, in Pennsylvania, established by the Act of Feb. 11, 1895, has an area of 24,460 acres. It includes the ground on which the battle of Gettysburg was fought on July 1, 2, and 3, 1863. The commission in charge has its office at Gettysburg, Pa. *Vicksburg National Military Park*, in Mississippi, established by the Act of Feb. 21, 1899, has an area of 1323 acres. It includes the Confederate earthworks at Vicksburg and the positions occupied by the Union troops during the siege in April and May, 1863. The commission in charge has its office at Vicksburg, Miss. A portion of the battlefield at Antietam, Md., is owned by the United States, but the area does not have the status of a national military park; the tracts owned by the government are under the supervision of the quartermaster general of the army.

Pamphlets on the parks and the battles may be obtained from the various commissions at the addresses given above.

PARK, EDWARDS AMASA (1808–1900). An American theologian. He was born in Providence, R. I., Dec. 29, 1808. He graduated at Brown University in 1826, Andover Seminary in 1831, and was ordained as colleague pastor with Rev. Richard Salter Storrs, of Braintree, Mass., in the latter year. In 1835 he became professor of intellectual philosophy at Amherst College and the following year was called to Andover Theological Seminary as professor of sacred rhetoric. Nine years later he was transferred to the chair of systematic theology, succeeding the first incumbent, Rev. Dr. Leonard Woods. In this position Professor Park remained till he retired from active labor in 1881. He died June 4, 1900. Dr. Park was a famous preacher, but he was before all things else a teacher, and his influence from his lecture room was second to that of no man of his generation. In a sense he was the last of the New England theologians. (See *NEW ENGLAND THEOLOGY*.) His system may be defined in a phrase as that of the Westminster Confession, grounded upon a new philosophy and purged of its artificial and realistic details. His literary labors appeared chiefly in the *Bibliotheca Sacra*, which he continued to edit until 1884. He also published memoirs of Samuel Hopkins (Boston, 1854), Nathaniel Emmons (ib., 1861), and others, and a volume of *Discourses on Some Theological Doctrines as Related to the Religious Character* (Andover, 1885). Consult the memorial address by R. S. Storrs (New York, 1900), the volume in celebration of his ninetieth birthday (Boston, 1898), and *Memorial Collection of Sermons* (ib., 1902).

PARK, MUNGO (1771–1806). An eminent African explorer. He was born near Selkirk, in Scotland, was educated in Edinburgh University, and devoted his attention particularly to the study of surgery. In 1792 he went to the East Indies as a surgeon in the sea service of the East India Company. Returning from his first voyage, he offered his services as successor to Major Daniel Houghton, who had lost his life while searching for the Niger, to the African Association, which for half a century was the chief promoter of the exploration of Africa. Under its auspices, in 1795, at the age of 24, he went to the Gambia River with instructions to reach the Niger River and to ascertain its source, its course, and, if possible, its termination. After acquiring some knowledge of the Mandingo language he set out for the interior

in December, 1795, crossed the Senegal, and finally reached the Niger at Sego in July, 1796. He went down the river until he was within 15 days' travel of Timbuktu, which he could not reach on account of the tropical rains and because he had entered the country of merciless and fanatical Mohammedans. After having been in the interior for 19 months he returned home and wrote *Travels in the Interior of Africa* (1799; frequently reprinted).

The achievements of this solitary white man in inner Africa excited the widest interest. He had brought to light more important facts respecting the geography of western Africa than had any former traveler. By pointing out the positions of the sources of the Senegal and Gambia he showed where to look for the elevated parts of the country and for the water partings between the Gambia and Niger and between the fertile country and the desert. The success of his first journey induced the British government to employ him to complete the discovery of the course of the Niger. He received a captain's commission and was accompanied by his brother-in-law, Anderson, and 45 English soldiers, besides natives. He started into the interior in April, 1805. Of the white soldiers only three were of value to the expedition. Many died, and when the party embarked in canoes on the Niger to float down to its mouth, it had dwindled to seven men. Anderson died in October. Undaunted by his misfortunes, Park was resolved to find the mouth of the Niger. He sailed more than 1000 miles, but, entering a stretch of rapids below Yuri on the lower river, while both shores were lined with hostile natives, the boat was wrecked, and Park and his three surviving comrades were drowned. The journal he sent home and information obtained by later explorers give all the facts known about his last expedition. An "Account of the Life of Mungo Park," by Wishaw, was published in Park's *Journal of a Mission to the Interior of Africa* (1815).

PARK, ROSWELL (1852-1914). An American physician, born at Pomfret, Conn. He studied at Racine College and at Harvard University and in 1876 graduated in medicine at Northwestern University. During the following years he was interne at several hospitals and a member of the faculties of the Woman's Medical College (Chicago), Northwestern University, and Rush Medical College. In 1883 he was elected professor of surgery at the University of Buffalo, and afterward became surgeon to the Buffalo General Hospital and director of the State Pathological Laboratory at Buffalo. Park attended President McKinley after he had been shot in September, 1901, at the Pan-American Exposition. He served as president of the Medical Society of the State of New York and of the American Surgical Association (1900). His writings include: *Lectures on Surgical Pathology* (1891); *Text Book of Surgery* (1896); *History of Medicine* (1897); *Principles and Practice of Modern Surgery* (1907); *Selected Papers, Surgical and Scientific* (1914).

PARK CITY. A town in Knox Co., Tenn., near Knoxville, of which it is a residential suburb. Pop., 1910, 5126.

PARK CITY. A city in Summit Co., Utah, 35 miles by rail east-southeast of Salt Lake City, on the Union Pacific and the Denver and Rio Grande railroads (Map: Utah, C 2). It is in a rich silver and lead mining district, and

its chief mechanical industries are metallurgical. The water works are owned by the city. Park City was founded in 1874 and in 1898 was almost completely destroyed by fire. Pop., 1900, 3759; 1910, 3439.

PARK COLLEGE. A coeducational institution for higher education founded in 1875 at Parkville, Mo., through the efforts of Col. George F. Park and Rev. John A. McAfee. The buildings include Woodward Hall, a dormitory for boys, McCormick Chapel, the Mackay Building, the Charles Smith Scott Astronomical Observatory, Labor Hall, the Alumni Building, Waverly Hospital, and a number of dormitories and colleges. Most of the buildings on the campus were erected by student labor. The primary educational feature of the college is Christian training. It provides exceptional opportunities for young men without financial resources to secure for themselves a liberal education. A special student-help department is maintained, through which students may secure employment throughout the course. In addition to the college there is an academy which is under the same general management. The total enrollment in all departments of the college in 1914-15 was 420, and the faculty numbered 20. The endowment in 1914 amounted to \$489,320 and the value of the grounds, buildings, and equipment to \$394,684, the yearly income being about \$80,000. The library contains about 30,000 volumes. The president in 1915 was Arthur L. Wolfe.

PARKE, JOHN GRUBB (1827-1900). An American soldier, born in Chester Co., Pa. He graduated at West Point in 1849 and was assigned to the topographical engineers. From 1857 until the outbreak of the Civil War he was engaged in surveying the northwest boundary between the United States and what is now Canada. In 1861 he was commissioned brigadier general of volunteers and in 1862 was placed in command of one of the three brigades in Burnside's North Carolina expedition, during which he assisted at the capture of Roanoke Island (Feb. 8, 1862) and Newbern (March 14, 1862) and commanded at the capture of Fort Macon (April 26, 1862). For these services he was promoted major general of volunteers the same year and was made chief of staff of the Ninth Corps, with which he served at South Mountain (Sept. 14, 1862) and Antietam (Sept. 16-17, 1862). When his superior, General Burnside, was appointed commander of the Army of the Potomac, Parke remained his chief of staff until after the battle of Fredericksburg (Dec. 13, 1862). He accompanied the Ninth Corps into Kentucky the following March and commanded it before Vicksburg. At Jackson, Miss. (July 16, 1863), he commanded Sherman's left wing; his corps was ordered north, and he took part in the siege of Knoxville (Nov. 15-Dec. 5, 1863) and the pursuit of Longstreet into Virginia. He participated in the battles of the Wilderness and Spotsylvania. During the latter part of the Richmond campaign he again commanded the Ninth Corps, which he led at the capture of Petersburg and in the pursuit to Appomattox. He was mustered out of the volunteer service on Jan. 15, 1866, and returned to the northwest boundary survey. Subsequently he had charge of various military works and was superintendent of West Point from 1887 to 1889, when he retired from active service with the rank of colonel of engineers and the brevet of major

general in the regular army. He published *Compilations of Laws of the United States Relating to Public Works for the Improvement of Rivers and Harbors* (1877; rev. ed., 1887) and *Laws Relating to the Construction of Bridges over Navigable Waters* (1882; rev. ed., 1887).

PARKER, ALTON BROOKS (1852-). An American jurist and Democratic leader. He was born at Cortland, N. Y. It was his early intention to fit himself for a teacher, and under heavy difficulties he worked his way through the Cortland Normal School. Teaching, however, proved distasteful to him, and he entered the law office of Schoonmaker and Hardenburgh at Kingston, N. Y., and completed the course at the Albany Law School in 1873. In 1877 Parker was elected surrogate of Ulster County, and he held that position until 1885. He was a delegate to the Democratic National Convention in 1884 and in 1885 successfully managed the Democratic gubernatorial campaign. In 1886 he was appointed by Governor Hill to a vacancy in the Supreme Court and in the autumn of the same year was elected as the candidate of both parties for a full term. He was transferred to the Appellate Division of the Supreme Court in 1889 and was Chief Justice of the New York Court of Appeals in 1898-1904, when he resigned to accept the Democratic nomination for the presidency. When notified of his nomination he sent his famous "gold telegram" to the Democratic Convention, declaring for the gold standard. In the ensuing campaign he engaged in a controversy with Theodore Roosevelt over campaign contributions to the Republican party. After his defeat by Roosevelt he resumed the practice of law in New York City. He was temporary chairman of the Democratic National Convention in 1912 and was chief counsel for the managers in the impeachment trial of Gov. William Sulzer (q.v.) in 1913. In 1906-07 Parker was president of the American Bar Association and in 1914 presided over the New York State Bar Association.

PARKER, ARTHUR CASWELL (1881-). An American archaeologist, born at Iroquois, N. Y., and educated at Williamsport Dickinson Seminary (1898-1901), later making special studies in anthropology under Prof. F. W. Putnam (1901-03). He served as special assistant archaeologist at the American Museum of Natural History (1901-02), field archaeologist of the Peabody Museum (1903), and ethnologist of the New York State Department of Education (1904-06). In the latter year he became archaeologist of the New York State Museum. Parker published *Excavations in an Erie Indian Village* (1907) and *Iroquois Uses of Maize and Other Food Plants* (1910).

PARKER, EDWARD HARPER (1849-). An English Chinese scholar. From 1869 to 1871 he traveled in Mongolia. Thereafter until 1895 he was connected with the British consular service in the Far East, especially in China and Korea. In 1896 he was appointed reader in Chinese at University College, Liverpool, and in 1901 professor of Chinese at Victoria University, Manchester. His works include: *Comparative Chinese Family Law* (1879); *The Opium War* (1887); *Burma* (1893); *A Thousand Years of the Tartars* (1895); *John Chinaman* (1901); *China* (1901); *China Past and Present* (1903); *China and Religion* (1905); *Ancient China Simplified* (1908); *Studies in Chinese Religion* (1910).

PARKER, EDWIN WALLACE (1833-1901). An American Methodist Episcopal missionary bishop, born at St. Johnsbury, Vt. He was educated at the St. Johnsbury Academy and at the General Biblical Institute at Concord, N. H., joining the Vermont Conference of his denomination in 1857. In 1859 he sailed for India and spent the rest of his life there, becoming one of the great leaders in his field. He was several times presiding elder and was for several years superintendent of the Moradabad mission schools. In 1900 he was elected Missionary Bishop of Southern Asia. Consult J. H. Messmore, *The Life of Edwin Wallace Parker* (New York, 1903).

PARKER, FOXHALL ALEXANDER (1821-79). An American naval officer, born in New York City. He graduated at the Naval School in Philadelphia in 1843, served against the Florida Indians, and in 1850 became a lieutenant. In the Civil War he first commanded the gunboats *Mahaska* and *Wabash* and after 1863 the Potomac flotilla. In 1866 he was promoted captain and in 1872 commander. In 1873 he was chief signal officer of the navy and from 1878 until his death was superintendent of the Naval Academy at Annapolis. He published: *Fleet Tactics under Steam* (1863); *Squadron Tactics under Steam* (1863); *The Naval Howitzer Afloat* (1865); *The Naval Howitzer Ashore* (1865); *The Fleets of the World: The Galley Period* (1876); *The Battle of Mobile Bay* (1878).

PARKER, FRANCIS WAYLAND (1837-1902). An American educator, born at Bedford, N. H. He served throughout the Civil War, rising from private to colonel of the Fourth New Hampshire Volunteers. He was principal of a school in Manchester, N. H. (1865-68), and of one at Dayton, Ohio, from 1868 until 1872, when he went to Berlin to study psychology, philosophy, and pedagogy. Afterward he was school superintendent in Quincy, Mass. (1875-80), supervisor in Boston (1880-83), principal of Cook Co., Ill., Normal School (1883-96), and of the Chicago Normal School (1896-99). He was appointed president of the Chicago Institute in 1899. His publications include: *Talks on Teaching* (1883; 15th ed., 1903); *Practical Teacher* (1884); *Course in Arithmetic* (1884); *How to Study Geography* (1889; 3d ed., 1892).

PARKER, GEORGE HOWARD (1864-). An American zoölogist, born in Philadelphia. He graduated at Harvard University (S.B., 1887; S.D., 1891), and from 1891 to 1893 studied at Leipzig, Berlin, and Freiburg. While at Harvard he had taught zoölogy, and after his residence abroad he returned to his alma mater, becoming professor in 1906. A member of the National Academy of Sciences, in 1914 Parker was appointed by the President of the United States as a representative of the Academy on a special commission to examine and report on the condition of the fur seals in Alaska. He contributed frequently to zoölogical journals, mainly on the anatomy and physiology of sense organs and on animal reactions, and also published *Biology and Social Problems*, William Brewster Clark Lectures (1914).

PARKER, SIR (HORATIO) GILBERT (1862-). A British novelist and legislator. He was born in Camden East, Ontario, Canada, and was educated privately and at Trinity College, Toronto. He studied for admission to the ministry of the Church of England in Canada, of which he was ordained deacon in 1882, but in

1884 he began a journalistic and literary career. In 1885 he went to Australia, became associate editor of the *Sydney Herald*, and also wrote and adapted plays. After traveling extensively in Australasia he returned to Canada, but in 1897 settled in London, England. He first became widely known for his short stories and romances of Canadian life and character, exploiting a literary vein successfully attempted by William Kirby (q.v.), but after 1900 he devoted himself also to other themes, largely those concerned with British Imperial prospects and interests. In 1900 Parker was elected Conservative member for Gravesend in the Imperial House of Commons. The first Imperial Universities Conference in London in 1903 was due chiefly to his initiative. After the outbreak of the War in Europe in 1914, he wrote in behalf of the British cause. He was knighted in 1902 and in 1915 was made Baronet. His plays include: *The Vendetta* (1889); *No Defence* (1889); *The Seats of the Mighty* (1897). Besides these, a book of travels, *Round the Compass in Australia* (1892), and a volume of poems, *A Lover's Diary* (1894), he wrote: *Pierre and his People* (1892); *Mrs. Falchion* (1893); *The Trespasser* (1893); *The Translation of a Savage* (1894); *The Trail of the Sword* (1894); *When Valmond Came to Pontiac* (1895); *An Adventurer of the North* (1895); *The Seats of the Mighty* (1896); *The Pomp of the Lavilletes* (1897); *The Battle of the Strong* (1898); *The Lane that Had no Turning* (1900); *The Right of Way* (1901); *Donovan Pasha* (1902); *History of Old Quebec* (1903); *A Ladder of Swords* (1904); *The Weavers* (1907); *Northern Lights* (1909); *Cumner's Son* (1910); *The Land, the People, and the State* (1910); *The Judgment House* (1913); *You never Know your Luck* (1914); *The World in the Crucible* (1915), a book on the Great War.

PARKER, HERSCHEL CLIFFORD (1867-). An American physicist and mountain climber, born in Brooklyn, N. Y. He graduated in 1890 from the School of Mines of Columbia University, where he taught physics until 1911, having become professor in 1903. Between 1897 and 1903 he made explorations in the Canadian Alps and several first ascents, including Mounts Goodsir and Dawson (British Columbia) and Mounts Hungabee, Deltaform, Biddle, and Lefroy (Alberta). In 1906, 1910, and 1912 he explored the Mount McKinley region of Alaska, leading a successful expedition from the Alaskan coast to the summit, and in 1907 climbed Mount Olympus, Washington. On his first partial ascent of Mount McKinley he was accompanied by Frederick A. Cook (q.v.), whose contention that he had attained the summit of that mountain Parker was instrumental in refuting in 1909 and 1910, when suspicions were aroused concerning the validity of Cook's claim to have discovered the North Pole. Parker became a member of numerous scientific and alpine societies. He made his home in Brooklyn. Besides various articles on mountaineering and on incandescent electric lighting (a field in which he did research work in 1903-07), he is author of *A Systematic Treatise on Electrical Measurements* (1897).

PARKER, HORATIO WILLIAM (1863-). An American composer and teacher. He was born at Auburndale, Mass., and was a pupil first of his mother, then of George W. Chadwick and Stephen A. Emery, and subsequently of the

Munich Conservatory, where he graduated in 1885. After returning to America he became organist of the Garden City Cathedral, Long Island, and professor of music at the Cathedral School. In 1886 he was organist and choir-master at St. Andrew's, New York, and two years later went to Trinity Church, Boston. He became professor of music at Yale University in 1894, in the same year founding the New Haven Symphony Orchestra. Parker was chosen a member of the American Academy of Arts and Letters. His oratorio, *Hora Novissima* (1893), has been called by European critics one of the finest of American compositions, and, as in the case of Elgar (q.v.), none of his subsequent works measure up to the composition that made him famous. In 1911, with Brian Hooker (q.v.), who wrote the libretto, he won a \$10,000 prize in a contest instituted by the Metropolitan Opera House, the successful opera *Mona* being produced the following year. Once more, with Hooker, he carried off a \$10,000 prize with the opera *Fairyland*, produced in 1915 in Los Angeles as part of a municipal anniversary celebration. For the centennial celebration of the foundation of the Handel and Haydn Society of Boston Parker wrote his third oratorio, *Morven and the Grail* (1915). His other works include a symphony in C; a concert overture in E flat, and two overtures, *Regulus* and *Count Robert of Paris*; a concerto for organ, harp, and orchestra; the oratorio *St. Christopher* (1896); the choral works with orchestra: *The Ballad of the Knight and his Daughter* (1884), *King Trojan* (1885), *Der Normannenzug* (1889), *The Holy Child* (1890), *The Kobolds* and *Harold Harfagar* (1891), *The Dream King* (1893), *A Wanderer's Psalm* (1900), *A Star Song* (1901); *The Leap of Roushan Bey* (1914); pieces for piano and organ; songs; chamber music.

PARKER, SIR HYDE (1739-1807). A British admiral, son of a vice admiral under whom he first served. He was knighted in 1779 for his success three years before in occupying the North River (the Hudson being so named for a short distance from its mouth), which was strongly fortified by the Revolutionary forces. He served through the Revolutionary War, was appointed commander in chief at Jamaica in 1796, and in January, 1801, was sent into the Baltic to terrorize Denmark. His second in command, Lord Nelson, urged bolder action than seemed good to Parker, and in the battle off Copenhagen took command in the lighter vessels because of the shallow channel and refused to obey the order to retreat issued by Parker, who was loath to infringe the customary rules of naval warfare. Parker was soon replaced by Nelson and saw no further service.

PARKER, JOEL (1795-1875). An American jurist, born at Jaffrey, N. H. He graduated at Dartmouth College in 1811 and, after studying law, practiced at Keene. He was appointed an associate justice of the Supreme Court of New Hampshire in 1833 and was chief justice in 1838-48. In 1840 he was chairman of the committee on the revision of the State statutes, professor of medical jurisprudence at Dartmouth in 1847-57, and in 1847-75 professor of law at Harvard. Conservative in politics, he opposed during the Civil War the exercise by the President of what he deemed unconstitutional powers. His publications include: *Non-Extension of Slavery* (1856); *Personal Liberty Laws* (1861);

The Right of Secession (1861); *Constitutional Law* (1862); *The War Powers of Congress and of the President* (1863); *Revolution and Reconstruction* (1866); *Conflict of Decisions* (1875).

PARKER, JOEL (1799-1873). An American Presbyterian minister and educator, born at Bethel, Vt. After graduating from Hamilton College in 1824, he studied at Auburn Theological Seminary and in 1827 was ordained to the ministry. He was pastor at Rochester, N. Y. (1826-30), organized and was pastor (1830-33) of the Dey Street Presbyterian Church, New York City, and held charges in New Orleans (1833-38) and New York (Broadway Tabernacle, 1838-40). From 1840 to 1842 Dr. Parker was the second president of Union Theological Seminary and its first professor of sacred rhetoric. Subsequently he occupied pulpits in Philadelphia (1842-52), New York City (1852-62), and Newark, N. J. (1862-68). His writings include: *Lectures on Unitarianism* (1829); *Morals for a Young Student* (1832); *Invitation to True Happiness* (1843); *Reasonings of a Pastor* (1849); *Sermons* (1852); *Pastor's Initiatory Catechism* (1855).

PARKER, JOEL (1816-88). An American statesman, born near Freehold, N. J. He graduated at Princeton in 1839 and in 1842 was admitted to the bar. In 1847 he was elected to the New Jersey Legislature and in 1852-57 was prosecuting attorney. At the outbreak of the Civil War he was appointed a major general of militia and devoted himself to the work of enlisting volunteers. The next year (1862) he was elected Governor by an unprecedented majority, for, though a Democrat and opposed to the Abolitionists, he was a strong Union man. So energetic and successful was he in raising troops that the draft was never applied in New Jersey, and during Lee's invasion of Pennsylvania in 1863 he induced several recently returned regiments to go again to the front, thereby earning the thanks of that State. Equally successful was his financial policy, for during his administration the State bonds never sold below par, and the adoption of his plan for wiping out the war debt resulted in its being paid off without special taxation. Parker, though a firm supporter of the North, urged a grant of amnesty to all who had been in arms against the Federal government. At the end of his term as Governor, in 1866, he retired to private life, but in 1871 was reelected. In 1875 he was appointed Attorney-General and in 1880-88 was an associate justice of the New Jersey Supreme Court.

PARKER, JOSEPH (1830-1902). An English Congregational clergyman. He was born at Hexham, Northumberland. He had little training in the schools, but read much. In 1852 he attended classes at University College, London. In 1853 he became pastor of the Congregational Chapel at Banbury and remained five years, when he was called to the Cavendish Street Chapel, Manchester. He at first declined on account of a debt contracted in building a new church at Banbury; but the Manchester people assumed the debt, and the transfer was effected. In 1869 he left Manchester and went to London to preach at the Old Poultry Chapel, Cheapside. Here his success was so great that the chapel became inadequate for the congregations, and in 1874 the City Temple on Holborn Viaduct was opened. He continued pastor of the church until his death at his home in Hampstead. His

eccentricities did not always secure public approbation, but he was surrounded by enthusiastic admirers who turned the edge of public criticism. He was twice chairman of the London Congregational Board and twice of the Congregational Union of London and Wales. In 1887 he visited America and delivered a eulogy on his friend Henry Ward Beecher. His published works include: *Ecce Deus: Essays on the Life and Doctrine of Jesus Christ* (1868), a reply to *Ecce Homo; The Paraclete* (1874); *The People's Bible* (25 vols., 1885 et seq.); *People's Prayer Book* (1898); *Paterson's Parish* (1898). Works of an autobiographical nature are: *Springdale Abbey: Extracts from the Letters and Diaries of an English Preacher* (1869); *Tyne Chylde: My Life and Ministry, partly in the Daylight of Fact, partly in the Limelight of Fancy* (1883); *A Preacher's Life: An Autobiography and an Album* (1899). Consult William Adamson, *Life of Joseph Parker* (New York, 1903).

PARKER, LAWTON S. (1868-). An American portrait painter. He was born at Fairfield, Mich., studied at the Art Institute, Chicago, in New York under Chase, and, after winning the Chanler scholarship in 1896, in Paris under Gérôme, Laurens, Constant, Benaud, and Whistler. Parker divided his time between America and France. In 1898-99 he was president of the New York School of Art, in 1900 director of the Parker Academy in Paris, and in 1903 president of the Chicago Academy. An able technician, his portraits are strong and well characterized. Among his sitters were Martin A. Ryerson, J. Ogden Armour, Harry P. Judson, N. W. Harris, Judge Grosscup, and Judge J. G. Jenkins. He also painted nudes and plain-air studies. He was the first American to receive a gold medal at the Paris Salon (1913); he also received a gold medal in Munich (1905), the Cohn prize at Chicago (1908), and a medal of honor at the Panama-Pacific Exposition (1915).

PARKER, LINUS (1829-85). An American bishop of the Methodist Episcopal Church South. He was born near Vienna, Oneida Co., N. Y. When 16 years old, he left home to make his fortune and went to New Orleans. At Mandeville College near this city he was for a time a student. Parker served in the Mexican War, then studied law, but finally entered the ministry in 1849. Editor of the *New Orleans Christian Advocate* from 1870 to 1882, in the latter year he was elected Bishop. He was a member of the General Conferences of 1874, 1878, and 1882. Consult C. B. Galloway, *Linus Parker: His Life and Writings* (Nashville, 1886).

PARKER, LOUIS NAPOLEON (1852-). An English dramatist, also a composer. He was born at Calvados, France, and was educated at Freiburg im Breisgau and at the Royal Academy of Music, London, of which he became a fellow in 1898. From 1877 to 1896 he was director of music in Sherborne School. He was responsible as author, collaborator, or translator for many successful plays. These include: *A Buried Talent* (1890); *Rosemary* (1896); *The Ter-magant* (1898); *Cyrano de Bergerac* (1900); *Beauty and the Barge* (1904); *The Duel* (1907); *Beethoven* (1909); *Pomander Walk* (1910); *Chantecler* (1911), from the French of Ros-tand; *Sire* (1911); *Disraeli* (1911); *The Lady of Coventry* (1911); *Drake* (1912); *The Paper Chase* (1912); *Joseph and his Brethren* (1913);

The Highway of Life (1914), played in London as *David Copperfield*. Parker's work is of especially high quality in *Pomander Walk*, one of the most delightful of comedies; in *Disraeli*, which, as played by George Arliss, was a great success; in *Drake*; and in *Joseph and his Brethren*, of spectacular type but powerfully dramatic.

PARKER, MATTHEW (1504-75). Archbishop of Canterbury. He was born at Norwich, Aug. 6, 1504, studied at Corpus Christi College, Cambridge, and was ordained a priest in 1527. At the university he was a distinguished student and was from an early period favorably disposed towards the doctrines of the Reformation and lived in close intimacy with some of the more ardent reformers. In 1535 he was appointed chaplain to Queen Anne Boleyn. With this appointment he obtained the deanery of the monastic college of Stoke-by-Clare in Suffolk. Here he appears to have first definitely sided with the reforming party in the church and state, the sermons which he preached containing bold attacks on different Catholic tenets and practices. In 1538 Parker took the degree of D.D., and in 1544, after some minor changes, became master of Corpus Christi College, Cambridge, which he ruled admirably. Three years later he married and probably about this time drew up his defense of the marriage of priests, entitled *De Conjugio Sacerdotum*. In 1552 he was presented by King Edward VI to the rich deanery of Lincoln. On the accession of Queen Mary he refused to conform to the reestablished order of things and was deprived of his preferments and even obliged to conceal himself. It does not appear, however, that he was eagerly sought after by the emissaries of Mary, for he was very unwilling to disturb the framework of the church. On the death of Mary and the accession of Elizabeth (1558) he was appointed by the Queen Archbishop of Canterbury. The consecration took place in Lambeth Chapel, Dec. 17, 1559.

The subsequent history of Archbishop Parker is that of the Church of England. The difficulties that beset him were very great. Elizabeth herself was addicted to various "popish" practices, such as the use of images, and was strongly in favor of the celibacy of the clergy. Parker's greatest anxiety was in regard to the spirit of sectarian dissension within the bosom of the church itself. Already the germs of Puritanism were beginning to spring up, and there can be no doubt that their growth was fostered by the despotic caprices of the Queen. Parker himself was manifestly convinced that, if ever the Reformation was to be firmly established in the land at all, some definite ecclesiastical forms and methods must be sanctioned to secure the triumph of order over anarchy, and he vigorously set about the repression of what he thought a mutinous individualism incompatible with a catholic spirit. That he always acted wisely or well cannot be affirmed; he was forced into intolerant and inquisitorial courses, and as he grew older he grew harsher, the conservative spirit increasing with his years. Though favoring the Reformation, he was moderate and cared more to keep the church united than to lead it on to further advances. He gave the English people the "Bishops' Bible," which was undertaken at his request, prepared under his supervision, and published at his expense in 1572. Much of his time and labor

from 1563 to 1568 was given to this work. He had also the principal share in drawing up the *Book of Common Prayer*, for which his skill in ancient liturgies peculiarly fitted him, and it was under his presidency that the *Thirty-nine Articles* were finally reviewed and subscribed by the clergy (1562). Parker died in the palace at Lambeth, London, May 17, 1575.

Among other works, Parker published in 1567 an old *Saxon Homily on the Sacrament*, by Ælfric of St. Albans, *A Testimonie of Antiquitie Showing the Auncient Fayth in the Church of England Touching the Sacrament of the Body and Bloude of the Lord*, to prove that transubstantiation was not the doctrine of the ancient English church; edited (1571) the histories of Matthew of Westminster and Matthew Paris; and superintended the publication of a most valuable work, *De Antiquitate Britannicæ Ecclesiæ*, probably printed at Lambeth in 1572, where the Archbishop, we are told, had an establishment of printers, engravers, and illuminators. He also founded the Society of Antiquaries and was its first president; endowed the University of Cambridge and particularly his own college with many fellowships and scholarships and with a magnificent collection of manuscripts relating to the civil and ecclesiastical condition of England and belonging to nine different centuries (from the eighth to the sixteenth). His correspondence from 1535 on was published by the Parker Society (Cambridge, 1853). Consult his *Life* by Strype (best ed., 3 vols., Oxford, 1821), and in Hook's *Archbishops of Canterbury*, vol. iv (N. S., London, 1872); also W. M. Kennedy, *Archbishop Parker* (ib., 1908). In his honor the Parker Society was formed, which published 56 volumes of Elizabethan ecclesiastical literature (Cambridge, 1841-54).

PARKER, SIR PETER (1721-1811). A British naval officer, born probably in Ireland. He entered the navy and became lieutenant in 1743 and captain in 1747. He served in the West Indies and took part in the capture of Belle-Isle in 1761. For 10 years he was out of the service on account of the reduction of the navy. He was knighted in 1772, rejoined the service in 1773, and in October, 1775, with a small squadron, was sent to cooperate with Sir Henry Clinton in the reduction of the Southern Colonies of America. The attempt of Josiah Martin (q.v.) to arouse the Tories of North Carolina failed, and Parker proceeded to Charleston and made the unsuccessful attack on Fort Moultrie, June 28, 1776. He aided Lord Howe in the capture of New York in September and commanded the squadron which afterward took possession of Rhode Island. In April, 1777, he was promoted to rear admiral and placed in charge of Jamaica in 1778. He became vice admiral in 1779, was made Baronet when he returned to England in 1782, and became admiral in 1787. From 1793 to 1799 he was commander in chief at Portsmouth and succeeded Lord Howe as admiral of the fleet. He is perhaps best remembered as the friend and patron of Nelson.

PARKER, PETER (1804-88). An American medical missionary and diplomat. He was born in Framingham, Mass., graduated at Yale College in 1831, studied theology and medicine at New Haven, and after receiving his M.D. and being ordained to the Congregational ministry went to China as a missionary in 1834. He estab-

lished a hospital at Canton, principally for eye diseases, but soon widened in scope. Dr. Parker possessed great surgical skill, and his fame spread rapidly. War breaking out in 1840 between England and China, the hospital was closed, and Dr. Parker returned to the United States. In 1842 he went back to China and reopened the hospital. In 1845 he resigned his connection with the American Board of Commissioners for Foreign Missions, and became secretary to the United States Legation and interpreter of the new embassy, still having charge of the hospital. In the absence of the Minister he acted as *chargé d'affaires*. In 1855, his health having failed, he again visited the United States, but by request of the government he returned the same year to China as commissioner with full power to revise the Treaty of 1844. This position he held until a change of administration in 1857, when, his health again failing, he returned to the United States and settled in Washington. He became a regent of the Smithsonian Institution in 1868. Parker published: *Reports of the Ophthalmic Hospital at Canton (1836-52)*; *Statements Respecting Hospitals in China (1841)*; *Notes of Surgical Practice amongst the Chinese (1846)*.

PARKER, QUANA. See QUANA PARKER.

PARKER, THEODORE (1810-60). An American preacher, scholar, and reformer. He was born in Lexington, Mass., Aug. 24, 1810. His father was farmer and mechanic, and the son shared actively in his occupations in the intervals of study at the district school and Lexington Academy. He entered Harvard College in 1830 and took the full course of study privately, passing all the examinations, but getting no A.B. degree because he had paid no tuition fees. In 1840 the degree of A.M. was given him. By that time he had mastered several languages which the college did not teach. In 1833 he entered the Harvard Divinity School, from which he graduated in 1836. He was ordained June 21, 1837, and the same day installed pastor of the West Roxbury Unitarian Church. May 19, 1841, he preached in South Boston an ordination sermon, "The Transient and Permanent in Christianity," which attracted much attention and elicited violent opposition. With Channing's "Baltimore Sermon" of 1819 and Emerson's Divinity School Address of 1838, it is accounted one of the three epoch-making sermons of the Unitarian development. It was virtually a rejoinder to Andrews Norton's "Latest Form of Infidelity," which, replying to Emerson's address, contended that no man can be a Christian who accepts the teachings of Jesus for any other reason than that of their miraculous attestation. The sermon did not deny the miraculous in Christianity, but men's present need of it. Invited to preach in Boston, his first important sermons were gathered into a book, *A Discourse on Matters Pertaining to Religion (1842)*, which increased the controversial heat. There were Unitarians who wished formally to expel him from their fellowship and did achieve his virtual exclusion when most of the ministers refused to fellowship with him in church relations. In 1846 the Twenty-eighth Congregational Society was formed in Boston, and he became its minister, preaching in the Melodeon until 1852, and for the next seven years to a congregation of several thousands in Music Hall. To much controversial preaching he added more of the kind represented by his

Lessons from the World of Matter and the World of Man (1865). He had inherited a tendency to consumption and in January, 1859, was attacked with severe illness. He was taken to Santa Cruz and there wrote his *Experience as a Minister (1859)*. From Santa Cruz he went to England and thence to Italy and died, May 10, 1860, at Florence, where he is buried in the Protestant Cemetery. Theodore Parker's Christianity was antisupeatural; his philosophy intuitional, transcendental; his theology theistic, affirming God, the moral law, and immortality as certainties of consciousness. His conception of Jesus was purely humanitarian, and his criticism of the Bible anticipated the results of more recent orthodox scholarship. He was one of the most conspicuous leaders of the New England Abolitionists, uniting a great personal admiration for Garrison with some differences from his views and aims.

Bibliography. His works have been published collectively (edited by Frances Power Cobbe, 14 vols., London, 1863-70; 10 vols., Boston, 1870; and, with additions, in the centenary edition, 15 vols., Boston, 1907). Consult also his *Historic Americans (Boston, 1870)*; *Discourse on Matters Pertaining to Religion*, with introduction by Hannah E. Stevenson (New York, 1871); *Prayers*, with memoir by F. B. Sanborn (Boston, 1882); *Views of Religion*, with introduction by James Freeman Clark (ib., 1885); *West Roxbury Sermons (ib., 1892)*; *Transient and Permanent in Religion (ib., 1908)*; *Rights of Man in America*, edited by F. B. Sanborn (Boston, 1911). Also his *Autobiography* (centenary edition, Boston, 1910); and John Weiss, *Life and Correspondence of Theodore Parker (New York, 1864)*; J. W. Chadwick, *Theodore Parker (Boston, 1908)*; F. B. Sanborn, "Theodore Parker and Emerson," in *Recollections of Seventy Years*, vol. ii (ib., 1909).

PARKER, THOMAS JEFFERY (1850-98). A British zoologist, born in London, a son of William Kitchen Parker (q.v.). He received his education in the Royal School of Mines and in the University of London. From 1872 to 1880 he was demonstrator under Huxley at South Kensington and lecturer in biology in Bedford College, London. In 1880 he became professor of biology in the University of Otago, Dunedin, New Zealand. He published a number of memoirs on New Zealand animals, important of which are: *On the Structure and Development of Apteryx* and *On the Cranial Osteology, Classification, and Phylogeny of the Dinornithidae*. He also wrote the following textbooks, in which great literary and artistic ability are joined with extensive knowledge and pedagogical skill: *Zootomy (1884)*; *Lessons in Elementary Biology (1890)*; *A Text-Book of Zoology (1897)*, with W. A. Haswell. The last named is the guide followed in the classification of animals in this ENCYCLOPÆDIA. Professor Parker died at Warrington, New Zealand, Nov. 7, 1898.

PARKER, WILLARD (1800-84). An American surgeon, born at Hillsborough, N. H. He graduated from Harvard in 1826 and from its Medical School in 1830, when he was made professor of anatomy in Vermont Medical College and in the same year professor of anatomy in the Berkshire Medical College, in which latter institution he became professor of surgery in 1833, holding the post till 1836, when he removed to Cincinnati. In 1837 he spent several months in the hospitals of London and Paris.

Upon his return he settled in New York City, where he was appointed professor of surgery at the College of Physicians and Surgeons; this post he occupied for 30 years. He then became professor of clinical surgery. In 1854 he first described and reported cases of what is now known as malignant pustule. In 1865 he was made president of the New York State Inebriate Asylum at Binghamton and in 1867 a member of the Metropolitan Board of Health. He was the first to point out the phenomenon of concussion of the nerves as distinguished from that of the nerve centres, a condition which had previously been confounded with congestion or inflammation. Dr. Parker made several important discoveries in practical surgery, among which were the operation of cystotomy for the relief of certain cases of chronic cystitis and that for the cure of abscess near the vermiform appendix, called at that time perityphlitis.

PARKER, SIR WILLIAM (1781-1866). An English admiral, born at Alington Hall, Staffordshire. He went to sea when 12 years old on the *Orion*, which shared in Lord Howe's victorious engagement with the French fleet in 1794. He was promoted to be lieutenant in 1799 and commander the same year. As commander of the *Amazon* he was engaged in arduous service on the Portuguese and Spanish coasts and made a notable capture of the French frigate *Belle Poule* (1806). As captain of the *Warspite* he was senior officer on the Grecian coast in 1828. He was made a rear admiral in 1830 and was knighted in 1834 for his services aboard the flagship *Asia* during the three preceding years. He remained in England as an Admiralty lord until 1841, when he was made vice admiral in command in the East Indies, and his prompt action in capturing the ports and blockading the mouth of the Grand Canal brought the Chinese war to an end in 1842. On his return to England in 1844 he was made Baronet. In 1845-52 he was commander in chief in the Mediterranean, and in 1857 he retired. He was created admiral of the fleet in 1863. He had great influence on the navy as a strict though discriminating disciplinarian, and he was often consulted by the Admiralty lords on questions of naval policy. It was mainly through his efforts that the system of continuous service was adopted.

PARKER, WILLIAM BELMONT (1871-). An American editor. He was born at Hasbury, England, and graduated from Harvard in 1897. After four years as assistant editor of the *Atlantic Monthly* he served as literary adviser or editor with Houghton, Mifflin, and Company (1902-04), the Associated Sunday Magazines (1906-08), the *World's Work* (1908), the Baker and Taylor Company (1909-12), and the Century Company (1912). Between 1904 and 1908 he taught English at Harvard and Columbia. In 1912 Parker became business manager of the *Churchman*. He edited Lowell's *Anti-Slavery Papers* (1903), Sir Philip Sidney's *Certain Sonets* (1904), and *Complete Poems of Edward Rowland Sill* (1906); was joint editor of the *Letters and Addresses of Thomas Jefferson* (1905); wrote *Edward Rowland Sill: His Life and Work* (1915); and contributed to magazines.

PARKER, WILLIAM KITCHEN (1823-90). An English naturalist and morphologist, born at Dogsthorpe, near Peterborough. He studied medicine at King's College, London, and began to practice in 1849. In 1873 he was appointed

Hunterian professor of comparative anatomy in the Royal College of Surgeons, conjointly with Prof. W. H. Flower. His chief and most suggestive work was on the comparative osteology of the higher vertebrates, from amphibian to mammal. He constantly dwelt on the developmental side and on the phylogeny of the vertebrates, making many improvements in the classification of the types he studied. His larger monographs were: *Monograph on the Structure and Development of the Shoulder-Girdle and Sternum in the Vertebrata* (1868), and memoirs on the skull of the Batrachia (1878 and 1880), the urodelous Amphibia (1877), the common snake (1878), sturgeon (1882), *Lepidosteus* (1882), *Edentata* (1886), *Insectivora* (1886), and an elaborate paper on the development of the wing of the common fowl (1869). His general works were *Morphology of the Skull* (1877) and *On Mammalian Descent* (1885). He was the father of Thomas Jeffery Parker.

PARKERSBURG. A city and the county seat of Wood Co., W. Va., 94 miles southwest of Wheeling, on the Ohio River, at the mouth of the Little Kanawha, and on the Baltimore and Ohio, the Baltimore and Ohio Southwestern, and the Little Kanawha railroads (Map: West Virginia, C 2). The city rises gradually from the water's edge, the limits extending for some distance on both rivers. A railroad bridge spans the Ohio at this point, 1¼ miles long, and two others span the Kanawha, all being imposing examples of engineering. The city has a fine public park, Carnegie library, Washington High School, Academy of the Visitation Federal building, courthouse, city hall, and Logan Children's Home. Blennerhasset Island and Fort Boreman, both of historic interest, are in sight of the city. There are regular steamboat lines to important river ports. The city is favorably located in the centre of a fertile agricultural region and has an active trade. There are several noted medicinal springs near the city, petroleum and gas wells, and coal and clay deposits of great value. The industrial interests are extensive. There are lumber mills, iron foundries, manufactories of boilers, gas engines, shovels, steamboats, bottles, vitrolite glass, and paving blocks, machine shops, furniture and chair factories, oil refineries, veneer and panel works, oil-well-supply works, flouring mills, etc. Settled in 1773, Parkersburg was first incorporated in 1820 and in 1863 was chartered as a city. In 1911 the commission form of government was adopted. The water works are owned and operated by the municipality. Pop., 1900, 11,703; 1910, 17,842; 1914 (U. S. est.), 19,719.

PARKES, PARKS, SIR HARRY SMITH (1828-85). A British diplomatist, born in the Parish of Bloxwich, near Walsall, in Staffordshire, England. Left an orphan in tender years, he was educated at King Edward's Grammar School, Birmingham. In 1841 he went to Macao, China. By his energy and diligence he rose to be British Consul at Canton. On Oct. 8, 1856, the Chinese seized the British ship *Arrow*, taking therefrom 12 Chinese sailors. Parkes's vigorous protest and Mandarin Yeh's defiant refusal to make amends led, in December, 1857, to the bombardment and occupation of Canton by the British forces, who were aided by the French. In July, 1860, Parkes joined Lord Elgin in the Anglo-French punitive expedition to north China. After the capture of Tientsin, August 24,

Parkes, with 25 men, proceeding to Tungchow under a flag of truce, was captured and imprisoned. Though suffering torture, he sent word to his chief to make no delay or compromise and to take no account of him. The allies arrived in Peking October 6, and half of the prisoners—those not already murdered or starved—were delivered up October 9; but, in punishment of the government's treachery, the Emperor's summer palace was pillaged and destroyed. Parkes was knighted in 1862, became Consul at Shanghai, and in 1865 was appointed British Minister to Japan. For 18 years in this office he enjoyed extraordinary popularity with his countrymen and was always a stalwart upholder of British interests. He was a powerful element in the modern history of Japan, fearless, truthful, and a despiser of the shams and hypocrisies which marked the old school of Japanese statesmanship. In 1882 he was made G. C. M. G. He was appointed Minister to China in 1883 to succeed Sir Thomas F. Wade, and in the following year he also became Minister to Korea. He visited Seoul and negotiated a treaty there; but after the Tongking question and diplomacy, in which "he fired out the Tsung-li Yamen" (q.v.), he died of overwork, March 22, 1885. He was buried at Whitechurch in England. A marble bust of Parkes was unveiled in 1887 by Sir Rutherford Alcock in St Paul's Cathedral in London, and in April, 1890, his was the first public statue unveiled in Shanghai. Consult his *Life*, by Stanley Lane-Poole (London, 1894).

PARKES, SIR HENRY (1815-96). An Australian statesman. He was born at Stoneleigh in Warwickshire, England, was compelled by his father's poverty to earn his own living from the time he was 11 years old, and was entirely self-educated. When 24 years old, he emigrated to Australia, and for some years worked as a farm laborer in New South Wales. He became noted as a political agitator on the side of the Anti-Transportation of Convicts party; founded the *Empire*, a Liberal journal, towards the close of 1850; was elected to the New South Wales Parliament in 1856, and thereafter became identified with the national history of Australia. After holding ministerial rank in Sir James Martin's cabinet he formed, in 1872, his own first administration, holding the post of Premier during five separate governments, the last terminating in 1891, in which year he consummated, as President of the National Convention held at Sydney, the great work of his life, viz., the federation of the various states of Australia and Tasmania—an accomplished fact within a decade afterward. (See AUSTRALIAN FEDERATION.) The most important of his books are: *Australian Views of England* (1869); *Federal Government in Australia* (1890); *Fifty Years in the Making of Australian History* (his autobiography, 1892); *An Emigrant's Home Letters* (1897). Consult C. E. Lync, *Life of Sir Henry Parkes* (London, 1897).

PARKESBURG, pärks'bürg. A borough in Chester Co., Pa., 45 miles west of Philadelphia, on the Pennsylvania Railroad (Map: Pennsylvania, K 8). It has large greenhouses, iron and chemical works, a planing mill, and flour mills. The surrounding country is adapted to farming and dairying. Pop., 1900, 1788; 1910, 2522.

PARKHURST, CHARLES (1845-). An American Methodist Episcopal clergyman and

editor, born at Sharon, Vt. He graduated from Dartmouth College in 1878 and studied for a time at Andover Theological Seminary. He had already held several pastorates and continued to fill pulpits in Vermont, New Hampshire, and Massachusetts until 1888, when he was elected editor of *Zion's Herald* of Boston.

PARKHURST, CHARLES HENRY (1842-). An American Presbyterian clergyman and social reformer. He was born at Framingham, Mass., graduated from Amherst College in 1866, and for two years was principal of the Amherst High School. Theology he studied at Halle (1869-70) and at Leipzig (1872-73), periods separated by teaching at Williston Seminary. In 1874 he became pastor of the Congregational Church at Lenox, Mass., and in 1880 was called to the Madison Square Presbyterian Church, New York. Notably effective as a preacher, even when in his seventies, Dr. Parkhurst had early attracted attention by sermons practical, terse, and fearless. He was as well known, however, for his work in the furtherance of civic and social righteousness. In 1891 he was made president of the Society for the Prevention of Crime. Subsequently the investigations made by this society into the conditions of vice existing in New York City under police protection resulted (1894) in the appointment by the State Senate of the Lexow Committee (See LEXOW, CLARENCE.) In 1915 the Presbyterian General Assembly, misinterpreting a statement Dr. Parkhurst had made regarding prohibition, censured him in his absence and without discussion. From Amherst, of which he served as trustee from 1892 to 1902, he received the degrees of D.D. and LL.D. Besides contributions to the periodical press, he published: *Forms of the Latin Verb Illustrated by the Sanskrit* (1870); *The Blind Man's Creed, and Other Sermons* (1883); *The Pattern on the Mount, and Other Sermons* (1885); *The Question of the Hour* (1886); *The Fellowship of Suffering* (1891); *Our Fight with Tammany* (1895); *Talks to Young Men and Talks to Young Women* (1897); *Guarding the Cross with Krupp Guns* (1900); *The Sunny Side of Christianity* (1901); *A Little Lower than the Angels* (1908); *The Pulpit and the Pew*, Yale Lectures on Preaching (1913).

PARKHURST, JOHN (1728-97). An English Bible scholar. He was educated at Rugby and Clare Hall, Cambridge, and took orders, but received no preferment, spending his life in retirement and study. He published a *Hebrew and English Lexicon* (1762), to which he added in later editions a Hebrew grammar and a Chaldee grammar; a *Greek and English Lexicon to the New Testament*, with a Greek grammar (1769); and treatises against Wesley's doctrine of assurance (1753) and Priestley's views concerning the divinity and preëxistence of Jesus Christ (1787). Parkhurst's lexicons had much merit, but were marred by fantastic theories which he adopted from John Hutchinson the English theologian (q.v.), who held that the Hebrew Bible contained the elements of all philosophical truth. The edition of his Hebrew lexicon published in 1823 contains his life.

PARKIN, GEORGE ROBERT (1846-). A Canadian educator and author. He was born at Salisbury, New Brunswick, and was educated at the University of New Brunswick and later at Oxford University, England. He was prin-

cial of the College School at Fredericton for several years and began to take an active interest in the "Imperial federation" question, upon which subject he spoke in various parts of the Empire. In 1895-1902 he was principal of Upper Canada College, Toronto. Afterward he was made organizing representative of the scholarship trust founded by the will of Cecil Rhodes (q.v.). His publications include: *Imperial Federation* (1892); *Round the Empire* (1892); *The Great Dominion* (1895); *Life and Letters of Edward Thring* (1898); *Life of Sir John A. Macdonald* (1906); *The Rhodes Scholarships* (1912).

PARKINSON, JAMES (1755-1824). An English physician and paleontologist. He studied medicine under John Hunter and practiced in Hoxton from about 1785. Parkinson was a fellow of the Royal College of Surgeons and one of the original members of the Geological Society of London (1807). He also took an active part in politics, was a radical and a reformer and opposed to the government's policies, and besides he was greatly interested in geology and paleontology. In all these fields he was an author. Among the more important of his writings are his report on a case of appendicitis, which was the first article (1812) on the subject in English, and also the first in which perforation was recognized as the cause of death; *Mad-houses* (1811), his report on insane asylums and suggestions for correcting the poor condition of these institutions; his classic description of paralysis agitans (Parkinson's disease) in *An Essay on the Shaking Palsy* (1817); *Organic Remains of a Former World* (3 vols., 1804, 1808, 1811; new ed., 3 vols., 1833) and *Outlines of Oryctology* (1822), both standard; and his books on home treatment: *The Villager's Friend and Physician* (1800; 2d ed., 1802); *Medical Admonitions to Families* (1803; 5th ed., 1807).

PARKINSONIA (Neo-Lat., named in honor of John Parkinson, an English botanist of the seventeenth century). A genus of plants of the family Leguminosæ. *Parkinsonia aculeata* is a West Indian, Texas, and California shrub or small spiny tree with pinnated leaves, and large yellow flowers spotted with red. When in flower it is one of the most splendid objects in the vegetable kingdom. It is often used for hedges; hence its name Barbados flower fence. The bark yields a beautiful, white, short, but rather weak fibre, which might be used for paper making. *Parkinsonia microphylla* and *Parkinsonia torreyana*, both commonly known as Palo Verde tree or green-barked acacia, are small trees from western Texas to California and south into Mexico.

PARKINSON'S DISEASE. See PARALYSIS AGITANS.

PARKMAN, FRANCIS (1823-93). A distinguished American historian, born in Boston, Sept. 16, 1823. Much of his boyhood was spent on the border of the Middlesex Fells, a rough and rocky woodland. He graduated with high rank at Harvard in 1844 and then studied law for two years in the Harvard Law School, but never practiced. Having become interested in American history, he selected, as his life work, the writing of the story of the rise, decline, and fall of the French power in America. With this thought in mind, he at once began to prepare himself for his great task. In his vacations he visited historic scenes connected with

the struggle between the French and the English and made a study of several Indian tribes yet remaining in New England, New York, and southern Canada. In 1842 he journeyed to Italy in search of health and there spent some time in a monastery of the Passionists. In 1846, feeling the need of seeing Indians who were still in an entirely primitive state, he traveled westward with a friend and in company with a tribe of Dakotas spent several months in the Black Hills, in the Platte River country, and on the eastern slopes of the Rocky Mountains. An account of this expedition appeared the next year in the *Knickerbocker Magazine*, under title of "The Oregon Trail," and was republished two years later in book form as *California and the Oregon Trail*.

The hardships he endured while in the West resulted in the breaking down of his health, and he remained a semi-invalid all the rest of his life. Despite this misfortune he continued in his work and succeeded, in 1851, in bringing out the first of his historical works, *The Conspiracy of Pontiac* (2 vols.). Fourteen years elapsed before he was able to complete a second. A part of this period he devoted to collecting material, both in America and in Europe, and to writing a novel, *Vassall Morton*, which appeared in 1856, but which met with little success. During much of the time, however, his health was so bad that he was forced to abstain almost entirely from literary work. To occupy his time he interested himself in horticulture and acquired such a knowledge of the subject that in 1866 he published *The Book of Roses* and in 1871 was made professor of horticulture in the Bussey Institution (Harvard University). This position, however, he resigned the next year. In 1865 the second of his historical works, *Pioneers of France in the New World*, appeared. This volume embodies in noble and enduring prose the leading facts in regard to the ill-fated venture of the French in Florida and the story of Champlain and New France. It was followed in 1867 by *The Jesuits in North America*, in 1869 by *La Salle and the Discovery of the Great West*, in 1874 by *The Old Régime in Canada*, in 1877 by *Count Frontenac and New France under Louis XIV*, in 1884 by *Montcalm and Wolfe* (2 vols.), and in 1892 by *A Half-Century of Conflict* (2 vols.), which completed the series. Besides these works, he published also an *Historic Handbook of the Northern Tour* (1885), and numerous articles, many of them advance chapters from his histories, in magazines and other periodicals. During all this time his health continued to be precarious, and his eyes were so weak that his material, collected for him by hired copyists, had to be read to him, and he was forced to rely almost entirely upon dictation instead of the pen. The story of his struggle against such odds is one of the most heroic in the history of literature. He died at his home at Jamaica Plain, Mass., Nov. 8, 1893, the year following the completion of his great work.

Authorities are unanimously agreed that to Parkman belongs a place with such historians as Bancroft, Prescott, and Motley, and many are of the opinion that his work will live longer than any other that has yet been done in the field of North American history. In him, in fact, existed a combination rare among historians; for while he was a scholarly and indefatigable investigator, he was at the same

time a consummate literary artist. His search for material was one of the most exhaustive that any historian has ever made. He seven times visited Europe, and while there sought out the documents bearing upon the period about which he intended to write. He visited also all the important localities mentioned in his story, and his knowledge of the Indians and of the wild life of the woods was invaluable. Parkman was the first great author who really understood the Indian's character and motives. Courage, whether of priest, soldier, or savage, appealed powerfully to the historian, whose own life was an example of such rare heroism. In a paper that was read after his death and printed in the Massachusetts Historical Society's *Proceedings* for 1893, Parkman described his sufferings and the unfavorable conditions under which he labored. Consult: C. H. Farnham, *A Life of Francis Parkman* (Boston, 1901); H. D. Sedgwick, *Francis Parkman* (ib., 1904); H. C. Vedder, *American Writers of Today* (new ed., New York, 1910).

PARKS, LEIGHTON (1852-). An American Protestant Episcopal clergyman. He was born in New York City and graduated from the General Theological Seminary in 1876. Ordained a priest the next year, from 1878 to 1904 he was rector of Emmanuel Church, Boston. He then became rector of St. Bartholomew's Church, New York, succeeding David H. Greer, who had been elected Bishop of the diocese. Dr. Parks, who became noted for his direct and uncompromising preaching to one of the wealthiest congregations in the country, published *The Winning of the Soul and Other Sermons* (1893) and *Moral Leadership and Other Sermons* (1914).

PARKVILLE. A city in Platte Co., Mo., 10 miles by rail south-southwest of Kansas City, on the Missouri River, and on the Chicago Great Western and the Chicago, Burlington, and Quincy railroads (Map: Missouri, B 2). It is the seat of Park College, founded in 1875, and contains a Carnegie library. There are stone quarries and flour mills, and willows for rippingrap are shipped from here. Pop., 1910, 765.

PARLEMENT, *Fr. pron.* pärl'män'. This meant originally a colloquy or conference. It was then used to designate a session of the Curia Regis. Finally it came to be the name for the supreme court. The Parlement of Paris, the most influential and celebrated of the French parlements, had its origin in the Curia Regis of the Frankish kings, an assembly consisting of the lay and ecclesiastical dignitaries of the court which met under the presidency of the King or his representative and exercised a wide though undefined jurisdiction. Broadly speaking, its powers extended to all cases involving the royal interest, but it also heard appeals from inferior courts where delay or denial of justice was concerned. Under the Carolingian monarchs it was the court for the trial of cases involving the high nobility, and its jurisdiction was also extended over all persons living under the royal protection. In the course of time the Curia Regis fell apart into three separate bodies: the *conseil de roi*, the *chambre des comptes*, and the Parlement proper, which first appears under St. Louis. Under Philip the Fair the *légiſtes*, or members of the learned bourgeoisie, began to enter the Parlement, which up to then had been composed exclusively of the

lay and ecclesiastical nobility. These came to constitute a very important element in the body, as is indicated by an ordinance soon after 1296, which ordered that 18 laics and 16 clerks should always be in session for the doing of judicial business. The Parlement at this time comprised three chambers: the *grand' chambre*, or full Parlement, meeting for the rendering of decrees; the *chambre des enquêtes*, to which was referred the greater mass of detailed work, such as preliminary investigation and the sifting of testimony; and the *chambre des requêtes*, which received the petitions of those desiring to come within the jurisdiction of the Parlement. From 1417 to 1436, while Paris was in the hands of the English, the Parlement was in session at Poitiers. In 1467 the irremovability of members of Parlement was practically established. The method of admission at this time was by royal appointment from a list submitted by the Parlement, but frequently the kings exercised the power of direct appointment. Under Francis I the principle of purchase became general; nominations henceforth ceased, and membership, as a rule, passed from father to son, resulting in the establishment of a so-called nobility of the robe, class conscious, jealous of its prerogatives, and careful of furthering its interests. The salary was small, and the chief income of the magistrates was derived from fees, which were very high. The kings at various times sought to increase their revenue from the sale of offices, by increasing the number of members of Parlement, or even the number of chambers, there being at one time no less than nine of these in the Parlement of Paris. In 1604 the so-called Paulette was introduced, in accordance with which members of Parlement paid an annual fee of $\frac{1}{10}$ of their income, in return for which their office on death passed to their heirs.

The provincial parlements had their rise after the Hundred Years' War. As the great fiefs were reunited with the crown, parlements were established in the local capitals to perform the same judicial functions as the Parlement of Paris did within its jurisdiction. The Parlement of Toulouse was established in the thirteenth century, but was dissolved after some time and was not definitely reestablished till 1443. The other local parlements, with the date of their foundation, were as follows: Grenoble, 1453; Bordeaux, 1462; Dijon, 1477; Aix, 1501; Rouen, 1515; Rennes, 1554; Pau, 1620; Metz, 1633; Besançon, 1676; Douai, 1686; Nancy, 1775. The parlements were all on a basis of equality in that each was supreme within its jurisdiction, but a certain predominance was enjoyed by the Parlement of Paris, whose decrees after 1474 seem to have been binding in any part of the Kingdom without the *visa*, or confirmation, of the local Parlement. For the facilitation of business the Parlement sometimes sent out a number of its members to hold court in different places. These courts were known as *Grands Jours* and constituted practically courts of assize.

The political importance of the Parlement of Paris dates from the reign of Charles VI. Under Louis XI it began definitely to put itself into opposition to the royal will in matters of legislation and administration by attempting to modify the text of the royal edicts submitted to it for registration (*enregistrement*) or by rejecting them altogether. The process of regis-

tration, which in the beginning was merely formal and largely in the nature of an act of record, had come in time to be regarded by the Parlement as essential for the validity of all royal decrees. The kings met the opposition by letters of "jussion" commanding the Parlement to register, frequently too by imprisonment and exile. Before the end of the sixteenth century the common form was by means of a royal bed of justice (q.v.), where the King appeared in solemn state and ordered the Parlement to register the obnoxious decree. The parlements exercised great influence during the period of the civil wars when they were strongholds of catholicism. They submitted, however, to Henry IV. The Parlement of Paris sought to assert its authority during the reign of Louis XIII, but failed before the masterful will of Richelieu. Under Louis XIV Parlement, after playing a leading part in the troubles of the Fronde (q.v.), was restricted entirely to its judicial functions. After that monarch's death, however, the Parlement declared his will invalid and vested the regency in the Duke of Orléans. Thereafter it was engaged in continuous struggles against the crown in the hope of regaining its former power. It was conspicuous in the Jansenist controversy in connection with the bull *Unigenitus* (see JANSENISM) and was the bitter enemy of the Jesuits, whose expulsion it brought about. The conflict between the Parlement and the crown culminated in the coup d'état of 1771, when the Chancellor Maupeou declared all the offices of the Parlement vacant and organized a new body whose authority was greatly curtailed by the establishment of six superior courts in the territory formerly under the jurisdiction of the Parlement. Purchase and fees were abolished. In spite of the fact that the change was on the whole for good, the new Parlement—the Parlement Maupeou, as it was called—was extremely unpopular, and when Louis XVI succeeded to the throne he restored the old magistrates. The quarrels with the crown nevertheless continued, the Parlement making itself the mouthpiece of the new ideas of popular rights, national sovereignty, and thoroughgoing reform. Its protestations, however, were not entirely sincere, as was evidenced at the summoning of the States-General in 1787, when it showed itself no less jealous of its prerogatives than the nobility or the clergy. It lost thereby the popularity which it had enjoyed for some time, and in 1790 the Parlement of Paris, with the provincial parlements, was abolished by the National Assembly. As judicial tribunals the French parlements take a very high position among such institutions in history. Though narrow in spirit as far as concerned their privileges as a caste, they nevertheless were usually just in the decision of cases and were largely instrumental in unifying the customary law of France.

PARLEMENTAIRE, pär'lë-män'târ'. See PARLEY.

PARLER, pär'lër, PETER (c.1333-c.97). The most famous and successful of a family of German architects. He was born probably in Cologne, and his name seems to have been corrupted in Bohemia from Arler to Parler, possibly under the influence of *Parlierer* or *Polier*, a German word used among masons and bricklayers, signifying "foreman." Like his father, Heinrich, he got his early training in Cologne. In 1356 he was architect on the Prague Cathedral, of which he built the choir. His brother, JOHANNES, became master architect of the cathedral of Freiburg in 1359. Some members of the family were known by the name of Von Gmünd. All are classified by Klemm in the *Allgemeine deutsche Biographie*. Consult Neuwirth, *Peter Parler von Gmünd und seine Familie* (Prague, 1891).

PARLEY (OF. *parlee*, turn of speech, from *parler*, to speak, from ML. *parabolare*, to discourse, from Lat. *parabola*, comparison, speech, parable). In military affairs this term is used to describe the conversation between antagonists, which may be introductory to an exchange of prisoners, burial of dead, care of wounded soldiers, or any other nonhostile intercourse of belligerent armies. Hostilities are temporarily suspended in the vicinity near where the parley takes place. A parley is usually preceded by a flag of truce, although it may be preceded by a roll of drums, known as *beating a parley*. In the *Rules of Land Warfare, United States Army, 1914*, the word "parlementaire" is officially adopted to designate the agent in the nonhostile intercourse of belligerent armies. His duties include every form of communication with the enemy in the field. The adoption of the word "parlementaire" was considered absolutely essential in order to avoid confusion and because all other nations, including Great Britain, utilized the word. In the past this word was translated at times to mean the agent or envoy only; at other times, the agent and emblem, or both. To call the parlementaire "the bearer of the flag of truce" is not in reality correct, because he seldom, if ever, actually carries it. In the annex to The Hague Convention, No. IV, of Oct. 18, 1907, are found the following rules relating to the methods of conducting the intercourse or parley, and the rights and restrictions of the agent or parlementaire: H. R. xxxii., "A person is regarded as a parlementaire (bearing a flag of truce) who has been authorized by one of the belligerents to

enter into communication with the other, and who advances bearing a white flag. He has a right to inviolability, as well as the trumpeter, bugler, or drummer, the flag bearer, and interpreter who may accompany him." H. R. xxxiii. "The commander to whom a parlementaire is sent is not obliged to receive him under all circumstances. He may take all the necessary steps to prevent the parlementaire from taking advantage of his mission to obtain information. In case of abuse he has the right to detain the envoy temporarily." H. R. xxxiv. "The parlementaire loses his right to inviolability if it is proved in a clear and incontestable manner that he has taken advantage of his privileged position to provoke or commit an act of treachery." Consult *Rules of Land Warfare, United States Army, 1914*, published by the War Department (Washington, 1914).

PARLEY, PETER. See GOODRICH, SAMUEL GRISWOLD.

PARLIAMENT, pärli-ment (OF., Fr. *parlement*, discourse, conference, legislature, from *parler*, to speak) The name of the legislative assembly of Great Britain and Ireland. The legislative assemblies of Scotland and of Ireland previous to the union with England (1707) and Great Britain (1800) respectively bore the name of Parliament. This is also the designation of the Legislatures of the Dominion of Canada and of the Commonwealth of Australia. The parliaments (*parlements*) which existed in France before the revolution of 1789 were not legislative but judicial bodies. The word was first used by Matthew Paris in 1246, but only gradually replaced the terms by which the councils of the English King had previously been known. Moreover, even when so called, Parliament had not at first the privileges and functions which it exercises to-day. Modern Parliament has developed slowly from the Witenagemot of Anglo-Saxon times. This body was composed of princes, prelates, ealdormen, and a varying number of royal nominees. It met thrice yearly, had the power of electing and deposing kings, gave counsel and assent in matters of legislation, and was the supreme court of justice for the Kingdom. It was in no sense a representative and legislative body, but a council of *witan*, or wise men, assembled to advise the King. After the Norman Conquest the Witenagemot gradually lost its old significance, together with its name, and was merged in the Great Council, an assembly to which in theory every tenant in chief of the King belonged. This was generally attended only by royal officials, the great prelates, earls, and those barons who were individually summoned. The powers of the body were three: it held a somewhat loose control over taxes, it gave consent to laws proposed by the King, and it acted as a court of justice. The first function became of some importance by the end of the twelfth century, when the idea that taxation and representation go hand in hand first germinated; the second was exercised to good purpose in great crises like the conflict between Henry II and Thomas à Becket; but the third developed earliest and gave the Council its peculiar character.

With the granting of the Great Charter on June 15, 1215, by King John, the national assembly entered upon an important period of transition (See MAGNA CHARTA). The commons, especially the citizens of London, had

given important aid to the barons in their struggle, and the latter obtained certain privileges, personal and commercial, for them. More important was the fact that for the first time the nobles and commons were thus united against the crown. The Great Charter provided that no scutage or aid, other than for delivering the King from captivity, for knighting his eldest son, or marrying his eldest daughter, should be levied without the consent of the Great Council, which was to be summoned at least 40 days before the appointed date for meeting, so that all might have time to attend. The document took no notice of the representative principle, however, and the minor barons subsequently regarded themselves as exempt from attendance at the Great Council because they were no longer entitled to summons by special writ. But, curiously enough, John had already recognized the principle of representation in 1213, when he summoned to the Council of St. Albans the reeve and four men from each vill on the royal demesne. This is the first occasion where all three estates—nobles, clergy, and commons—met at the same time. Recognition had thus been gained for the ideas of representation, election, and concentration in a central assembly, but until 1254 the experiment seemed abortive. In that year Queen Eleanor and Earl Richard of Cornwall, regents during the absence of Henry III in Gascony, called a council to meet at Westminster, at which were present two knights, chosen at the shire moot of each shire, to report the amount their constituents were willing to grant the King for waging war. This element was to be of great importance in the development of Parliament, since the knights of the shire henceforth furnished leaders for the commons, and, many of them being nearly related to the nobles, they enabled the two estates to unite in opposition to the crown.

In spite of the part played by the commonalty in these early attempts at constitutional reform, the tendency of the time was oligarchical. This is clearly shown by the struggle between Henry III and Simon de Montfort (qqv). Though in the course of it distinction was first made between the representatives of shires and of boroughs, Simon called upon the commons only to further his ambitious plans and even then gave them no voice in the formation of his governmental scheme. In 1258 a form of provisional government was ratified, embodied in the Provisions of Oxford (qv), which vested the balance of power in a committee, a majority of which were barons. Henry endeavored to evade the Provisions, but Simon defeated him in battle at Lewes in May, 1264, and in January, 1265, there met at Westminster a Parliament to which Simon had summoned not only two knights from each shire, but also two burgesses or citizens from 21 boroughs or cities mentioned by name in the writ. Thus for the first time the third estate, made up of county freeholders and burgesses, was fully represented in a national assembly. Nevertheless, the importance of Montfort's act has been somewhat exaggerated. In the first place the Parliament was not truly representative. Of the lords, who as a whole were unfavorable to his cause, only five earls and 18 barons were summoned, while of the clergy, who were his supporters, there was a very disproportionate number. Furthermore, it is doubtful whether the parliamentary

representation of the third estate was intended to be permanent. Yet Simon cleverly adapted existing materials to his own ends and showed the lines on which a real Parliament was to be formed. Meanwhile there was developing on the part of the commons a tendency towards organized opposition to excessive taxation and a somewhat indefinite theory that a grant of supply should receive the consent of Parliament. It was a step in advance that Henry III recognized the necessity of support from the barons and that both parties no longer ignored the rights of the towns.

To Edward I belongs the honor of completing the work of founding Parliament. During the first 20 years of his reign, though there was no important advance, he summoned representative assemblies occasionally. Whether consciously or not, he seems to have been experimenting in order to determine the proper representation of the various classes which had crystallized during the struggle of the last reign. In 1294 the right of the clergy to give consent to taxation was formally acknowledged. In the following year Edward was beset with difficulties on account of his wars with Wales and France. He needed money and accordingly summoned representatives of the three estates, the consent of which he now recognized as essential in the matter of taxation. This assembly, which met in November, 1295, is known as the Model Parliament. To it came, aside from the bishops and the abbots, the earls and the barons, two knights from each of 37 shires and representatives of 110 cities, boroughs, and towns. The Parliament was held at Westminster, which became from this time the regular meeting place of the assembly. That Parliament was not formed into three chambers rather than into two was due to the attitude of the lower clergy, who soon withdrew and voted grants of money in their own assembly or convocation. It was not till the reign of Edward III that the definite separation into two Houses took place. The knights at first vacillated between the lords and the commons, but in 1332 is found the first clear reference to the arrangement which after 1339 was permanent, the lords forming the Upper House, the knights and burgesses the Lower.

If the thirteenth century marks the formation, the fourteenth century is especially notable for the development of the privileges of Parliament. In 1322 Edward II definitely acknowledged that "the matters to be established for the estate of our lord the King and of his heirs, and for the estate of the realm and of the people, shall be treated, accorded, and established in parliaments by our lord the King, and by the assent of the prelates, earls, and barons, and the commonalty of the realm, according as hath been hitherto accustomed." Though the position of the Lords and Commons was thereby recognized, the latter had yet to struggle for actual power. Laws were still made by means of petitions to the King, and only the King could proclaim them. A purely formal survival of this condition explains the phraseology of the laws in our own time, which, according to the stereotyped preamble, always emanate from the crown, Parliament merely consenting. The Hundred Years' War (q.v.) still further increased the power of Parliament, because with the necessity of appealing to the people to meet the enormous expenses which

that war entailed upon the government, it became customary to demand from the King a redress of grievances before granting him a subsidy. The advance in privilege during the period from the accession of Edward II to the death of Henry V may be further summarized as follows: 1. By the Ordinance of 1311, succeeded by the Acts of 1330 and 1362, it became the rule to summon parliaments every year. This provision was often evaded, but regular and frequent assemblies were nevertheless held throughout the fourteenth and fifteenth centuries. 2. From 1340 taxation without the consent of both Houses was illegal. 3. After 1407 the Commons possessed the preponderating voice in making money grants. 4. Parliament began to exercise the right of supervising expenditure, which involved not only the audit of accounts, but also the impeachment of royal officials. This was first done by the Good Parliament (q.v.) in 1376 and constituted an early but important step towards ministerial responsibility.

The Wars of the Roses proved in a manner detrimental to the development of Parliament, since the destruction of the powerful nobles left the Commons unaided in their struggles against the crown. Yet the practice of introducing legislation by means of bills instead of petitions, which was begun in the reign of Henry V, became firmly established in the reign of Henry VI and really laid the foundations for the subsequent power of Parliament. During the earlier part of the Tudor period Parliament was denied even the semblance of power, but Thomas Cromwell showed Henry VIII the way to use it for his own ends while observing the letter of the law. Subsequently the Tudors were despots by means of their control over Parliament. The course they followed was this: (1) occasionally they employed the old device of dispensing with Parliament altogether; but (2) they found a safer method in creating a number of small boroughs, later called "rotten boroughs," and narrowing the right of franchise; (3) they secured the nomination of the Speaker of the Commons and made the Secretary of State a member of that body; (4) as a last resort they fell back upon the royal prerogative of government by proclamation. The Reformation also worked towards the same end, since the loss of the 27 abbots and priors to the Upper House left the temporal peers in the majority and gave the crown the opportunity of controlling the Lords by means of new creations by letters patent. At first temporal peers had been the great tenants in chief; from the time of John they were those barons who received personal summons to the Great Council; under Edward I such barons were confirmed in their hereditary rights; but not till the device of creation by letters patent was established did the hereditary peerage in the modern sense appear. Instances of such creations are found as early as the reign of Stephen, but they were rare till the time of Richard II. Since the Reformation the spiritual Lords have been the two archbishops and the several bishops holding English dioceses. In connection with the House of Lords it is necessary to note the peculiar function of acting as a court of last resort, a right which it has kept since the separation of the Privy Council from Parliament in the reign of Richard II.

With the accession of James I (q.v.) in 1603

began the last great struggle between Parliament and the crown. The Tudors had been able to retain their personal popularity and to rule somewhat despotically because they held to a definite public policy. The Stuarts, in default of this, obstinately asserted the principle of divine right, which was peculiarly obnoxious to the Puritan party, at that time just becoming strong. Moreover, James was a foreigner and understood the needs of Scotland better than those of England. The struggle with Parliament continued throughout his reign and that of his son, Charles I (q.v.), resulting in the Great Civil War and the rule of Oliver Cromwell (q.v.) The strife centred about the right of taxation and the right to impeach royal officials or about responsibility of ministers to Parliament. In both of these matters the House of Commons ultimately won a complete victory, as also in the subsidiary question of the inviolability of its own members. Though the army was all-powerful during the Protectorate itself, the Restoration found Parliament in possession of the rights for which it had long struggled. The reign of Charles II was strictly parliamentary, at least as far as outward forms went, and freedom of speech in Parliament was definitely established. In this reign, moreover, the influence of the Lower House was vastly increased by the provision that bills for the grant of supplies must not be amended by the Lords. With Charles II also appeared the cabinet, or body of ministers who lead Parliament and are responsible to it, though as yet this represented no definite party or system. The number of members of the House of Commons for England and Wales, which had been greatly increased by the crown in preceding reigns, now became fixed at 513. This rigidity increased the abuse of rotten boroughs, while new centres of population remained unrepresented. The loss of its power of creating boroughs was a serious blow to the crown, but it still enjoyed great influence by means of appointment to lucrative offices and even grosser forms of bribery.

Though the revolution of 1688 was hardly due to parliamentary struggles, its effect upon the development of the powers of Parliament was far-reaching. The Bill of Rights (1689) marked the end of the long struggle between the crown and the Legislature and established the principle that the right of the throne depends on parliamentary recognition. This was more clearly shown in 1701 by the Act of Settlement, which vested the crown in the Protestant succession. By the Triennial Act of 1694 the life of Parliament—originally limited to a single session but under the Tudors and Stuarts extended in some instances to several years—was limited to three years. This did away with the possibility of the King keeping a subservient Parliament in existence after it had lost the confidence of the nation. The limit was extended to seven years by the Septennial Act of 1716, which is still in force. Not since 1707 has the crown vetoed a measure passed by the two Houses. The eighteenth century is notable for the development of the party system, though the Whigs and Tories had existed under these names since 1679. In connection with the rise of parties appeared the completely developed cabinet government, whereby the crown is compelled to select its ministers from the dominant party in the House

of Commons. The fact that George I was a foreigner and unable to speak English had much to do with this change in government. George III (q.v.), indeed, tried to create a party of his own, but failed. Henceforth the maxim that "the King reigns but does not govern" represents the spirit of the English constitution. In 1707, by the union of Scotland with England and Wales to form the Kingdom of Great Britain, certain changes were made in the composition of Parliament. Scotland received 45 members in the House of Commons, while its peers were to elect for every Parliament 16 representatives from their number to sit in the Upper House. As the crown was restrained from creating new peers for Scotland, the Scottish peerage is gradually becoming extinct. In 1800 the Irish Parliament also ceased to have a separate existence, and Ireland was to be represented in the Parliament of Great Britain and Ireland by one of the four archbishops and three of the 18 bishops sitting by rotation of sessions, by 28 temporal Lords elected for life by the Irish peerage, and by 100 members of the House of Commons. The spiritual Lords lost their seats in 1870, however, in consequence of the disestablishment of the Irish church. The nonrepresentative Irish peers may be elected to the House of Commons, and many, like Lord Palmerston, have had distinguished careers in that body.

In the latter part of the eighteenth century parliamentary corruption became notoriously prevalent. In 1793 the Duke of Norfolk had 11 seats for rotten boroughs in his gift, and many other wealthy men were answerable for a lesser number. Moreover, many great towns had no representatives whatever in the House of Commons. After various abortive attempts at the reform of parliamentary representation by the younger William Pitt and others, the question became acute at the close of the Napoleonic wars and did not cease to agitate the Kingdom during the greater part of the nineteenth century. Legislative measures began with the great Reform Bill of 1832, which was passed after the opposition of the peers had been overcome by the threat of numerous creations. This act remodeled Parliament. In England 143 votes were taken from boroughs and redistributed among the counties and large towns. The county franchise was given to freeholders or copyholders to the value of £10 a year, to leaseholders for 20 years whose annual rent was £50, and to tenants at will who paid £50 a year. The borough franchise was given to all holders of houses to the annual value of £10. For Scotland the number of members was increased from 45 to 53, of whom 30 were to sit for the counties and 23 for the cities and boroughs. The county franchise was given to all holders of property to the annual value of £10, while the borough franchise was made the same as that of England. For Ireland the number of members was raised from 100 to 105. Both the borough franchise and the county franchise were given as in England, except that the occupation franchise in the counties was limited to holders of land to the value of £20 per annum. This provision was designed to prevent the control of the priests, who were much feared after the Catholic Emancipation Act of 1829. With the Reform Bill the parties took new names, the Tories being succeeded by the Conservatives, the Whigs by the Liberals.

ince then Parliament has undergone little change in its essential features, though several form acts have been passed. In 1867 household suffrage was established in boroughs, with lodger franchise at a value of £10; in the unties existing qualifications were reduced one-half, and an occupation franchise at £12 as created. There was also a slight redistribution of seats. In 1872 voting by secret ballot as established. In 1884 there was a thorough distribution of seats, with an attempt to make equal electoral districts, and an assimilation of county and borough franchises. In 1885 the franchise was again somewhat extended so as to include the agricultural laborer, and at present there is nearly universal suffrage in Great Britain and Ireland. Meanwhile the House of Commons has become by far the most important branch of the government. It rules the country absolutely and is quickly responsive to popular demands.

The constitutional crisis which culminated in the Parliament Bill of 1911 may be said to have had a history reaching far back into the nineteenth century, but the latest aspects of the conflict between the two Houses developed after a change of ministries in 1905. Gladstone, indeed, on the occasion of the rejection of the Home Rule Bill of 1893 by the House of Lords, had predicted that the question of relative power thus precipitated would be carried forward eventually to a definite and final issue. After the assumption of control by the Liberal Government in 1905, the House of Lords, which is overwhelmingly Conservative, began to oppose the measures of the Commons, and thus a progressive legislative programme of the Liberals was defeated. In 1906 the education, census, and plural voting bills were thrown out. Premier Campbell-Bannerman, in 1907, said: "It is necessary that the power of the other House to alter or reject bills passed by this House should be so restricted by law as to cure within the limits of a single Parliament at the final decision of the Commons shall prevail." The situation remained unchanged, however, until the revolutionary budget of Lloyd-George was rejected by the Lords in 1909. His action seemed to challenge the supremacy of the Commons in matters of finance, and the question was submitted to the country. The election of 1910 resulted in victory for the Liberal coalition, and the government then insisted that not only should the budget be accepted, but that the constitution should be altered so as to remove the veto power of the Lords. At length, when introducing and defending a bill to this end, stated that the government ought that the continuance of the bicameral system was necessary, but that the predominance of the Commons must be insured. The second chamber should exist for the functions of consultation and revision and in order to prevent undue haste in important legislation. Lord Rosebery immediately endeavored to force all the government by proposing a reform within the House of Lords, introducing representative and democratic elements, but the Liberals decided first to deprive the Lords of their power and then to allow reformation. The death of King Edward, in 1910, caused a delay in the settlement and a moderation of extreme views. A conference of the leaders on both sides was arranged, but after 21 meetings it failed to agree upon a bill, and the government

decided to appeal to the people. The second election also resulted in success for the government, and the Parliament Bill (1 and 2 Geo. V, c. 13) was introduced. This bill had in prospective consideration the substitution of a second chamber "constituted on a popular instead of a hereditary basis" for the existing House of Lords; but in the meanwhile it sought to destroy the absolute veto. It provided that all money bills (such as were so certified by the Speaker), if not passed by the House of Lords, may become law without the concurrence of that House if the Commons insist and the bill receives the royal assent. Public bills, other than money bills or a bill to extend the maximum duration of the Parliament beyond five years, may become law without the consent of the Lords if passed by the Commons in three successive sessions, whether in the same Parliament or not, provided that not less than two years shall have elapsed after the second reading after introduction and the third reading of the final passage. This act changed the length of Parliament from seven to five years. It was adopted after an extremely bitter and dramatic fight between parties, in which public opinion was deeply agitated, the Lords yielding only under the threat that new peers would be created in numbers sufficient to overcome opposition. The government also forced a measure providing for the payment of a salary of £400 to members of the House of Commons.

The following table illustrates the composition of the House of Commons in 1914:

	Counties	Boroughs	Universities	Total members
England.....	234	226	5	465
Wales.....	19	11	0	30
Scotland.....	39	31	2	72
Ireland.....	85	16	2	103
	377	284	9	670

Details concerning the existing system of parliamentary government will be found in the section *Government under UNITED KINGDOM*, but something remains to be said of certain customs of Parliament. The Houses of Parliament or New Palace of Westminster, in which Parliament sits, were opened in 1852, though the assembly has had its abode on that site for six centuries. The former building was destroyed by fire in 1834. The Commons' Chamber is in the north side of the building, the Lords' in the south. About them are the retiring rooms of their respective members, and the residences and bureaus of their officials, aside from a great number of other apartments. Unless sooner dissolved, a Parliament lasts for five years. It meets about the middle of January or early in February, and when it has completed its work it is prorogued, though either House may adjourn for a short time on its own initiative. Business is now rarely completed before August or September. A new Parliament is opened with imposing ceremonies, the hour fixed being usually two o'clock. In the morning the vaults are searched for possible bombs and the like, in memory of the plot of Guy Fawkes (q.v.). The House is opened by the clerk, who is chairman till the Speaker is elected. The first incident of the session is the summoning of the Commons to the Peers' Chamber by the Black Rod, the mes-

senger of the Upper House, to hear the royal message. When the King does not open Parliament in person, this is read by the Lord Chancellor. Before the actual reading of the King's speech the Commons return to their own chamber to elect a Speaker. The Speaker is not a party leader, as in the United States, but is supposed to be strictly impartial and is usually reelected regardless of the party in power. He receives an annual salary of £5000 and has some perquisites, such as an official residence. He ranks as first commoner, and when he retires he is usually rewarded with a peerage and a yearly pension of £4000. The chairman of the House of Lords is the Lord Chancellor, whose official seat is the celebrated woolsack. He is ordinarily a member of the cabinet. Most of the measures introduced into Parliament are government bills, and a vote is taken by the members passing out of different doors into the lobby and being counted in the process. Each party has designated members, known as "whips," who gather the party forces for important divisions in the House of Commons.

Contempt of Parliament. Persons guilty of insults to the dignity, disobedience to the commands, or of infringement of the rules and privileges, of either House of Parliament are held in contempt and are subject to punishment inflicted at the discretion of the House offended. Lord Ellenborough, in the famous case of *Howard v. Gosset* (10 Q. B., 151), stated that either House has "the power to cause the person charged to be taken into custody and to be brought to the bar to answer to the charge." The Chancellor for the Lords and the Speaker for the Commons issues a warrant for the arrest of the offender, who is then brought before the bar to be examined. The power of Parliament to punish contempt was recognized from the first, but controversies arose in the contests between executive and legislative departments. It is unquestionable, ultimately, however, that Parliament and particularly the House of Commons can override any court and inflict punishment for contempt at discretion. Consult E. May, *Constitutional History of England* (London, 1863), and W. R. Anson, *Law and Custom of the Constitution* (Oxford, 1909).

PARLIAMENT, HOUSES OF, or NEW PALACE OF WESTMINSTER. The seat of the British legislature, a great mass of buildings on the Thames in London, built (1840-57) at a cost of \$15,000,000 after plans by Sir Charles Barry, on the site of a previous building destroyed by fire in 1834. The edifice covers an area of 8 acres,

and contains 1100 apartments, 100 staircases, and 11 courts. The exterior, in rich late Gothic style, is made impressive by three massive towers: Victoria Tower, 340 feet high; Middle Tower, 300 feet high; and St. Stephen's or the Clock Tower, 318 feet high. The latter contains a clock with dials 23 feet in diameter and a great bell, Big Ben, weighing 13 tons. The interior of the palace is fitted up with much magnificence. In it are the sumptuous House of Peers and the simpler House of Commons, an octagonal central hall, St. Stephen's Hall on the site of St. Stephen's Chapel (the former meeting place of the Commons), the residence of the Speaker and other officials, the libraries, committee rooms, and lobbies connected with the two Houses, and offices. With the edifice is connected Westminster Hall (q.v.). An unsuccessful attempt to destroy the palace by explosions of dynamite was made in 1885. For illustration, see Plate accompanying the article LONDON.

PARLIAMENT, KNIGHTS OF. See KNIGHTS OF THE SHIRE.

PARLIAMENT, THE ADDLED. The British Parliament which was in session from April to June, 1614, in the reign of James I. It was so named because it was unable to transact any business owing to its dissolution by the King for its refusal to compromise with him on the question of impositions on merchandise.

PARLIAMENT, THE RUMP. See RUMP PARLIAMENT.

PARLIAMENTARY LAW. The body of rules and precedents regulating the procedure of deliberative assemblies. Certain rules of parliamentary procedure have always been found necessary for the accomplishment of the purposes for which deliberative assemblies are called. Experience has shown that restrictions must be placed on individual members in the general interest of the whole body, that mere customary rules are insufficient, and hence regular parliamentary codes must be prepared for the government of deliberative assemblies. In the United States this has become almost a distinct branch of the law, and its mastery is highly essential to the success of the legislator. The necessary officers of a deliberative assembly are a chairman, usually called Speaker, president, or moderator, and a secretary or clerk. It is the duty of the presiding officer to call the meeting to order; to state clearly all questions brought before the assembly; to put motions properly made and in their proper order; to preserve order and enforce the rules of procedure; and to decide questions of order subject to the right of appeal to the whole assembly. These are his primary duties, but he may in addition participate in debate as any other member and vote in case of a tie. It is the duty of the secretary to keep a record of the proceedings of the meeting, including a correct statement of every motion made and the manner in which it was disposed of; the names of members of all committees appointed; a true copy of every resolution passed, with the affirmative and negative votes cast therefor, etc.

Business is or should be brought before an assembly by motion of a member or in the form of a resolution which is presented by a member who at once moves its adoption. If it is a mass meeting called for a particular purpose, a motion is made for the appointment of a chairman, who, upon taking the chair, asks for a state-

ment of the purpose for which the meeting is called. A proposition which is presented to an assembly is usually called a motion if it relates to a matter of secondary importance and a resolution if of greater importance. The difference is of no practical consequence, however, since a resolution may be offered as a motion and a motion may be presented in the form of a resolution. The member upon whose motion the subject under discussion was brought before the assembly, or upon whose report the conclusion of a committee is presented, is entitled to be recognized as having the floor, although another member may have already risen and addressed the chair. No member who has once had the floor is again entitled to it while the same question is before the assembly so long as any member who has not spoken claims the privilege of the floor. From the decision of the chairman as to the claim of two members for the floor an appeal may be taken, or, in first instance, the chairman may refer the question directly to the assembly for decision. It is the custom, except in the United States Congress, to require important motions to be seconded as a means of assurance that the measure has the support of more than one member. The motion is often seconded as a matter of course, even though the person seconding it may not favor it. After the motion has been made and seconded the chairman clearly states it to the assembly and then recognizes the author of the motion as entitled to the floor if he wishes to claim it, otherwise the first member who rises and addresses the chair. The question is now before the assembly and cannot be withdrawn or modified by the mover, if any member objects, except by obtaining leave from the assembly or by moving an amendment. Before the chair has put the question, however, the mover may withdraw it without the consent of the assembly.

The question on the adoption of a motion or resolution is usually known as the main question, and during the consideration of it the introduction of any other question is not permissible, but it is allowable to make subsidiary motions that may aid in disposing of the main question, or such as arise incidentally in the course of the consideration of the main question, or such as relate to the rules of procedure, the privileges of members, or the termination of the meeting. Among the subsidiary motions for disposing of the main question, all of which must be decided before the main question can be acted upon, are: first in precedence, the motion to lay on the table. The purpose of this motion is to postpone further consideration of the question until some future time, when it may again be taken up, which would not be allowable had the question been disposed of by a motion to postpone either definitely or indefinitely. This is a common method of suppressing a question, and is successful whenever a majority cannot be found to take it from the table during the session. A motion to lay on the table is not open to debate, cannot be amended, nor can another subsidiary motion be applied to it. The effect of the motion is usually to place on the table everything pertaining to the subject; thus, if an amendment be ordered to lie on the table the subject which it is proposed to amend is also laid on the table. A second means of disposing of the main question by means of a subsidiary motion is the demand for the previous question. This takes

precedence of every debatable question, but is itself open to neither debate nor amendment. It applies to questions of privilege as well as to any other debatable question. Its effect is to stop immediately all debate and bring the assembly to a vote on the question pending. When a demand is made for the previous question and seconded, the presiding officer immediately puts the question, "Shall the main question now be put?" If the question is lost the discussion continues as if the motion had not been made. The previous question requires a two-thirds vote for its adoption, may be demanded on a pending amendment, and if carried, debate on the amendment only is closed, the main question being still open to debate and amendment. It may also be used on an amendment to an amendment. (See PREVIOUS QUESTION.) A third method of disposing of the main question is by means of the motion to postpone to a certain day. Debate on this motion is limited and must not go into the merits of the subject matter any further than may be necessary to enable the assembly to judge of the propriety of the postponement. The effect of this motion is to postpone further consideration of the subject until a certain time, during which period it cannot be taken up except by a two-thirds vote. When that time arrives the question is entitled to be taken up in preference to everything except privileged questions. In the fourth place, the main question may be disposed of by a motion to commit or recommit. The purpose of this motion is to refer the subject to a committee. If different committees are proposed they should be voted on in the following order: (1) committee of the whole; (2) a standing committee; (3) a special committee. The committee, if a select one, may be appointed by the chair or nominated by a member or members and elected by the assembly. The motion to commit is debatable and the merits of the question may be gone into. In the next place, the main question may be disposed of by a motion to amend, which may take either of the following forms: (1) to add or insert certain words or sentences; (2) to strike out; (3) to strike out certain words and insert others; (4) to substitute; and (5) to divide the question. A paragraph once inserted cannot be struck out or amended except by adding to it. Similarly, words inserted cannot be struck out except by a motion to strike out the paragraph or a portion thereof. Certain motions are never open to amendment; among these are the motions to adjourn, to lay on the table, to postpone indefinitely, to reconsider, an amendment of an amendment, a demand for the previous question, for the orders of the day, and all incidental questions. An amendment may itself be amended, but not so as to alter its form. While an amendment is pending it is not in order to make another motion to amend until the first amendment is disposed of. Lastly, the main question may be disposed of by a motion to postpone indefinitely. This motion opens to debate the whole question which it is proposed to amend, but, as already observed, it cannot itself be amended. Its effect is to withdraw the question from the further consideration of the assembly for the remainder of the session. The previous question applies to this motion without affecting the main question.

What are called incidental questions are those which often arise in the course of the considera-

tion of the main question and consequently take precedence of the questions out of which they arise. Such questions are unamendable and, with a single exception, are undebatable. The incidental questions are those of appeal, objection to the consideration of a question, the reading of papers, leave to withdraw a motion, and suspension of the rules. The appeal arises out of objection raised to a decision of the chair on a question of order. The decision of the presiding officer is made without debate, and if a member objects to the result of the decision he may say, "I appeal from the decision of the chair." If the appeal is seconded the chairman puts the question as follows: "Shall the decision of the chair stand as the judgment of the assembly?" If there is a tie vote the decision of the chair is sustained. The appeal is the only incidental question which is open to debate, and there are a few cases when it cannot be debated. When debatable no member is allowed to speak more than once. If the presiding officer neglects to enforce the rules of procedure, any member may call his attention to the breach of order by rising and saying, "Mr. Chairman, I rise to a point of order," whereupon the chairman will request the member to state his objection, which he does and then resumes his seat. If the chairman decides that the point of order is not well taken, and no appeal is made against the decision, the first member is permitted to resume his speech. If the decision sustains the point of order, and objection is made, he cannot continue without a vote of the assembly. It is in order for any member to object to the consideration of the main question before debate has begun on it. The objection does not require a second, and may be made while another member has the floor. It cannot be debated, amended, or have any other subsidiary motion applied to it. Whenever objection is raised to the consideration of a motion the chairman states the question, "Shall the question be considered?" Unless an affirmative vote of a two-thirds majority is secured, further consideration for the remainder of the session is ended, otherwise the discussion continues as though objection had never been raised. The purpose of this motion is not to cut off debate, but to avoid the discussion of any question which may seem irrelevant or inexpedient. Any member has the right to ask for the reading of papers for the information of the assembly, but if an objection is raised the decision is rendered by the chair subject to appeal to the assembly. It is in order for the mover of a question which is before the assembly to withdraw it or substitute another in its place, if no one objects. If objection is made it is necessary to obtain leave to withdraw or substitute, which may be done by motion. Such a motion is neither debatable nor amendable. A motion to suspend the rules is one of the important incidental motions. Like the others of its kind, it cannot be debated or amended. It cannot be renewed at the same meeting for the same purpose, nor is it allowable except for a definite purpose, and then only by a two-thirds vote.

Another class of motions are those which are commonly known as privileged questions. They take precedence of all other questions, and are not open to debate except when they relate to the rights of the assembly or of its members. Privileged questions include motions to fix a time for adjournment, to adjourn, motions relative to rights and privileges of the assembly or

of its members, and the call for the orders of the day. The motion to fix a day for adjournment takes precedence of all other privileged motions, and is in order even after the assembly has voted to adjourn, provided the chairman has not announced the result of the vote. Next in precedence is the motion to adjourn. This motion is neither debatable, amendable, nor open to reconsideration after a vote has been taken. If the adjournment does not close the session, all unfinished business has precedence over new business at the next meeting and is treated as if there had been no adjournment. If the adjournment closes the session, and the next session is that of a new assembly, an end is put to all business unfinished at the close of the session, and it can be brought before the assembly only by being reintroduced. Questions of privilege are decided by the presiding officer, subject to the right of any two members to appeal from the decision. The assignment of one or more subjects to a particular day constitutes the orders of the day, and they are not open to consideration before that time except by a two-thirds vote. The orders of the day are classified as special and general, the former always taking precedence of the latter. A special order involves suspension of all rules that interfere with its consideration at the time specified, and it therefore requires a two-thirds vote to make any question a special order. The effect of an affirmative vote is to withdraw the question then under consideration as though an adjournment had happened. It is in order at any time, even though the floor is already occupied, to move a reconsideration of a previous vote on any measure, unless another question is before the assembly at the time. Unless the vote is by ballot the motion to reconsider must be made by a member of the prevailing side, and only on the day the vote was taken which it is proposed to consider. No question can be twice reconsidered, and a motion to reconsider cannot be amended, although it is debatable, and when debated it opens up for discussion the entire subject to be reconsidered. If the motion to reconsider is carried, the original question is in the condition it was in before the first vote was taken, and must be disposed of as if it had never been voted on. No one can debate the question reconsidered who had previously exhausted his right of debate on the question, although it is allowable to discuss it while the motion to reconsider is before the assembly.

The preliminary work of deliberative bodies is usually prepared by means of committees. These may be standing committees appointed for a definite time, select committees appointed for a special purpose, and committees of the whole consisting of the entire assembly. The first person named on a committee is usually the chairman, whose duty it is to call the committee together. A committee may facilitate its labors by the appointment of a subcommittee of its own membership. A committee report is usually made by the chairman, is signed by the members and delivered to the clerk. In case of disagreement among the members there may be a majority and a minority report. The report of the majority is the report of the committee, and it may be adopted by the assembly, rejected, or recommitted. After the report has been adopted the question is open to amendment as if there had been no committee report. An assembly may go into committee of the whole for the con-

sideration of a subject which it does not wish to refer to a committee but which it is desired to consider with the freedom and informality which characterize the procedure of committees. When this is done the presiding officer calls another member to the chair and takes his place as a member of the committee. During the consideration by committee of the whole no motions are in order except to amend and adopt or that the committee rise and report. Debate may be without limit unless the assembly votes that debate in committee shall cease at a certain time, and until then any member may speak as often as he can get the floor if no one else who has not had an opportunity to speak on the question claims it. When the debate is concluded a motion is made that the committee rise and report. This motion is always in order and is undebatable. When it is adopted the presiding officer of the assembly resumes the chair, while the chairman of the committee, having resumed his place in the assembly, reports to the chair the decision of the committee. Like other committees, the committee of the whole has no power to alter the text of any resolution referred to it. It is the practice of many deliberative assemblies to consider certain questions informally without going into committee of the whole, a procedure which is not very different from that of committee of the whole. This is the practice of the United States Senate in the consideration of measures on their second reading.

Debate upon a motion begins after it has been stated by the chairman and is closed by the chairman rising to put the question. If the presiding officer thinks the debate has ended, he inquires if the assembly is ready for the question, and if no one claims the floor he puts the question to a vote. The rule of the United States House of Representatives requires that those favoring the motion shall indicate their preference by saying Aye, and those opposing it say No. If when the presiding officer announces the result any member rises and expresses doubt as to the correctness of the result, or calls for a division, the presiding officer requests those who favor the motion to rise. After counting these and announcing the result, those opposed are requested to rise. These are counted and the final result is then declared. Or he may appoint tellers to make the count and report to him. Whenever there is a tie vote the motion is lost unless the presiding officer gives his vote for the affirmative. If his vote will cause a tie he may cast it and thus defeat the measure. Still another form of ascertaining the wish of members is the ballot. The following motions require a two-thirds vote for their adoption: amendment or suspension of the rules, making of special orders, objections to the consideration of a question, the demand for the previous question, and the closing or limiting of debate.

Consult: T. B. Reed, *Reed's Rules: A Manual of General Parliamentary Law* (Chicago, 1898); F. W. Hackett, *The Gavel and the Mace* (New York, 1900); H. M. Robert, *Rules of Order* (Chicago, 1901), the most convenient and in some respects the most authoritative manual of parliamentary law; E. A. Stevens, *American Law of Assemblies* (Minneapolis, 1901); Cushing and Bolles, *Manual of Parliamentary Practice* (Philadelphia, 1914). See AMENDMENT.

PARLIAMENT OF FOWLS, THE, or THE ASSEMBLY OF FOWLS. One of Chaucer's minor

poems, written in his favorite form of a vision. The poem is taken partly from Boccaccio's *Teseide* and alludes to other Italian sources, but is based mainly on Macrobius' *Commentary on Scipio's Dream*, a favorite book in the Middle Ages.

PARLOA, pär-lô'ä, MARIA (1843-1909). An American domestic economist, born in Massachusetts. She appeared in Boston as a lecturer on cooking in 1877, was special instructor, or lecturer, at various seminaries in Massachusetts and New Hampshire, and gave courses of lessons in sick-room cookery to Harvard medical students. In 1878 she visited Paris for study, in 1881 lectured in western cities, and in 1882 opened a cooking school in New York City. Her publications include: *Miss Parloa's New Cook Book and Marketing Guide* (1882; rev. ed., 1908); *The Young Housekeeper* (1894); *Home Economics* (1898; new ed., 1906); and other books of a similar nature.

PARLOW, pär'lô, KATHLEEN (1890-). A British violinist, born at Calgary, Alberta, Canada. When she was five years of age her parents removed to San Francisco, where she received her first musical instruction from Holmes, an English violinist, and a pupil of Spohr. Her progress was so rapid that in 1905 Holmes took her to London and exhibited her as a prodigy. She soon tired of such exhibitions, and her love for music was all but extinct when she heard Elman (q.v.). His playing revealed to her what true art was, and she at once proceeded to St. Petersburg to study with Elman's teacher, Leopold Auer (q.v.). After 18 months of hard work she made her début as a real artist in the Russian capital (1908). Her overwhelming success there was repeated upon her first tour of the United States in 1910, and subsequent visits confirmed the first impression. In spite of her youth she gained recognition as one of the masters of her instrument.

PARMA, pär'mä. Before 1860 a duchy in northern Italy, lying between Sardinia, Lombardy, Modena, and Tuscany. The city of Parma was one of the colonies established along the Æmilian Road by the Romans after the conquest of Cisalpine Gaul in 222 B.C. It was included in the Ostrogothic, Lombard, and Frankish kingdoms, and ultimately in the new German Roman Empire. In the eleventh century it was an appanage of Tuscany, and as such passed to the Countess Matilda. Lucchino Visconti, ruler of Milan, bought it from Obizzo d'Este about 1346. It passed, together with Milan, to the Sforza, and in 1499 was included in the conquests of Louis XII of France. In 1515, when Francis I reconquered Milan, he reannexed to it Parma and Piacenza, with the papal consent; but in 1521 it was retaken by the papal and Imperial troops. In 1545 Pope Paul III, one of the Roman house of Farnese, separated Parma and Piacenza from the papal domains and erected them into duchies for his natural son, Pietro Luigi Farnese, whose son, Ottavio, married Margaret, natural daughter of the Emperor Charles V. Pietro Luigi was assassinated in two years, and Parma and Piacenza were seized for the Emperor. Thereupon Paul III retracted his grant and resumed the papal claim. His successor, Julius III, who owed his election to the Farnese support, restored Parma to Ottavio Farnese. The Emperor retained Piacenza, and in 1551 sought to take

Parma, whereupon Ottavio sought the protection of France. Philip II, to secure his alliance against France in 1556, when Italy was menaced by a new French invasion, restored to him Piacenza, though a Spanish garrison remained there. Alessandro Farnese, son of Ottavio, entered the Spanish service and rose high in Philip's favor, and in 1585 the Spanish troops were withdrawn. Elizabeth Farnese, Queen of Philip V of Spain, in 1725 secured the reversion of Parma and Piacenza to her son, Don Carlos, who received them upon the death of the reigning Duke, Antonio, without issue, in 1731. Carlos exchanged them in 1735 with Austria for the Two Sicilies. In 1748 Parma and Piacenza, together with Guastalla, were handed over by Austria to the Spanish Bourbons in the person of the Infante Don Philip, with a reversion to Austria in case of failure to him of male descendants, or in case any of his descendants should ascend the Spanish or the Neapolitan throne. In 1801 Bonaparte concluded the Treaty of Madrid with Spain, by the terms of which Parma, Piacenza, and Guastalla were to be given to France on the death of Ferdinand, in exchange for which Don Luis, the son of Ferdinand, was made King of Etruria. France came into possession by the death of Ferdinand in the following year. The Treaty of Paris (1814) gave Parma, Piacenza, and Guastalla as a duchy to Maria Louisa, Napoleon's wife, and this was carried out, notwithstanding the protest of the King of Spain in behalf of the widow of the King of Etruria. On the death of Maria Louisa in 1847 the duchy reverted to Charles, Duke of Lucca, son of the King of Etruria, who succeeded as Charles II. Guastalla was given to Modena, and some small districts were added to Parma. The rule of Charles was tyrannical and illiberal. On the outbreak of the revolution in 1848 he was forced to grant the popular demands, but he soon afterward left the country. Parma joined Sardinia against Austria and was involved in the defeat of its ally. In March, 1849, Austria imposed upon Parma the rule of Charles III, son of Charles II, who had abdicated. The arbitrary rule of Charles III was closed by his assassination in 1854, when his widow, Louis Marie Thérèse de Bourbon, assumed the government in behalf of her son, Robert I. She made some attempt at reform, but left the country with her son on the outbreak of the War of 1859. On March 18, 1860, Parma was annexed to Sardinia and became a part of the new Kingdom of Italy by the will of its people. It now forms the two provinces of Parma and Piacenza.

PARMA. The capital of the Province of Parma, Italy, situated on both sides of the river Parma, 12 miles south of the Po and 75 miles southeast of Milan (Map: Italy, C 2). The town is circular in form and is surrounded by walls and ditches flanked by bastions. The site of the former fortifications is now nearly a complete circle of promenades. The streets are straight and wide and meet at right angles. The Roman Via Æmilia, here called the Corso Vittorio Emanuele, crosses the city from east to west, dividing it into two nearly equal parts. It traverses the Piazza Grande, where the official palaces and the statues of Correggio (1870) and Garibaldi (1893) stand. The northwest corner of the town is laid out in a fine public park. Here is situated the Palazzo del Giardino (1564), now a military school, con-

structed by the Farnese and containing frescoes by Carracci. Along the opposite side of the city extends the Stradone promenade.

Parma has over 60 churches, many of which are notable. The cruciform cathedral (erected 1064-74 and consecrated 1106) is built in the Lombard-Romanesque style. In the octagonal cupola is Correggio's "Assumption." Southwest of the cathedral is the baptistery (1196-1270), a splendid edifice of red and gray Verona marble. It is surmounted by several turrets, and the exterior is richly ornamented with symbolic tablets. In the interior is a series of good reliefs. The Madonna della Steccata (1521-39), the finest Renaissance church of Parma, is built in the form of a Greek cross and contains mural paintings by Parmigiano. The San Giovanni Evangelista (1510) is a fine Renaissance creation of eminent architects. The dome has noteworthy frescoes by Correggio, who has also here a valued "St. John the Evangelist."

The large but incomplete Palazzo della Pilotta (chiefly sixteenth and seventeenth centuries) owes its origin to the Farnese. In it are Parma's valuable art collections. In the museum of antiquities here are meritorious bronze statuettes. Its picture gallery contains good paintings by Giulio Romano, Canova's statue of Marie Louise, Holbein the Younger's "Erasmus," paintings and drawings by Parmigiano, and also famous examples of Correggio. Of these last the "Madonna della Scodella" is the most prominent. Other excellent works by Correggio are a "Descent from the Cross," a "Martyrdom of Sts. Placidus and Flacia," and the "Madonna di San Girolamo." The public library (Palatina) in the same edifice contains over 313,000 volumes and about 52,000 manuscripts, some of the latter of great interest and value. The Teatro Farnese, a wooden structure, is also here, dating from 1618 and latterly restored. In the convent of San Paolo, now used for a school, are found masterful frescoes by Correggio. The University of Parma was founded in 1512. There are faculties of jurisprudence, mathematics and science, and medicine and surgery. In 1912 the students numbered 406. Its paleontological collection and its African fauna from the Italian colonies are noteworthy. Connected with the university are a botanic garden, an observatory, and a pharmaceutical school. Among the other educational institutions of Parma are an Episcopal seminary, a lyceum, an agricultural institute, an academy of fine arts, and a school of music. The city is notable in art history as the place of residence of Correggio and the birthplace of Parmigiano.

Parma has manufactures of musical instruments, silks, woollens, linens, felt hats, leather, glass, and ironware. There is also a royal tobacco factory. The printing establishment founded by Bodoni in 1766 is famous in Italy. The trade is chiefly in wine, grain, cattle, and cheese. In June is held a silk fair. Pop. (commune), 1901, 49,340; 1911, 51,910; 1914 (est.), 53,781. Consult Irene Affò, *Storia della città di Parma* (9 vols., Parma, 1792-1859), and E. H. and E. W. Blashfield, *Italian Cities* (New York, 1912).

PARMA, JEAN JACQUES RÉGIS CAMBACÉRÈS, DUKE OF. See CAMBACÉRÈS.

PARMA, MARGARET OF. See MARGARET OF PARMA.

PARMENIDES (Lat., from Gk. Παρμενίδης).

A Greek philosopher of the fifth century B.C. and the most famous member of the Eleatic school (q.v.). Little is known of his life, but he was greatly revered in antiquity for his intellectual powers and noble character. He is said, when 65 years old, to have visited Athens, where Socrates, then a young man, heard him. Like his master Xenophanes, Parmenides set forth his philosophical doctrine in verse, his work being entitled "On Nature" (Περὶ Φύσεως). Considerable fragments of it are still extant. The leading design of this poem is to demonstrate the reality of actual being, the nonexistence of which Parmenides declares to be inconceivable, but the nature of which, on the other hand, he admits to be equally inconceivable, inasmuch as it is dissociated from every limitation under which man thinks. As for the phenomena of nature, they are only apparent and due to man's error; they only seem to exist, but have no real existence. Apparently Parmenides made no attempt to grapple with the inevitable contradiction between the doctrine of being and that of seeming. The fragments are published by Karsten, *Philosophorum Græcorum Veterum Reliquiæ*, vol. i (Amsterdam, 1835); Stein, in *Symbola Philologorum Bonnensium* (Bonn, 1867); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913); Diels, *Parmenides' Lehrgedicht, griechisch und deutsch* (Berlin, 1897). Consult: Zeller, *Philosophie der Griechen*, vol. i (5th ed., Leipzig, 1892); Theodor Gomperz, *Greek Thinkers*, vol. i, English translation by L. Magnus (New York, 1905); H. Dills, *Die Fragmente der Vorsokratiker* (2d ed., Berlin, 1906); R. B. English, "Parmenides' Indebtedness to the Pythagoreans," in *Transactions of the American Philological Association*, vol. xliii (Boston, 1912); John Burnet, *Greek Philosophy: Part i, Thales to Plato*, vol. i (London, 1914).

PARMENION (Lat., from Gk. Παρμενίων) (c.399-329 B.C.). A Macedonian general, who served under Philip and Alexander the Great. In 356 he defeated the Illyrians, in 342 carried out a successful campaign in Eubœa, and in 337 was sent into Asia Minor to pave the way for the conquest of Persia. While he was there Philip was assassinated. Parmenion, his most trusted servant, remained faithful to Alexander and acted as his military adviser and was commander of the left wing at the battles of Granicus, Issus, and Gaugamela. In 330, when Parmenion was in Media guarding the booty, his son, Philotas, was accused of treason against Alexander and was executed, after having implicated his father. Alexander may have believed the charge or feared vengeance from Parmenion; at any rate he had him put to death.

PARMIGIANO, pär'mè-jä'nò, or **PARMIGIANINO**, pär'mè-jä-nè'nò, ANTONIO MAZZOLA (1503-40). An Italian painter named from his birthplace, Parma. He early came under the influence of Correggio and became a successful imitator of his style. In 1523 he went to Rome, where his first manner underwent great modification, through his study of the masterpieces of Michelangelo and Raphael. His Roman career was interrupted by the sack of the city in 1527 by the soldiers of Charles V. The picture of St. Jerome, National Gallery, London, was painted at this time. After his return to Parma in 1531 misfortunes overtook him, and the end of his life was spent in poverty.

He was the last of the real Renaissance painters in north Italy. Though spoiled by mannerisms, his decorative paintings show grace and refinement and his portraits considerable vigor. Good examples of the latter are at Naples, Vienna, Madrid, and Hampton Court. Parmigiano's principal altarpiece is "Santa Margherita," in the Academy at Bologna. His most popular production is probably "Cupid Making a Bow" (1536, Vienna), frequently attributed to Correggio. Consult Affò, *Vita del Mazzola* (Parma, 1784).

PARNAHYBA, pär'ná-ē'bá. A river of northeast Brazil. It rises in the Serra das Mangabeiras on the north boundary of the State of Goyaz, flows northeast for 800 miles between the states of Piauí and Maranhão, and empties into the Atlantic Ocean at the town of Parnahyba (Map: Brazil, J 4). It is navigable for small steamers through the larger part of its course.

PARNAHYBA. A town in the State of Piauí, northeast Brazil, near the mouth of the river of the same name (Map: Brazil, J 4). It is the commercial centre of the Piauí, carrying on an active trade in agricultural and cattle products. Pop. (est.), 12,000.

PARNASSIENS, Lēs, lä pär'ná'syän'. A school of French poets, so named because they contributed to a lyric anthology known as *Le Parnasse Contemporain*. One of the first Parnassiens to come forward was Théodore de Banville (1823-91), but the real founder of the school was Théophile Gautier (1811-72), who formulated the doctrine of art for art's sake. Gautier's unhappy friend Baudelaire (1821-67) upheld this poetic dogma, but he died rather too early to belong to the Parnassian school, save by his tendencies. Under the leadership of Leconte de Lisle (q.v.), in whose house they gathered on Saturdays as early as 1856, a score of writers composed poems wherein they endeavored to suppress personal feeling, to avoid preaching, and to cultivate art for art's sake. Leconte de Lisle himself was called the impassive, but in him, as in others, one often feels an emotional lyric undertone, and this bursts forth in a truly lyric cry in "Les Monstreux," a poem in which Leconte de Lisle utters his beliefs with a great lack of his habitual Olympic impassivity. The Parnassiens aimed at great finish in thought and form, and many of them achieved their aim. Xavier de Ricard, Anatole France, Catulle Mendès, Armand Silvestre, François Coppée, Sully Prudhomme, Léon Dierx, and José María de Heredia, to name the most distinguished Parnassiens, undertook also to rid French poetry of a false sentimentality, borrowed, they thought, from the Lake school (q.v.), and to combat the imitation of Lamartine.

PARNASSUS (Lat., from Gk. Πάρνασσός). A chain of mountains in Phocis, Greece. It has twin peaks, now called Gerantorachos and Lykeri (8070 feet), which rise from the rough surrounding plateau and form a conspicuous landmark in eastern Greece (Map: Greece, Ancient, C 2). During all but the summer months the summits are covered with snow. The Greeks called these twin peaks the Phædiades; of these peaks alone the Roman poets speak. From the plateau rise other lesser peaks, and on the side of a hill at the south above Delphi is the Corycian Cave, dedicated to Pan and the Muses. On the slope of Parnassus was the foun-

tain Castalia (q.v.), whose waters were supposed to fill the minds of those who drank of them with poetic inspiration. The *Thyiades* are said by Pausanias to have celebrated the orgies of Dionysus on the highest summits. On the southern slope lay Delphi (q.v.), the seat of the famous oracle of Apollo. Consult K. Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909).

PARNASSUS. A borough in Westmoreland Co., Pa., 17 miles northwest of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, B 6). It contains a general hospital. Farming, lumbering, and some coal mining are carried on. Among the industries are manufactories of white lead, linseed oil, and car equipment. Pop., 1900, 1791; 1910, 2578.

PARNELL, CHARLES STEWART (1846-91). An Irish statesman and parliamentary leader. He was born at Avondale, County Wicklow, Ireland, June 27, 1846, of an old Protestant family. He was the son of John Henry Parnell, of English descent, and Delia Tudor Stewart, daughter of Rear Admiral Charles Stewart, of the United States navy. Parnell was educated at Magdalen College, Cambridge, but returned to Avondale without a degree. After traveling in the United States (1872-73) he became high sheriff of his county, and in 1875 he entered Parliament for Meath County. From the outset he displayed remarkable ability for leadership in politics and for parliamentary warfare. Reserved and dignified, with few of the ordinary graces of an orator, Parnell contrasted strikingly with the enthusiastic impulsive Irish debater of the type of O'Connell. But the very absence of these Irish qualities impressed upon the English the fact that now for the first time they had to reckon with a strong, well-directed Irish opposition.

In 1877, in conjunction with Biggar, Parnell brought together the hitherto disunited forces of opposition in a compact party of Nationalists, whose object was Home Rule for Ireland in all local affairs, including necessarily the restoration of the Irish Parliament. (See *HOME RULE*.) The method of political warfare followed by Parnell was bold and effective. He adopted extreme tactics of obstruction: to delay all public business as far as possible; to make combinations with any party that might be in opposition in order to embarrass the government; to use the balance of power in such a way as to secure concessions as the price of votes; and, in a word, to make all legislation extremely difficult until the demands of Ireland should be considered and accepted. For the support of this policy Parnell looked to the Fenians of Ireland and of America and to the Land League, which he helped organize in 1879 and of which he was the first president. The object of the league was not only to secure fair rents and to transfer the ownership of the soil to the tenants, but also to bring about Home Rule, by constitutional methods so far as practicable by force when necessary. (See *LAND LEAGUE*.) Meantime Parnell carried out his parliamentary warfare with singular tenacity and persistence, against the bitter opposition of both of the great English parties. The conservative traditions of the House of Commons were speedily set at naught: its rules were ingeniously perverted to defeat their own objects; every important piece of legislation was attacked, delayed, and in some cases defeated by the able combinations of the Irish party under

its great leader with some of the other elements of opposition. In 1877 and 1878 the Parnellites, as they began to be called, persistently opposed the bill for the annexation of the Transvaal, the flogging clauses of the Mutiny Act, and the Prisons Bill, and, joined by Joseph Chamberlain and leading Radicals, they carried the bill abolishing flogging in the army. Side by side with the development of this new policy the land agitation in Ireland grew and became a source of widespread public interest. To aid the movement and to relieve those tenants who suffered by eviction, Parnell in the winter of 1879-80 made a visit to America, where he raised large sums by popular subscription. On his return he was simultaneously elected to Parliament from Meath, Mayo, and the city of Cork, the last of which he chose to represent. His claim to lead his party was formally ratified when in May, 1880, the Irish members of Parliament chose him leader by a vote of 23 to 18. Supported by powerful social and political organizations and at last by the Catholic church, and controlling the words as well as the votes of his followers with a strong will and an iron hand, Parnell was now a formidable power in English politics. Continuing the land agitation, he was arrested and imprisoned in October, 1881, on the charge of intimidation and of obstructing the operation of the new Land Act. (See *IRISH LAND LAWS*.) He remained in Kilmainham jail until April, 1882, when he was released on parole.

At the general election of 1885 he was re-elected from Cork, and by a political bargain with the Conservative party secured the election of a number of Conservative candidates, though soon afterward he repudiated the agreement and threw his votes on the Liberal side (January, 1886), thus defeating the Conservative administration of Lord Salisbury. Gladstone, who by this change succeeded to office, was now definitely committed to the adoption of a measure of Home Rule for Ireland, and henceforth the Irish supported the Liberal party. On April 8, 1886, Gladstone had a bill introduced to give Home Rule, which ruptured the Liberal party and led to the formation of the Liberal Unionist party (see *LIBERAL UNIONISTS*), and Gladstone's administration was thereupon defeated and resigned in July, 1886. Nevertheless Parnell introduced a bill for the relief of tenants, which, as a whole, the Salisbury government refused to accept, though many of its important provisions were subsequently incorporated into the government's own measure. Towards the close of the session of 1887 a sensation was caused by the publication in the London *Times* of the facsimile of a letter purporting to have been written by Parnell to a friend, palliating the murder of the permanent Undersecretary for Ireland, Thomas Henry Burke, in Phoenix Park, Dublin, in 1882. On the night of the publication of this document Parnell returned to the House of Commons, from which he had been absent, and denounced the letter as a base and infamous forgery. But when Sir Charles Lewis, a Conservative, moved that the publisher of the *Times* should be prosecuted for libel at the expense of the government, the Irish members declined on the ground that they had no confidence either in the government or in English juries. Some time afterward this letter and others of a similar nature were found on investigation by a judicial commission (the Parnell Commis-

sion) to be the forgeries of a man named Richard Pigott, who after the exposure fled from the country and died at Madrid by his own hand. Parnell brought suit for libel against the *Times* and recovered £5000 damages. He was now at the very height of his prestige, but his downfall was near at hand.

For a long time rumors had been current in political circles connecting the name of Parnell with that of the wife of Capt. W. H. O'Shea, formerly member of Parliament for Galway and long an enthusiastic follower of Parnell. These rumors were confirmed when in 1889 Captain O'Shea applied for a divorce from his wife on the ground of adultery with Parnell. The case was tried in November, 1890, and, as no defense was made, the divorce was granted and Parnell was condemned in costs. This decision proved fatal to his reputation and political power. His offer to resign the leadership of the Irish party was at first declined, but soon it became known that Gladstone had written to John Morley that the continuance of Parnell's leadership would be disastrous in the highest degree to the cause of Ireland, implying that Parnell could no longer have the support and coöperation of the English Liberals. After this letter had been made public it was supposed that Parnell would renew his offer to resign. As he resolutely refused to give up the leadership, he was deposed by a vote of his parliamentary colleagues. The result was a division of the Irish party into Parnellites and Anti-Parnellites. The fallen leader now bitterly denounced both Gladstone and his own late colleagues who had turned against him. His appeal to the people, however, was answered by the defeat of three parliamentary candidates whom he had nominated. Nevertheless he struggled with desperate energy to recover his leadership till his health broke down completely in September, 1891. In July of that year he had married Mrs. O'Shea, and on the sixth of October following he died. See HOME RULE; IRELAND, *History*.

PARNELL, HENRY BROOKE, first BARON CONGLETON (1776-1842). A British politician born in Ireland. He studied at Eton and at Trinity College, Cambridge, and in 1797 entered politics as an anti-Unionist member of the Irish House of Commons. Two years after the Act of Union (1800) he was elected to the British Parliament for Queen's County, which, with an interval of four years (1802-06), he continued to represent until 1832, when he declined to stand again. The next year he was elected from Dundee, which he continued to represent from that time until his elevation to the House of Lords as Baron Congleton of Congleton in 1841. He became Secretary of War in Earl Grey's

Liberal cabinet in 1831, but was dismissed the next year for refusing to support the ministry on the Russo-Dutch War question. His chief interest was in financial and agrarian subjects, and in 1838 he strongly urged the abolition of the Corn Laws. He wrote a number of works, including: *Observations upon the State of Currency of Ireland* (1804; 3d ed., 1804); *An Historical Apology for the Irish Catholics* (1807); *A History of the Penal Laws against the Irish Catholics, from the Treaty of Limerick to the Union* (1808); *Treatise on the Corn Trade and Agriculture* (1809); *On Financial Reform* (1830; 4th ed., 1832); *A Treatise on Roads* (1833; 2d ed., 1838).

PARNELL, THOMAS (1679-1718). An Anglo-Irish poet, born in Dublin. He graduated at Trinity College, Dublin, and was ordained deacon, though under the canonical age. In 1706 he was appointed Archdeacon of Clogher, in 1713 prebendary to St. Patrick's Cathedral, Dublin, and in 1716 vicar of Finglas. He contributed to the *Spectator* and *Guardian* and was the associate of Swift, Pope, Arbuthnot, and Gay in the Scriblerus Club. On the fall of the Whig government, near the close of Anne's reign, he went over to the Tories and stood in high favor with the Oxford administration. But his prospects of advancement from that quarter were destroyed by the overthrow of the Tories on the death of the Queen. His disappointment at not obtaining better promotion, and the death of his wife (1711), threw him into deep melancholy, and he is said to have hastened his death by intemperance. He died at Chester in October, 1718. Besides the occasional papers written for Addison and his share in *Scriblerus*, Parnell helped Pope in the translation of the *Iliad*, and contributed to the first volume an *Essay on the Life, Writings, and Learning of Homer* (1715). His poems were collected by Pope in 1721. The volume contains 20 poems, among which are "The Hermit," "The Fairy Tale," "A Night Piece on Death," and "A Hymn to Contentment." In 1758 appeared the *Posthumous Works of Parnell*. The volume adds nothing to his fame. Consult the *Life of Parnell* by Goldsmith, and the edition of Parnell's poems by Aitken in the Aldine Series (London, 1804).

PARNY, pär'né', ÉVARISTE DESIRÉ DESFORGES, VISCOUNT DE (1753-1814). A French poet born in the Isle of Bourbon. In his childhood he went to Paris, became a soldier, and in 1773-75 he revisited his native land and there loved a Creole, whose praises he sang in the *Poésies érotiques* (1778). His later epics have less literary merit. They are frivolous and obscene. Of these *La guerre des dieux anciens et modernes* (1796) is characteristic. His *Works* were published at Paris in 1808 in five volumes. The latest edition of his *Poésies complètes* appeared in 1887.

PAROCHIAL SCHOOLS. This term is employed to designate those elementary schools which are maintained by certain denominations and are organized on the basis of parishes. (See PARISH SCHOOL.) These schools are the outcome of a desire to provide a system of education which does not neglect the religious aspects which are regarded by the denominations maintaining such schools as the true foundation of a good education. They are thus a protest against the complete secularization of the public schools. The only parochial school system in the United States that is making rapid progress

is that maintained by the Roman Catholic church, which claims that since its schools relieve the country of the financial burden of educating the children of its faith, their parents should at least be exempted from that part of their taxes which go to education. A similar protest is also made by the Lutheran church, and in 1911 the German Missions Synod attempted to secure legislation which would relieve Lutherans of the tax now paid for the maintenance of secular schools. These two denominations, the Roman Catholic and the Lutheran, present the chief examples in the United States of well-developed parochial school systems.

Roman Catholic Church. The Roman Catholic church has always asserted the right to educate the young, believing that intellectual, moral, and religious education form an inseparable whole and provide the only true basis for good citizenship. Accordingly education was regarded as one of the principal tasks of the church wherever a settlement of Catholics sprang up in America. Education always formed the subject of discussion at the plenary and provincial councils of the church throughout the nineteenth century. The most important of these in the development of parochial schools was the Third Plenary Council, held at Baltimore, in 1884. Here Catholic parents were urged and commanded to send their children to schools of their own faith to procure for them "a truly Christian and Catholic education and to defend and safeguard them from the dangers of an education merely secular during the entire period of childhood and youth." The council provided for the supervision of schools and the training and certification of teachers. Since that date the parochial system has shown remarkable progress and vigor, as is evidenced by the fact that, while in the first decade of this century the Catholic population showed an increase of 35 per cent, there was an increase of 40 per cent in the number of pupils in parochial schools. In 1900 there were 3812 parochial schools, 4972 in 1910, and 5256 in 1913, with an enrollment of 1,360,761 pupils. It is estimated that the cost of maintaining these schools is over \$11,000,000, raised by voluntary contributions. While the per capita charge is low, it must be noted that the great majority of the teachers are members of religious congregations. It is claimed for the church that it would cost the country to accommodate the pupils now attending parochial schools \$84,325,450, without the cost of maintenance.

The parochial schools are organized on a diocesan basis under the charge of the bishops. Assisting the bishops are either school boards of priests appointed by them or, according to an increasing practice, diocesan superintendents. The functions of the superintendents are very similar to those of superintendents of other school systems. They are responsible for the courses of studies, textbooks, school regulations, certification of teachers, inspection and examination of schools, and for presenting annual reports to their bishops or school boards. Where superintendents are not employed their functions are performed by the school boards; in other cases the school boards stand in an advisory and legislative capacity to their superintendents. The superintendents are assisted in their work by school visitors or examiners and by inspectors of communities, the latter being concerned with the teachers of their own order

or community. Each school is under the supervision of the parish priest, assisted by a board of laymen.

Apart from religious instruction the schools aim to give the same type of curriculum as is usually found in the public elementary schools. The teachers belong for the most part to teaching congregations and receive their training during their novitiates. For the improvement of teachers in service there are, in addition to the regular systems of supervision and inspection, summer schools conducted by the congregations, institutes, summer schools provided by colleges and universities, and in 1911 a teachers' college was established at the Catholic University of America for the higher education of women teachers.

In addition to the elementary schools the church is gradually developing a system of high schools. In 1911 it was reported that from 400 to 500 parochial schools were giving high-school work to older pupils; but this work was not organized and was largely an individual matter. Since 1911 a movement has been in progress to provide central high schools to serve the needs of several parishes. It is intended that such schools shall be independent of the parishes and under the direct control of the bishops as diocesan institutions. Another movement looking to the better organization of Catholic high schools is in the direction of securing their articulation and affiliation with standard colleges. Thus, since 1912 some 50 schools have in this way become affiliated with the Catholic University of Washington.

The general interest and progress of education in the church are promoted by the Catholic Educational Association, which was organized in 1903 and has several departments devoted to different branches of the work.

Lutheran Church. The history of parochial or congregational schools of the Lutheran church in this country has been continuous since the days of the first German settlers. While congregational schools flourished everywhere until the development of the public-school system, they are now to be found mainly in the North Central States. Their function is regarded as twofold: (1) to afford a religious basis for education and promote the faith, and (2) to transmit the language and culture of the countries of origin of the members. The schools are established and maintained by the individual congregations or by school societies within the congregations. While no compulsion is exercised, members of the congregations are expected to send their children to congregational schools by preference, and moral suasion is employed to this end and also to secure funds for the maintenance of the schools. While it is common to charge tuition, there is a movement to abolish this practice. The schools provide in general the same curriculum as the public schools, with the addition of religion and a foreign language (German, Norwegian, Swedish, etc., according to the nativity of the congregants). The majority of teachers are men, women sometimes being employed in the primary grades. Seven teachers' seminaries are maintained to train instructors. A large number of pastors, however, are also engaged in teaching, and all assist in the schools in a supervisory capacity. In 1913 the church had 5883 schools, attended by 272,914 pupils, or only 22.4 per cent of the child population of

the church. The slowness of progress of the Lutheran parochial schools is perhaps due to lack of funds for schools that will compare with the public schools and in no small degree also to the fact that the immigrants, on whom the schools rely, soon turn to the public schools. To remedy this a large number of supplementary schools are conducted, some on Saturdays, some several days in the week, to provide religious instruction to pupils attending the public schools. Besides the elementary schools a large number of academies, colleges, and theological seminaries are maintained by the denomination.

Consult: J. A. Burns, *The Catholic School System in the United States* (New York, 1908); P. J. McCormick, "Roman Catholic Parochial Schools," and W. H. T. Dall, "Progress and Condition of Lutheran Parochial Schools," in *United States Bureau of Education, Report of the Commissioner, 1913*, vol. i (Washington, 1914); *Why Lutheran Schools?* (St. Louis, 1912).

PARODY, pār'ô-dī (Lat. *parodia*, from Gk. *παρωδια*, *parody*, from *para*, *para*, beside, beyond + *ὄδῳ*, *ôdô*, song, ode, from *ἀείδω*, *acideîn*, *âdeu*, *adeîn*, to sing. A parody is something sung (set) beside, i.e., in imitation of, something else). As understood by the Greeks in early times, a parody was a comic imitation of a serious poem or of some part of it, but the term came to be applied also to the comic imitation of any variety of prose, such as history or fiction. Parody, like travesty, is a form of burlesque. The essence of burlesque is the treatment of a light theme in the style appropriate to a serious work. Such, e.g., is Chaucer's *Nun's Priest's Tale*, wherein the hubbub caused by Master Reynard in the widow's household is described in language suggestive of the fall of Troy. The humor lies in the contrast between subject matter and the treatment of it. In the travesty, such as the clever *L'Enéide travestie* of Paul Scarron (q.v.), the characters of the original are turned to a humorous account by some change in the incidents that results in a debasement of the original theme. In the parody the theme and the characters are greatly modified or completely changed, but the style of the original is closely followed in those peculiarities that easily lend themselves to ridicule.

Though the word "parody" has come to us from the Greeks, it is not to be supposed that they were the first people to feel the impulse towards this kind of satire. Parody belongs to the folk literature of many races, perhaps of all races. In very early literary stages writers have laid hold of contemporary legal and religious phrases for giving a humorous turn to the common affairs of life. All that can be said is that the parody as a distinct literary type of satire has been handed down from the Greeks, giving form to the folk parodies of the Western nations. Contemporary with or hard upon the epic and dramatic poetry of Greece came the parodists of those two forms of art. The first Greek parodist, according to Aristotle, was Hegemon of Thasos (fifth century B.C.), who gained a prize at the Athenian games with his *Gigantomachia*, or *Battle of the Giants*. By others the invention of the form has been ascribed to Hipponax (q.v.) (sixth century B.C.). But these are doubtful traditions. At any rate, the best extant parody of the epic among the Greeks is *The Battle of*

the Frogs and the Mice, running closely on the lines of a Homeric combat. (See *BATRACHOMYOMACHIA*; *MARGITES*; *RHINTHON*.) The great master of parody was Aristophanes (q.v.), the great comic poet of Athens into whose comedies were taken over whole passages of Euripides and many current phrases for the purpose of ridicule. Aristophanes was followed first by the writers of the New Attic Comedy—Menander, Philemon, Diphilus, etc.—in whose writings parody abounds. A master of parody was Lucian (q.v.), who in *The Dialogues of the Gods* freely employed the language of Homer and in *The True History* built up an extravagant romance on incidents from the *Iliad* and contemporary tales of adventure. Parody is very common in Plautus (q.v.), whose comedies are based on those of the New Attic Comedy. That the Romans were fond of parody is known also from Cicero, who in his *De Oratore* enumerates its several kinds. Horace, in several passages of his *Sermones*, parodies the epic effectively. Catullus was a favorite with the parodist; and Vergil did not escape. The Roman *Metamorphoses* of Ovid (q.v.) is a prolonged burlesque of the epic myths.

Among the Romans are found the first parodies of the legal testament, or will. It was a custom as early as the time of Julius Caesar for men to satirize their enemies by scurrilous remarks about them in their wills. Out of the practice seems to have grown the humorous testament, in which some animal, a pig or an ass, bequeathes at death his property or qualities to posterity. These animal testaments, of which the earliest one extant goes back to the third century of our era, spread through the Latin races, appearing in French, Spanish, and Portuguese during the early Renaissance. A good example is the *Testamentum Porcelli* (*The Last Will and Testament of a Little Pig*), which can be found in Peck-Arrowsmith, *Roman Life in Latin Prose and Verse* (New York, 1894). Akin to them are the many imaginary testaments written on various occasions in later times. A fine specimen is *The Will* by John Donne, the Elizabethan poet. Closely related to the humorous testament is also the parody on the epitaph, which goes back to the Middle Ages. This kind of satire is seen in its perfection in the *Ballade des pendus* of François Villon, composed in anticipation of the gallows. Indeed, both the Lesser and the Greater Testament of Villon are parodies so excellent in their kind as to form a type. Almost equally famous is Goldsmith's *Retaliation* on the imagined death of his friends, including Burke, Garrick, and Reynolds.

For centuries the most fruitful source of parody was the Bible and the liturgy of the Christian Church. This was, of course, in line with the work of Lucian, though it was at first in no direct way connected with him. From the twelfth century onward, increasing greatly during the Reformation period, flourished parodies of the mass, the creed, the litany, the paternoster, and prayers and hymns to the Virgin. They were sometimes written in Latin and at other times in the vernacular speech. In *Cynthia's Revels* Ben Jonson introduces a light parody of the litany, and Lord Somers, who framed the Declaration of Rights, parodied the first four chapters of St. Matthew. In 1817 William Hone, a London author and bookseller, was prosecuted for publishing parodies on the

litany, the Athanasian Creed, and the catechism, which he had employed for political satire. These are but a few examples taken from a class numbering hundreds.

The purely literary parody, aiming at good-natured banter, though not unknown to the ancients, is mainly a modern development from the harsh invective of the earlier times. It has long been expected that a popular poet or novelist will have his peculiar style and way of viewing things held up to ridicule. So kindly is this ridicule that not even the most sensitive author can receive other than pleasurable emotions from it. Shakespeare amused his audiences with the rant of the contemporary drama and the cuphuism of John Lyly, and evidently was not hurt when friends like Beaumont and Fletcher paid him in his own coin. In more than one instance Shakespeare even parodied himself. A parody of the inferior and dead or moribund mediæval romances was Cervantes' *Don Quixote*, which was completely adopted into English literature. The bombast and nonsense of Dryden's tragedies received their just castigation in the Duke of Buckingham's *Rehearsal* (1672). Among the parodies of Milton the *Splendid Shilling* of John Philips (died 1708) is still reckoned the best. Passing by Gray, Goldsmith, and Cowper, each of whom had his parodist, we come to the nineteenth century, the age *par excellence* of parody. The first romantic group of English poets, including, among others, Wordsworth, Keats, and Shelley, were especially exposed to ridicule. Then came Tennyson and Browning with marked mannerisms, and finally the so-called Pre-Raphaelites, like Rossetti, William Morris, and Swinburne, with their florid imaginations, distorted female figures, and unreal landscapes. There could be no finer material for the parodist. In their *Rejected Addresses* (1812) Horace and James Smith burlesqued deliciously Wordsworth, Southey, Byron, and Scott. Following in the line of the Smiths are R. H. Barham's *Ingoldsby Legends* and the *Bon Gaultier Ballads*, the joint work of W. E. Aytoun and Theodore Martin. Among other clever verse parodists were Thomas Hood, W. M. Thackeray, C. S. Calverley, Lewis Carroll, Sir Frederick Pollock, J. K. Stephen, and the numerous contributors to *Punch*, who have closely watched for absurdities of sentiment and style. From this list should be selected Calverley as undoubtedly the most felicitous parodist in the whole range of English literature. Especially successful was he in imitating Tennyson's *The Brook* and Browning's *The Ring and the Book* in *The Wanderers* and *The Cook and the Bull*. And the eccentricities of the Pre-Raphaelites are finely exaggerated in the *Ballad*.

The English novel began its career with parody. Richardson had no sooner published *Pamela* than humorous continuations were placed upon the market. All of them are now forgotten except Fielding's *Joseph Andrews*, which begins with ridicule of Richardson's point of view and a close parody of his epistolary style. Sterne was likewise the sport of a score of humorists. Before publishing *Vanity Fair* Thackeray paid his compliments to Bulwer, Disraeli, Lever, and G. P. R. James, and afterward to Scott. The mine opened by Thackeray in these *Burlesques* was further worked by Bret Harte in two series of *Condensed Novels* dealing with the older novelists and Mrs. Humphry

Ward, Anthony Hope, Sir Arthur Conan Doyle, Hall Caine, and Kipling. In like manner Sir Owen Seaman in *Borrowed Plumes* (1902) burlesqued Mrs. Craigie, Miss Fowler, Marie Corelli, George Meredith, Maurice Hewlett, Henry James, and other novelists of the day. His deftness in this genre is exemplified also in *The Battle of the Bays* (1896). Barry Pain, too, may be remembered by his *Playthings and Parodies* (1892). Mention should also be made here of Max Beerbohm's *A Christmas Garland* (1913), composed of clever parodies of some 20 of his contemporaries, including George Meredith, Henry James, Rudyard Kipling, Arnold Bennett, Joseph Conrad, H. G. Wells, George Moore, and Bernard Shaw. These are genuine parodies, as contrasted with mere burlesques. In them the author not only catches the tricks of style of his victims, but would seem for the moment even to identify himself with their minds and points of view.

Parody has been considerably cultivated by American writers with at least fair success. Of Colonial parodists the most important is doubtless Joseph Green of Boston, the witty rival of Mather Byles, the punning parson. The Revolutionary satirists naturally made use of parody, a good illustration being John Witherspoon's parody of the *Petition* of Rivington, the Tory printer. After the Revolution the Hartford Wits essayed parody and the mock-heroic in *The Echo* and *The Anarchiad*. The absurdities of the Della Crusceans and the pretensions of the new Democratic-Republican party furnished materials to parodists and satirists, but the first elaborate parody of real consequence, Irving's *Knickerbocker's History of New York*, changed under its author's hands into a masterpiece of humorous narration. With the next generation came authors original enough to be parodied not only in America but in England; e.g., Willis, Longfellow, and Poe. It was even found worth while to parody, in a volume modeled on the *Rejected Addresses*, versifiers whose names are now scarcely remembered. The Civil War gave an impetus to the writing of parodies. Some clever ones are to be found in the works of professed humorists like D. R. Locke (Petroleum V. Nasby) and R. H. Newell (Orpheus C. Kerr), but the most important and sustained is Richard Grant White's *New Gospel of Peace*. Of recent years Walt Whitman is naturally the writer who has best lent himself to parody. Bret Harte (q.v.), mentioned in the preceding paragraph, and Bayard Taylor, in *The Echo Club and Other Literary Diversions*, are probably the most important writers of parody with regard to both quantity and quality. Carolyn Wells, an anthologist of parodies (see below), is also a writer of parodies of various English poets and notably of Fitzgerald's Omar Khayyam in *The Rubáiyât of Bridge* (1909).

Bibliography. For Greek: W. E. Hope, *The Language of Parody: A Study in the Diction of Aristophanes* (Baltimore, 1906); Christ-Schmid, *Geschichte der griechischen Litteratur* (5th ed., 2 vols., Munich, 1908-13; 6th ed., vol. i, part i, 1912). For the early history with its bibliography, J. O. Delepierre, *Essai sur la parodie* (London, 1871). A popular history of parody with examples from modern literature is given by A. S. Martin in *On Parody* (New York, 1896). For a larger collection, consult Walter Hamilton, *Parodies of the Works of English and American Authors* (London, 1884-89), and Caro-

lyn Wells (comp.), *A Parody Anthology* (New York, 1904). Some good specimens of recent verse parody may also be found in A. H. Miles, *The Poets and Poetry of the Nineteenth Century*, vol. ix (ib., 1907), in Jerrold and Leonard, *A Century of Parody and Imitation* (ib., 1913), and in other anthologies. See BURLIQUE; TRAVESTY.

PAROL, pá-ról' (Fr. *parole*, word, from Lat. *parabola*, parable). In English and American law, primarily something said or spoken as distinguished from something expressed or set forth in writing. It is in this natural sense of the term that it is used to distinguish oral or spoken from written evidence of a transaction or occurrence. See EVIDENCE, *Parol Evidence Rule*.

In the law of contracts, however, the term "parol" is used of any statement or term of an agreement, whether oral or written, which is not under seal and which therefore requires a consideration for its validity. The expression "parol contract" is accordingly equivalent to "simple contracts." See CONTRACT.

By statute or by the common law many acts and transactions are required to be in writing in order to have legal validity. Among these are wills, conveyances of land, legislative acts, or statutes, and certain classes of contracts. See FRAUDS, STATUTE OF.

PAROLE. In penal law, a pledge of good conduct given by a person convicted of crime as a condition of exemption or release from confinement in prison. The parole system, as it is called, has in recent years been established in most of the United States as an important feature of a widespread and comprehensive movement in penal reform. It is based on the principle that, as prison life affords little or no real opportunity for demonstrating the capacity of a convict to lead an honest and decent life in a state of freedom, and as the leading of such a life by an ex-convict is beset with many difficulties, it is desirable that the State should retain a certain control and exercise some supervision over him for a time after his release. Accordingly a person who has been sentenced to an indeterminate period of imprisonment, as is now the usual practice, may be released on parole before the maximum limit of his term has been reached, either on the expiration of the minimum term or of some other shorter term fixed by statute, on condition of good behavior. The release in such case is not an absolute discharge, such as he receives as a matter of right on the expiration of his full term, but is conditional on the due performance of his pledge. For a violation of his parole within the time limited he is liable to be apprehended and returned to prison to serve out his full or maximum term. During the parole period he is required to report from time to time to the prison authorities or to a parole agent or parole officer to whose custody he was committed when released.

In most States the power of releasing a prisoner on parole is vested in a board of parole, which acts in a judicial capacity, visiting the prisons or other penal institutions from which applications for release have been received, examining the applicants, inquiring into their prison records, and in general determining their fitness for parole. In practice most persons confined under the maximum-minimum sentence now generally imposed are released at the ex-

piration of the minimum term for which they were sentenced or other shorter term fixed by law, unless their conduct while in prison has been conspicuously bad or unless they have incurred the ill will of the prison officials. The tendency of recent legislation in the United States is to fix a short minimum term, especially for first offenders and for all but the most serious offenses.

There are no trustworthy statistics as to the effect of the parole system upon the life of the convict after his release, but it is generally believed that the conditional character of the discharge and the supervision, slight as it is, to which the paroled prisoner is subjected have a beneficial effect in many cases. The system is still in a crude and undeveloped state. With improved methods of supervision and a more sympathetic and helpful attitude on the part of the community to which the paroled convict is released, the parole system should prove an important agency in the rehabilitation of the convict population. See IMPRISONMENT; INDETERMINATE SENTENCE; PENOLOGY; PROBATION; PUNISHMENT.

PAROLE (Fr. *parole*, word, from Lat. *parabola*, comparison, speech, parable). In its military sense the word "parole" is used to designate two different things: 1. With reference to guards the parole is a word, usually the name of a general or other distinguished person, used as a check on the countersign, usually the name of a battle, in order to obtain more accurate identification of persons. The parole is important only to those who are entitled to inspect guards and to commanders of guards. The parole or countersign or both are sent sealed in the form of an order to those entitled to them. With reference to this kind of parole the 44th Art. of War, United States Army, states: "Any person belonging to the armies of the United States who makes known the watchword to any person not entitled to receive it, according to the rules and discipline of war, or presumes to give a parole or watchword different from that which he received, shall suffer death or such other punishment as a court-martial may direct." 2. In international law, the pledge of honor of a prisoner of war by which he engages, if given his freedom, to observe certain conditions imposed by his captor. The pledge usually required is not to serve again against the government holding him or against its allies during the war. The release of prisoners of war on parole came into vogue with the disappearance of the old right of the captor to hold such a prisoner indefinitely for ransom, but only in the case of officers and even then only under exceptional circumstances. With a view to encouraging the practice and checking its abuse The Hague Conference of 1899 enacted a convention (Articles x, xi, and xii) defining its conditions and regulating its exercise. These articles provide in substance that prisoners of war may be set at liberty on parole if the laws of their country authorize it; that prisoners so released are bound on their personal honor scrupulously to fulfill the conditions of the parole; that in such case the government of the released prisoner shall not require of nor accept from him any service incompatible with the parole given. If a government disapproves of the parole given, it becomes the duty of the paroled person to return himself to captivity. A paroled prisoner who is recaptured bearing arms against

the government to which he has pledged his honor or against its allies forfeits his right to be treated as a prisoner of war and may be brought before the military courts of his captor. It is also expressly provided that there is no obligation on a government to release a prisoner on parole nor on a prisoner to accept release on such terms as may be offered him.

The laws of most countries place no restriction on the right of its soldiers to secure release on parole, but in the American and British armies paroles can be given only through a commissioned officer except in cases of extreme hardship. In the nineteenth century prisoners were sometimes paroled within certain limits, such as a town, in order to lighten the burden of captivity.

Notwithstanding the burden which the custody of a large number of prisoners of war involves for the captor, release on parole is still rarely practiced. Obviously the pledge of a soldier not to engage again in hostilities against his country's enemy is not regarded as adequate security against his doing so, even though the breach of parole is, in case of recapture, usually punished with death.

Consult: J. B. Scott, *Texts of the Peace Conferences at The Hague, 1899 and 1907* (Boston, 1908); *Instructions for the Government of Armies of the United States in the Field*, section vii, "The Parole," in Scott (*supra*), appendix; A. P. Higgins, *The Hague Conferences and Other International Conferences* (New York, 1909); J. M. Spaight, *War Rights on Land* (London, 1911). See INTERNATIONAL LAW and references there given; PRISONERS OF WAR.

PAROL EVIDENCE. See EVIDENCE.

PARONYCHIA, pār'ô-nîk'i-â, or WHITLOW. An inflammation, generally superficial, beginning at the root of a nail and attended by pain and suppuration. See FELON; NAIL.

PAROQUET, pār'ô-kët. See PARAKEET.

PA'ROS (Lat., from Gk. Πάρως). An island of the Cyclades, in the Grecian Archipelago. It is situated west of Naxos, from which it is separated by a channel from 4 to 6 miles wide (Map: Greece, Ancient, D 3). The greatest length of the island, 15 miles; greatest breadth, 9 miles; area, about 95 square miles. Pop., 1907, 3586. The island is chiefly a mountain mass, rising in the centre, in the ancient Marpessa, now Mount St. Elias, to a height of nearly 2500 feet. In the valleys the vine and grain are cultivated, but the chief importance of the island in ancient times was due to the marble, and especially the highly esteemed lychnites, which was much sought by sculptors. Parikia, on the west coast, on the site of the ancient Paros, is the principal town. Ancient tradition attributed the early colonization of the island to Cretans, who called it Minoa; later it was settled by Ionians. It early enjoyed prosperity from its marble and its numerous sculptors. Later it submitted to Persia, and was unsuccessfully attacked by Miltiades after the battle of Marathon. After the Persian wars it joined the Delian League and shared the fortunes of the neighboring islands. Like others of the Cyclades it passed under the rule of the Ptolemies of Egypt, and in 197 B.C. was presented to the Athenians by Rome. Since then it can scarcely be said to have had a separate history. It was celebrated in literature as the native place of the poet Archilochus, and is known also from the discovery of the famous Parian Chronicle. See ARUNDEL MARBLES; CHRONICLE OF PAROS.

PAROTID GLAND. See SALIVARY GLAND.

PAROTITIS, pār'ô-tî'tis. See MUMPS.

PARQUETRY (Fr. *parqueterie*, from *parquet*, a finely joined floor, dim. of *parc*, park). Inlaid or mosaic flooring, formed of pieces of wood from ¼ inch to 1½ inches thick, fitted together in rectilinear patterns much larger in scale than the designs of marquetry (q.v.). Sometimes wainscots and walls are paneled in parquetry. The use of parquet flooring first became common in France in the period of Louis XIII. See INLAY; MOSAIC; TILE.

PARR (so called probably from the parr marks or crossbars on the sides). A young salmon before its first migration to the sea and when its sides still show indistinct bars. Cf. SMELT; see SALMON.

PARR, CATHARINE (1512-48). The sixth and last Queen of Henry VIII of England. She was the daughter of Sir Thomas Parr, of Kendal, Westmoreland. Married first to Lord Burgh and afterward to Lord Latimer, she was wedded, not without misgivings, to Henry VIII on July 12, 1543. She was distinguished for her learning and knowledge of religious subjects. Her influence was for good; she persuaded Henry to restore the right of succession to his daughters; wished to educate them and Prince Edward, and interested herself on behalf of the universities. In 1544, during the absence of Henry at the siege of Boulogne, she acted as Regent of the Kingdom. After Henry's death she married (1547) Sir Thomas Seymour, and died after childbirth the following year. Consult Agnes Strickland, *Lives of the Queens of England* (Philadelphia, 1902-03).

PARR, MRS. LOUISA (maiden name TAYLOR) (c.1848-1903). An English novelist, born in London. She passed her early life in Cornwall. Marrying a physician in 1869, she settled at Kensington. Before this she had written a story entitled *How it All Happened* (in *Good Words*, 1868). This graceful story, translated into French, appeared also in the *Journal des Débats*. Her first three-volume novel, *Dorothy Fow* (1871), was well received. But she first gained her audience with *Adam and Eve* (1880), which depicted with faithfulness the quaint fishing village of Polperro in Cornwall. Among subsequent novels are *Loyalty George* (1888); *The Squire* (1892); *Can This Be Love?* (1896).

PARR, SAMUEL (1747-1825). An English scholar, born at Harrow-on-the-Hill. He was sent to Emmanuel College, Cambridge, in 1765, but the death of his father two years afterward compelled him to withdraw and to accept an assistant mastership at Harrow, where he remained five years. In 1776 he was appointed master of Colchester School, where he was ordained priest and obtained the curacies of Hythe and Trinity Church. Next year he became master of Norwich School, but in 1786 settled at Hatton in Warwickshire, where he spent the rest of his life. In 1787 he published an edition of Bellenden, to which he prefixed his celebrated preface, which is as remarkable for its uncompromising advocacy of Whig principles as for the scrupulous Ciceronianism of its Latinity. Parr was a man of vast learning, but his scholarship was not of high order. Consult De Quincey's essay, *Dr. Samuel Parr on Whiggism in its Relations to Literature*.

PARR, THOMAS (c.1483-c.1635). An English centenarian, known as Old Parr. In 1635 he was brought by the Earl of Arundel to London

and presented at court as then 152 years of age. He was exhibited in London, where he excited both scientific and popular curiosity. He died the same year on November 15, and the following day Dr. William Harvey, discoverer of the circulation of the blood, made an autopsy, found the body in singularly good condition, and attributed Parr's death to the London climate and the change from a simple to a rich diet. Parr was long a favorite chapbook character, but assertions of his extreme age have been investigated and doubted by W. J. Thoms and Sir G. C. Lewis. The value of the latter's opinion is somewhat impaired by his expressed disbelief in the existence of properly proved cases of centenarians, many of which are on record. The chief source of information concerning Parr is a curious pamphlet by John Taylor, entitled *The Olde, Olde, very Olde Man* (1635). Consult "Sir G. C. Lewis and Longevity," in *The Fortnightly Review* (London, April, 1869).

PARRAKEET (Fr. *perroquet*, from Sp. *periquito*, dim. of *perico*, parrot, from *Pedro*, Lat. *Petrus*, Gk. Πέτρος, Peter, from πέτρος, rock; also explained as from It. *parrocchetto*, dim. of *parroco*, parish priest, jestingly applied to the bird). Any of many small kinds of parrots, especially the long-tailed East Indian and Australian species of the genus *Palæornis* and its allies. The American parakeets are chiefly of the genus *Conurus*. One species of a closely related genus was formerly found within the limits of the United States and not elsewhere. At the beginning of the nineteenth century the Carolina parakeet (*Conuropsis carolinensis*) was found throughout the eastern and central United States as far north as Nebraska, Wisconsin, and central New York. It was not merely a summer visitor, but appeared also in winter, so that it was remarkably hardy for a parrot. At the beginning of the twentieth century the species was almost extinct, and survived only in the most inaccessible parts of Florida and Indian Territory, and at present it has probably entirely vanished, except for a few specimens in captivity. It is a beautiful bird, and also noisy, gregarious, and tame, so that it has been an easy victim. It is a trifle more than a foot long, bright green in color, with the head and neck yellow, forehead, cheek, and bend of wings orange. It feeds on seeds, nuts, etc., and is very destructive to fruit. On account of the damage it did in orchards it was ruthlessly killed in early days. Its nesting habits have never been authentically described, and there is some dispute as to whether its eggs are laid in a hole in a tree as is customary with parrots. One of the most beautiful groups, combining gracefulness of form with splendor of plumage, is that to which the Alexandrina or ring parakeet (*Palæornis alexandri*) belongs. This bird is about the size of a common pigeon, green, with a red collar, and is a native of the East Indies. It is said to have been brought to Europe by Alexander the Great's expedition to India, and to have been the first parrot known to the Greeks and Romans, by whom it was highly prized, as it still is, not only for its beauty, but for its docility and its power of imitating human speech. Immense flocks live in some of the coconut groves of western Ceylon and fill the air with deafening screams. The ring parakeet has many congeners, natives chiefly of the East Indies, which exhibit much variety of splendid plumage, among which the East Indian rose-

ringed (*Palæornis torquata*) is one of the most familiar; its general color is green, the neck of the male ornamented with a rose-red, black-edged collar.

Much like them in length and form of tail, but with longer and stronger legs, is the small ground parakeet (*Pezoporus terrestris*) of Australia and Tasmania. This bird inhabits thickets and runs much on the ground, but occasionally takes a short low flight. It makes no nest, but lays its eggs in a hole in the ground. Its colors, dark green above and yellowish below, are less brilliant than in many of the parrot tribes, but the bird is finely marked and mottled. Its flesh has a very strong game flavor. There are numerous other Australian species, distributed in several genera, some of which exhibit great splendor of plumage. Most familiar is the grass, shell, or zebra parakeet (*Melopsittacus undulatus*), a very beautiful little bird, which has long been one of the favorite cage birds in all parts of the world and often sells under the dealers' name budgerigar (q.v.). It is small, slender, and long-tailed. It has a yellow head, with three black cheek spots surmounted by a blue patch; the back is yellow, with black transverse markings; the wing quills brown, with green outer webs and yellow margins; the rump and under parts green, the tail green, bounded with yellow, but with the two central quills blue. (See Plate of PARROTS.) Of *Platyercus* and closely allied genera there are over 50 species. These are found throughout Australia and are the commonest varieties exported. In the vast inland plains of Australia these parakeets are to be seen in flocks of many hundreds feeding on the seeds of the grasses, which afford food also to many other small grass parakeets, such as those of the genus *Euphema*, or *Neophema*.

PARRAL, pär-räl', or HIDALGO DEL PARRAL. A city of the State of Chihuahua, Mexico, on the Parral, 120 miles south of Chihuahua (Map: Mexico, F 4). The town possesses very old and productive silver mines and is now the centre of one of the most important mining regions of Mexico. It is in the midst of the wine-making district of Mexico. A United States consular agent is stationed here. Pop., 1900, 14,748; 1910, 14,067.

PARRAMATTA, pär'-mät'tä. A town in Cumberland County, New South Wales, Australia, situated on the Parramatta River, 14 miles northwest of Sydney, with which it is connected by steamer and railway (Map: New South Wales, F 3). It is the centre of an extensive fruit-growing district and has an important tweed factory, government buildings, hospital, homes for the infirm and indigent, and a beautiful and well-cultivated pleasure ground (the old Domain), in which was situated the Government House, inhabited by the state's earliest rulers. Formerly called Rosehill, Parramatta is, with the exception of Sydney, the oldest town in Australia. The first grain raised in the state was grown here and the first grants of land were here made. Here is the oldest grammar school in Australia. Pop., 1911, 12,465.

PARRAS DE LA FUENTE, pär-räs dâ lä fwân'tä. A town of the State of Coahuila, Mexico, situated near the east shore of Lake Parras (Map: Mexico, H 5). The town lies in a fertile valley and is surrounded by orchards and vineyards. Its chief manufactures are wines and raisins. Pop., 1900, 6,476; 1910, 6,252.

PARRATT, SIR WALTER (1841-). An English organist and composer, born at Huddersfield. His first organ appointment, at a church near Huddersfield, was received when he was only 11. The next year he was appointed organist of St. Peter's Church, London, and studied with George Cooper. In 1854 he returned to Huddersfield, coming to be in great request for organ recitals throughout the north of England. In 1861 he accepted an appointment at Worcester, where he was also private organist to the Earl of Dudley. In 1872 he became organist of Magdalen College, Oxford. On the retirement of Sir George Elvey as the organist of St. George's Chapel, Windsor, Parratt was appointed to fill the vacant position. He was knighted by the Queen in 1892, received the appointment of private organist to her Majesty, and the following year became master of the Queen's music. Under King Edward VII he occupied the corresponding offices. In 1908 he succeeded Sir Hubert Parry (qv) as professor of music at Oxford. His compositions, while not numerous, are of a high order of merit. They include music to the *Story of Orestes*, many anthems and services, and a few songs. Parratt edited *Choral Songs by Various Writers and Composers* (1889) and contributed 10 important articles to *Grove's Dictionary of Music and Musicians* (1879-89).

PARRHASIUS (Lat., from Gk. Παρρῆσιος). One of the greatest painters of ancient Greece, the son of Evenor, himself an artist. He was a native of Ephesus, but, like his elder contemporary Zeuxis, practiced his profession in many places and seems to have received Athenian citizenship as a reward for his picture of Theseus, since later writers sometimes call him an Athenian. He lived near the end of the fifth century B.C. Certainly apocryphal is the story of Seneca that for his painting of Prometheus he tortured a captive from Olynthus, as the artist could scarcely have been living at so late a date (347 B.C.) if he were a celebrated painter during the lifetime of Socrates, over 50 years before. (Cf. Xenophon, *Memorabilia*, iii, 10.) His art is known to us only from ancient criticism and chiefly from a passage in Pliny, *Hist. Nat.*, xxxv, 67, where he is praised as the first to introduce accurate proportions into painting and as especially successful in his drawing and rendering of contours. It seems that he was the first successfully to employ light and shade in such a way as to suggest the round as distinguished from the relief. His painting of the Athenian Democracy (*Demos*) was held to express in a wonderful way the variety of disposition which marked that very variable person.

PARRICIDE (Lat. *parricida*, OLat. *paricidas*, murderer of his parent, of a magistrate, or of a free citizen, assassin, probably from *par*, equal + *oedere*, to kill; associated in popular etymology with *pater*, father). One who kills his father, or a man who stands in the place of a father, as a father through adoption. The term is derived from the Roman law, where the crime of *parricidium* included the murder of many near relatives besides the father, as a grandfather, son, brother, sister, and others. By the *lex Pompeia de Parricidiis* (52 B.C.), the murder of an ascendant, as a father or grandfather, or of a son, was punished in most severe manner, the parricide being sewed up in a leather sack, along with a live dog, viper, cock,

and ape, and cast into the sea or a near-by river. In England and the United States the punishment of a parricide does not differ from that of any other murderer. Consult the authorities referred to under CIVIL LAW; CRIMINAL LAW. See MURDER.

PARRIS, SAMUEL (1653-1720). A New England clergyman. He was born in London, went in youth to Massachusetts, and studied at Harvard College, but did not graduate. After being a successful merchant in Boston, he entered the ministry and was pastor of the church at Danvers, Mass. (then a part of Salem), in 1689-96. He is remembered from the fact that the delusion of Salem witchcraft originated in his family in 1692, his daughter and his niece accusing Tituba, a South African slave living as a servant in the family, with bewitching them. Parris beat her and compelled her to confess herself a witch. The delusion and persecution thus commenced lasted 16 months. Mr. Parris having been a zealous prosecutor in the witchcraft cases, his church brought charges against him. He acknowledged his error, but was dismissed. He preached afterward at Stow, Concord, and Dunstable. Consult his *Life* by Fowler (Salem, 1857), and the bibliographies of SALEM and WITCHCRAFT.

PARRISH, EDWARD (1822-72). An American pharmacist, born in Philadelphia and member of a family of physicians. Graduating from the College of Pharmacy (Philadelphia) in 1842, he engaged in the active practice of his profession. In the College of Pharmacy he was made professor of materia medica in 1864 and in 1867 professor of practical pharmacy. He is best known through a nonofficial preparation, the compound syrup of phosphate of iron, popularly known as Parrish's chemical food. He was president of the American Pharmaceutical Association in 1868. He published: *An Introduction to Practical Pharmacy* (1856, 5th ed., 1884); *The Phantom Bouquet* (Philadelphia, 1863); *Education in the Society of Friends* (ib., 1866).

PARRISH, MAXFIELD (1870-). An American illustrator, painter, and decorator, son of Stephen Parrish. He was born in Philadelphia and studied at the Pennsylvania Academy of Fine Arts and at the Drexel Institute under Howard Pyle. Although he traveled widely in connection with his profession, he never studied abroad. He soon became known for his original decorative posters and richly colored designs for magazine covers. His work shows an unfailing fertility of invention, combining delightful fantasy with joyous, whimsical humor. It is especially happy in its reflection of the child imagination, picturing incomparably, e.g., the events of the Arabian Nights. The execution is careful as to details, yet broad in handling, delicate and sure in line; the color, laid on in flat, cleverly considered masses, is softly rich and glowing. Among the most important books illustrated by him are: Kenneth Grahame's *The Golden Age and Dream Days*; Eugene Field's *Poems of Childhood*; *Mother Goose in Prose*; Irving's *Knickerbocker History of New York*; Mrs. Wharton's *Italian Gardens*. As time went on Parrish devoted himself increasingly to mural decoration. His notable achievements in this art include the well-known "Old King Cole" in the Knickerbocker Hotel, New York, decorations in hotels in Chicago and San Francisco, and an important series of 17

panels, completed 1912, for the building of the Curtis Publishing Company, Philadelphia. In 1906 Parrish was elected to the National Academy of Design, and he became a member of the National Institute of Arts and Letters. He made his home at Cornish, N. H.

PARRISH, STEPHEN (1846-). An American landscape painter and etcher, the father of Maxfield Parrish. He was born in Philadelphia. At first a business man, later he took up etching and then painting. His first plate appeared in 1879. Among his paintings are "Low Tide," "Evening," and "The Road to Perry's Peak." His subjects are usually large, open expanses of country—often winter scenes—treated with much poetic feeling. His etchings, which are sincere and powerful and have frequently been exhibited in Europe and America, include the series "Cape Ann to Marblehead" and other American seaboard scenes. Fine examples are in the New York Public Library and collections of prints elsewhere.

PARROCEL, pá'rô'sél'. A family of French painters, the first of whom was **BARTHELEMY** (c.1600-c.60), a painter of religious subjects—The most important was **JOSEPH** (1646-1704), the battle painter, born at Brignolles. He studied under his elder brother, Louis, and also under Le Bourguignon in Rome, and was made a member of the French Academy of Fine Arts in 1676. He is said to have known nothing of actual soldiering, but he had a vigorous brush and considerable skill in composition. There are pictures by him in the Louvre and at Versailles. He also left numerous rather inferior etchings after his own designs.—Other painters of this name were his son, **CHARLES** (1688-1752), a battle painter, who depicted the campaigns of Louis XV; his nephew, **PIERRE** (1670-1730), whose subjects were mostly religious; and **IGNACE FRANÇOIS** (1704-81), son and pupil of Pierre, an historical and genre painter.

PARROQUET. A variant spelling of parakeet (q.v.).

PARROT (probably from Fr *Perrot*, *Pierrot*, dim. of *Pierre*, Peter). A bird of the group Psittaci or the order Psittaciformes, which is related to the cuckoos and plantain eaters. It was formerly divided into two families, the Psittacidae and Trichoglossidae, but the latest revision increases this number to six, Nestoridae, Loridae, Cyclopsittacidae, Cacatuidae, Psittacidae, and Stringopidae. The order includes 83 genera and about 625 species and subspecies. Most of them are natives of the tropics and especially of the Australian and Malayan regions. There are 50 species in Australia, and over 100 species occur in New Guinea alone. South America has more than 160 species, and Africa and southern Asia the remainder. Few inhabit or even enter the temperate zone, the most northerly one, perhaps, being the now nearly or quite extinct Carolina parakeet (q.v.) of the United States. The determining feature in the family is the beak, which is short, stout, and greatly arched, the upper mandible hooking over the lower and movably hinged to the skull. The feet are short and strong, and the toes are two before and two behind. The wings are likely to be rather short and in some groups rounded; and the tail may be short and broad, as in the true parrots, or very long and pointed, as in the parakeets, noticeably broad in others, and so on. Most parrots are gaudily colored, but some are soberly clad; and there is likely to be a crest—very

prominent in the cockatoos and less so in some others—or other modifications of the feathers of the head, as in the facial disks of the owl parrots or kakapos. (See KAKAPO.) The sexes are usually much alike.

Most parrots are forest birds, although a few are of terrestrial habits and are styled ground parrots, and a few others, like the grass parakeets, inhabit grassy or brushy plains. As a rule, also, they are gregarious, and many species go in large flocks. Their food with few exceptions is vegetable—plantains, papaw apples, figs, and tamarinds being varied by flowers, buds, leaves, palm nuts, and other hard fruits, grass seeds, and grain. This supplies so much moisture that little drinking seems necessary. Exceptional foods are the bulbs and tubers for which cockatoos dig, while some species search the bark of trees for insects, or extract honey and insects from flowers with their brush-tipped tongues. (See LOBY.) Lastly, the kaka (q.v.) has acquired a taste for flesh. Most parrots gather their food by climbing about the branches like the nimblest of acrobats, using their beaks freely in support of their bodies, and manipulating their food with their claws as no other bird ever does.

The voices of parrots, as a rule, are harsh, and the great macaws and cockatoos scream most discordantly. Some, however, utter low and sweet twittering notes. Many have great facility in imitating other sounds or human speech, and some learn to articulate words and phrases with much distinctness, if given patient training. There is a popular notion that this process may be aided by slitting the tongue—a practice as useless and foolish as it is barbarous. It is not certain that the tongue has anything more to do with the enunciation of parrots than in the case of other birds, where it plays no part in utterance. The tongue is always large, round, and fleshy. In the subfamily Nestorinae (the kakas) it is fringed, and in lorics it has a brush of hairs towards the tip.

The typical and perhaps the best-known parrot is the African gray parrot (*Psittacus erithacus*) of equatorial Africa, which is ashy gray, with black wing quills, a red tail, and whitish, naked face. It is in high esteem among most of the African tribes, who rear it from the nest as a house pet, enjoy its flesh, and seek its feathers as ornaments, some setting apart the red tail feathers for their chiefs as insignia of rank. Long ago these parrots were carried to Europe, and afterward to all parts of the world, and have shown themselves not only hardy, long-lived, and affectionate, but the clearest talkers of the whole tribe. A closely allied but much darker West African species has less ability in the learning of words and phrases. In their native wilds these parrots go about in flocks during the day and return at night to certain "roosts." They eat various fruits and nuts, especially palm nuts. They breed in holes in trees, often in companies, and aid one another in defending their homes. All parrots nest in holes in trees except a few aberrant ones, like some in New Zealand, which lay their eggs in holes or hollows of the ground or among rocks. All lay white eggs. Fossil representatives of this tribe carry its history back to the Lower Miocene age.

Bibliography. The standard work on the subject is that by A. T. Salvadori, *Catalogue of the Psittaci or Parrots in the Collection of the*

PARROTS

Greene, *Parrots in Captivity* (3 vols., ib., 1884-87); Alfred Newton, *Dictionary of Birds* (New York, 1893); A. H. Evans, *Birds* (ib., 1900); Hutton and Drummond, *Animals of New Zealand* (London, 1905); C. N. Page, *Parrots and Other Talking Birds: Their Food, Care, and Training* (Des Moines, 1906). See Colored Plate of PARROTS; Plate of PARROTS and PARAKEETS; Plate of COCKATOOS and MACAWS.

PARROT FISH, or LORO. Any of many species of the family Scaridae, particularly of the genus *Scarus*. The form is oblong and massive, with large scales. They are fishes of brilliant colors in general, and some have wonderful splendor and have received their name partly on this account and partly on account of a fancied resemblance in their jaws to a parrot's bill. They are mostly herbivorous, some feeding on corals, and are not good food fishes. Most of them are natives of the tropical seas. One species in the Mediterranean (*Scarus creticus*) is the scarus of the ancients. Several species inhabit tropical American waters and are known in the West Indies as loros, viejas (i.e., old wife), guacamaías, etc. The name is given in 'Australia' to *Pseudoscarus pseudolabrus*, called parrot perch. In Victoria and Tasmania there are also several species of *Labrichthys*.

PARROTT, ROBERT PARKER (1804-77). An American soldier and inventor of ordnance, born at Lee, N. H. He graduated at West Point in 1824 and was assigned to the artillery. Until 1829 he remained at the Military Academy as an instructor, then performed garrison duty for several years, and in 1836 saw service against the Creek Indians. He was promoted to be captain of ordnance early in the same year, but resigned in October to become superintendent of the West Point Iron and Cannon Foundry at Cold Spring, N. Y., a position which he held until 1867. While there he invented the famous Parrott cannon used by the Federal army and navy during the Civil War. Captain Parrott was first judge of the Court of Common Pleas in Putnam County from 1844 to 1847, and was superintendent of schools at Phillipstown from 1848 until 1856. See ORDNANCE.

PARRSBORO, pärz'bür-ô. A town and the county seat of Cumberland County, Nova Scotia, Canada, on the Basin of Minas and on the Cumberland Railway and Coal Company Railway (Map: Nova Scotia, F 5). Several steamship lines connect it with other Nova Scotian ports. It is an important coal and lumber shipping point. Its industrial establishments include shipbuilding yards, woodworking plants, and others. The town owns its electric-lighting plant and water works. Pop., 1901, 3391; 1911, 2856.

PARRY, CHARLES CHRISTOPHER (1823-90). An American botanist, born in Worcestershire, England. He was educated at Union College and afterward practiced medicine in Davenport, Iowa. His study of the botany of the district resulted in his appointment to the geological survey of the Northwest (1848), then to the survey of the Mexican boundary (1849-52), and he was successively botanist to the Pacific Railroad survey of the thirty-fifth parallel and to the Department of Agriculture from 1867 to

1871. His publications include: *Botanical Observations in Western Wyoming* (1874); *Botanical Observations in Southern Utah* (1875); *Revision of the United States Pacific Coast Species of Arotostaphylos* (1883); *Revision of the Genus Chorizanthe* (1884); *The North American Genus Ceanothus* (1888).

PARRY, pär'l, SIB (CHARLES) HUBERT HASTINGS (1848-). An English composer and musical scholar, born at Bournemouth, Feb. 27, 1848. At the age of seven he was sent to a private school at Malvern. His earliest attempts at music, in the form of chants and hymn tunes, date from this time. In 1860 he was sent to Twyford School and took lessons from the village organist; while there he came under the influence of Samuel Sebastian Wesley, the organist of Winchester Cathedral. In 1861 he entered Eton. He studied composition under Elvey and often acted as composer, organist, or vocalist for the musical society of the college. In 1867 he entered Exeter College, Oxford. He obtained in 1874 his degree of master of arts and took advanced study in music under Bennett and Macfarren, together with an extended course under Dannreuther. After three years in a business house, and against the wishes of his family, Parry devoted himself entirely to music. He was appointed choragus of Oxford University in 1883 and in the same year was granted the degree of musical doctor by Cambridge, followed in 1884 by Oxford and in 1891 by Dublin. In 1891, also, he became professor of composition and history of music at the Royal College of Music and in 1894 its director, succeeding Sir George Grove. From 1900 to 1908 he was professor of music at Oxford. He was knighted by Queen Victoria in 1898, and at the coronation of Edward VII, in 1903, was created Baronet. Although his *Intermezzo Religioso* for string orchestra was produced at the Gloucester Festival of 1868, he remained practically unnoticed until 1880, when Dannreuther played his piano concerto in F sharp minor and when his *Scenes from Shelley's Prometheus Unbound* was heard at the Gloucester Festival. From then on until 1907 Parry produced every year some larger work at one of the English festivals. Some English critics regard him not only as the greatest figure in modern English music, but as the greatest since the days of Purcell (q.v.). But the fact remains that Parry's works have not been able, so far, to secure a foothold outside of his native land. His principal works are the oratorios *Judith* (1888), *Job* (1892), *King Saul* (1894); five symphonies in G, F, C, E minor, B minor; incidental music to Aristophanes' *Birds*, *Frogs*, and *Clouds*, *Æschylus' Agamemnon*, and Ogilvie's *Hypatia*; a great deal of chamber music; six books of *English Lyrics*. His reputation, however, rests chiefly upon his great choral works with orchestra, of which the following are the more important: *The Glories of our Blood and State* (1883); *Blest Pair of Sirens* (1887); *Ode to St. Cecilia's Day* (1889); *Allegro ed il Penseroso* (1890); *War and Peace* (1903); *The Pied Piper of Hamelin* (1905); *The Soul's Ransom* (1906). His writings, which exhibit sound scholarship and original thought, include: *The Evolution of the Art of Music* (1896); *The Seventeenth Century* (1902), being the third volume of the great *Oxford History of Music*; *Style in Musical Art* (1912). In addition he was one of the most

Sp., Portug., It. *pastinaca*, from Lat. *pastinaca*, parsnip, from *pastinum*, a sort of two-tined dibble), *Pastinaca*. A genus of annual, biennial, and perennial herbs of the family Umbelliferae, with carrot-like fleshy roots and pinnate leaves. The common parsnip (*Pastinaca sativa*), a native of Europe and northern Asia, is a biennial, with angular-furrowed stems 2 to 3 feet high, ovate leaflets, white roots, which are aromatic, mucilaginous, sweet, but slightly acrid. Cultivation has greatly modified the qualities of the roots, rendering them much more bland and greatly increasing their size and fleshiness, thus improving their edible qualities. The parsnip delights in a very open rich soil, but will succeed in clayey soils far too stiff for the carrot. The mode of cultivation of the parsnip scarcely differs from that of the carrot. The parsnip is used chiefly in winter, whether for the table or for feeding cattle, for which it is highly valued, especially in Europe. It is improved rather than injured by frost, but is apt to become acrid after it has begun to grow again in the spring. The cut-leaved parsnip or sekakul (*Pastinaca sekakul*, or *Malabaila pumila* of some botanists), with pinnatifid cut leaflets, a native of India, Syria, and Egypt, cultivated in the Levant, is very similar in its uses to the common parsnip. The wild form, devoid of the thickened root, is a weed in the northeastern United States and adjacent Canada. See Plate of ONIONS, OYSTER PLANT, ETC.

PAR'SON (OF. *persone*, Fr. *personne*, from ML. *persona*, person, curate, parson, Lat. *persona*, person, actor's mask). Strictly, one who has full possession of all the rights of a parochial church, as the representative or impersonator of the Church, which is an invisible body. The term is used loosely for any clergyman.

PARSON BIRD, or TUI. The mimic of the New Zealand bush and the possessor of a beautiful natural note (*Prosthemadera nova-zelandia*, of the family Meliphagidæ). Its plumage is black, excepting two small outgrowths of white feathers, one on each side of the throat, which

THE PARSON BIRD

suggest the bands of a clergyman in a Geneva gown. Consult Buller, *Birds of New Zealand* (2d ed., London, 1888), and Hutton and Drummond, *Animals of New Zealand* (ib., 1905). See Plate of CREEPERS.

PARSONS. A city in Labette Co., Kans.; 137 miles south by west of Kansas City, on the Missouri, Kansas, and Texas and the St. Louis and San Francisco railroads (Map: Kansas, G 8). The State hospital for epileptics is situated here, and among other prominent structures are the high school, the Missouri, Kansas, and Texas railroad depot, Mathewson Hotel, the business college, Carnegie library, Federal building, Masonic Temple, Elks Theatre,

and the railroad Y. M. C. A. There are two fine parks, Forrest and Glenwood. The Missouri, Kansas, and Texas maintains here general offices and extensive car and machine shops. The industrial establishments include flouring and feed mills, grain elevators, creameries, a foundry, chicken-feed factories, nurseries, skirt and shirt factories, etc. Natural gas is used generally for fuel and lighting. Founded and incorporated as a third-class city in 1871, Parsons became a city of the second class in 1873. The government is administered by a mayor and four commissioners. Pop., 1900, 7682; 1910, 12,463; 1914 (U. S. est.), 14,500.

PARSONS. A borough in Luzerne Co., Pa., adjoining Wilkes-Barre on the north, and on the Delaware and Hudson and the Central of New Jersey railroads. Coal mining, oil refining, and the manufacture of tinware and silk goods are the leading industries. Pop., 1900, 2529; 1910, 4338.

PARSONS, ALFRED WILLIAM (1847-). An English landscape painter, born at Beckington (Somerset). He worked for two years as a post-office clerk in London, studying art in the evening at the South Kensington Schools, then took up painting as a profession and worked by himself from nature. He first exhibited at the Royal Academy in 1871. Equally proficient in oil, water color, or black and white, Parsons excels in depicting rural English simplicity; but in all his landscapes, whether of America, Japan, or Britain, he preserves the particular charm of the country. His sketches are peculiarly expressive and significant and his style distinctively individual, fresh, and graceful. His works include "When Nature Painted All Things Gay" (1887, Tate Gallery), "A Mid-May Morning," "The First Frost," and "The Village by the Links." He received a gold medal at Paris in 1889 and two medals at Chicago in 1893. His illustrations include those done with E. A. Abbey for *Old Songs* and *A Quiet Life*; *The Warwickshire Avon*; *Wordsworth's Sonnets*; *Notes in Japan*; and *The Danube from the Black Forest to the Black Sea* (1891, with F. D. Millet). He became president of the Royal Water Color Society and was elected Royal Academician (1911).

PARSONS, CHARLES (1821-1910). An American landscape painter and illustrator, born in Manchester, England. He studied at the National Academy of Design, New York, early became associated with illustrated journalism, and afterward worked in lithography, his landscapes and views of New York City and harbor being particularly noteworthy for their finished workmanship. From 1861 until 1889 he had charge of the art department of Harper and Brothers, New York. Parsons also painted landscapes and marines in water color. He was elected an associate of the National Academy of Design (1862) and a member of the American Water Color Society.

PARSONS, SIR CHARLES ALGERNON (1854-). An English inventor and shipbuilder, fourth son of William Parsons, third Earl of Rosse (q.v.). Educated at St. John's College, Cambridge, of which he became honorary fellow, Parsons was elected to the Royal Society in 1898, became high sheriff of Northumberland, and received the K.C.B. in 1911. He was proprietor of the engineering and electrical works, C. A. Parsons and Co., at Heaton, Newcastle, and head of the Parsons Marine Steam Turbine

Company and of two electrical-supply companies. His inventions include: nonskid chains for automobile tires, an auxetogramophone in 1898; and the compound steam turbine known by his name, introduced about 1884, improved by a condenser in 1891, and adapted for maritime use on the *Turbima* in 1897. About 1910 he invented a geared turbine. He published *The Steam Turbine* (1912), the Rede Lecture for 1911. See STEAM TURBINE.

PARSONS, CHARLES LATHROP (1867-). An American chemist, born at New Marlboro, Mass. He graduated from Cornell University in 1888 and from 1890 to 1911 was professor of chemistry at New Hampshire College. In the latter year he became chief mineral chemist of the Bureau of Mines at Washington, D. C. Parsons was awarded the Nichols medal in 1904 for research on the atomic weight of beryllium and in 1911 received the honorary degree of Sc.D. from the University of Maine. His publications include: *Mineralogy, Crystallography, and Blowpipe Analysis* (1895; 5th ed., 1911), with A. J. Moses, *Beryllium: Its Chemistry and Literature* (1908); *Fuller's Earth* (1913).

PARSONS, FRANK (1854-1908). An American political scientist, born at Mount Holly, N. J. He graduated at Cornell in 1873 and in 1892 became lecturer on law at Boston University. From 1897 to 1900 he was professor of history and political science at the Kansas Agricultural College and became professor of political science and dean of the College of Liberal Arts, Ruskin University. He wrote: *The World's Best Books* (1889, 3d ed., 1893), *Our Country's Need* (1894); *The Drift of our Time* (1898), *The New Political Economy* (1899), *The Bondage of Cities* (1900); *The City for the People* (1899, rev. ed., 1901), *The Story of New Zealand* (1904), *The Heart of the Railroad Problem* (1906); *The Railways, the Trusts, and the People* (1906).

PARSONS, HERBERT (1869-). An American political leader, born in New York City. He graduated at Yale in 1890, studied at the University of Berlin in 1890-91 and at the Harvard Law School in 1891-93, and was admitted to the bar in 1895. He was a member of the New York board of aldermen in 1900-03, and from 1905 to 1911 was Republican Representative from the thirteenth New York district. From 1905 to 1910 he was chairman of the New York County Committee, and he was largely instrumental in the latter year in bringing about the nomination of Charles E. Hughes as Republican candidate for Governor of New York. In 1914 he supported the candidacy of Charles S. Whitman for Governor of New York and in 1915 was delegate at large to the New York Constitutional Convention.

PARSONS, JOHN EDWARD (1829-1915). An American lawyer, father of Herbert Parsons. He was born in New York City, graduated from the University of the City of New York in 1848, and was admitted to the bar in 1852. He participated in the conduct of many important lawsuits and was counsel until 1910 and director until 1911 of the American Sugar Refining Company (the "Sugar Trust"). He became a director of the Metropolitan Trust Company, was one of the founders of the General Memorial Hospital, served as president of the Woman's Hospital, and was also identified with the work of Cooper Union.

PARSONS, or PERSONS, ROBERT (1546-

1610). An English Jesuit and controversialist, born at Nether Stowey, Somersetshire, educated at Oxford, elected fellow of Balliol (1568) and subsequently dean (1574). In 1574 he left Oxford, proceeded to Louvain, and was received into the Roman Catholic church, joining the Jesuits (1575) and ordained priest (1578). In 1580 he was sent with Edmund Campion to England to help the secular clergy. He issued, in conjunction with Campion, many pamphlets, among which were *A Brief Discourse Containing Certain Reasons why Catholics Refuse to Go to Church* (1580), and Campion's more famous *Decem Rationes* (1581). In 1581 Campion was caught and executed, but Parsons escaped to Normandy. His great energies were now devoted to the restoration of the Catholic church in England. Going to Spain, he urged on the attempted invasion of Philip II, which resulted in the disaster of 1588. He also labored at the Catholic courts of Europe to save Mary, Queen of Scots. A skillful organizer, he founded schools for English Roman Catholics at Eu in Normandy (1584), at Saint-Omer (1592), and at several places in Spain. Appointed rector of the English College in Rome in 1597, he exerted immense influence. Parsons died in Rome, April 15, 1610. He wrote a clear and vigorous English style, which was commended by Swift and Gibbon. Consult Foley, *Records of the English Province of the Society of Jesus* (5 vols., London, 1877-79).

PARSONS, SAMUEL HOLDEN (1737-89). An American soldier and judge, born at Lyme, Conn. He graduated at Harvard in 1756, studied law at Lyme, Conn., with Gov. Matthew Griswold (his uncle), began practice in 1759, and was for 18 years a member of the Connecticut Assembly. In 1774 he removed to New London and became a member of the Connecticut Committee of Correspondence. At the outbreak of the Revolutionary War he took command of the Sixth Connecticut Regiment, was present at the siege of Boston and at the battle of Long Island, and planned the attack on Ticonderoga, being promoted for his services to the rank of brigadier general in August, 1776, and of major general in 1780. At the close of the war he practiced law at Middletown, Conn. In 1785 he was a member of a commission appointed to treat with the Miami Indians, in 1788 he sat in the convention which ratified for Connecticut the Federal Constitution, and in 1789 he became, on Washington's appointment, the first judge of the Northwest Territory. He settled near Marietta, Ohio, and soon afterward, on behalf of Connecticut, bought from the Indians about Lake Erie their claim to the Western Reserve. He was drowned in the Big Beaver River while returning from this expedition. Within recent years letters have been discovered which seem to convict Parsons of treason in supplying the British with information during the Revolutionary War. Parsons published a paper on the "Antiquities of the Western States," in vol. 11 of the *Transactions of the American Academy of Arts and Sciences*. Consult G. B. Loring, *A Vindication of General Parsons* (Salem, Mass., 1888), and C. S. Hall, *Life and Letters of Samuel Holden Parsons* (Binghamton, 1905).

PARSONS, THEOPHILUS (1750-1813). An American jurist. He was born at Byfield, Mass., Feb. 24, 1750, and graduated at Harvard in 1769. From 1770 to 1773 he taught school at

Falmouth, now Portland, Me., at the same time studying law, and was admitted to the bar in 1774. He began the practice of his profession at Falmouth, which was laid waste by a British squadron in October, 1775; and Parsons, whose prospects for professional success at Falmouth were ruined by this disaster, returned soon afterward to Byfield, his native town. There for some years he studied under Judge Edmund Trowbridge of the Massachusetts Superior Court. Parsons finally removed to Newburyport, where he soon acquired an extensive practice. In 1778 he was active in the discussion of the new constitution of Massachusetts, then recently framed by the Legislature. Parsons was strongly opposed to the adoption of that instrument; he was a member of the Essex Junto, which comprised a large number of the citizens hostile to the new constitution; and the pamphlet called *The Essex Result*, which had a great influence in bringing about the defeat of the constitution, is attributed to him. In 1779 he sat in the convention which drew up the constitution which with some changes still exists as the fundamental law of Massachusetts. In 1788 he was a member of the State convention called to ratify the Federal Constitution, which he warmly supported, and the so-called *Proposition* in favor of its adoption, though offered by John Hancock, was drawn up by Parsons. He settled in Boston in 1800. From 1806 until his death he was Chief Justice of the State Supreme Court. A memoir (Boston, 1859) was prepared by his son, Theophilus. Consult his *Commentaries on the Law of the United States* (Boston, 1836); S. L. Knapp, in *Biographical Sketches of Eminent Lawyers*, vol. i (ib., 1821); E. F. Stone, *Parsons and the Constitutional Convention* (Salem, 1899).

PARSONS, THEOPHILUS (1797-1882). An American jurist and legal author, born at Newburyport, Mass., in 1797. He graduated at Harvard in 1815, was admitted to the bar, and began to practice in Taunton. Soon afterward he removed to Boston, where he became the founder and editor of the *United States Literary Gazette*. He was also a frequent contributor to the *North American Review*. In 1847 he was appointed Dane professor of law in the law school of Harvard University, an office which he filled with distinction for a quarter of a century. His works are characterized by accuracy and practical usefulness to the profession rather than by profundity of knowledge or great legal acumen. They were consequently very successful in winning the favor of the profession and through successive revisions retained their position as useful legal handbooks for half a century. His best-known works are: *Treatise on the Law of Contracts* (1853; 9th ed., 1904); *Elements of Mercantile Law* (1856); *Law of Partnership* (1867; 4th ed., 1893); *Marine Insurance Average* (1868). Parsons was a Swedenborgian, and he produced a number of works maintaining the doctrines of the New Jerusalem church. The most important are: *Essays*, in three series; *Deus Homo* (1867); *The Infinite and the Finite* (1872).

PARSONS, THOMAS WILLIAM (1819-92). An American poet and translator of Dante, born and educated in Boston. In 1836 he went to Italy, where his studies in the literature of that country resulted in his well-known translation of the first 10 cantos of Dante's *Inferno* (1843). This part of the *Divina Commedia* he completed

in 1867. He translated much of the *Purgatorio* and a few fragments of the *Paradiso*, but he never completed the work. He later took up dentistry as a profession and practiced in Boston and in London. The last 20 years of his life were spent in or near Boston. Parsons owes his fame almost wholly to his rendering of Dante. Most of this translation is in rhymed couplets. Aside from his Dante translations, his work includes: *Ghetto di Roma* (1854); *The Magnolia, and Other Poems* (1867); *The Old House at Sudbury* (1870); *The Shadow of the Obelisk, and Other Poems* (1872). He is the Poet of Longfellow's *Tales of a Wayside Inn*. Parsons died in Scituate, Mass., Sept. 3, 1892. His poems appeared in a definitive edition in 1893.

PARSONS, USHER (1788-1868). An American surgeon, born at Alfred, Me. He studied medicine under Dr. John Warren in Boston and entered the navy in 1812. As acting surgeon he was in sole charge of the wounded on the flagship *Lawrence* at the battle of Lake Erie in consequence of the illness of the two other surgeons. For his conduct at that time he was promoted to full surgeon. After eight years of duty he resigned and settled in Providence, R. I. He was professor of anatomy at Dartmouth in 1820-22 and at Brown from 1823 to 1828, and president of the Rhode Island Medical Society from 1837 to 1839. Among his writings are: *Sailor's Physician* (1824; 4th ed., 1851, as *Physician for Ships*); *Directions for Making Anatomical Preparations* (1831); *Battle of Lake Erie* (1852); *Brief Sketches of Officers who Were in the Battle of Lake Erie* (1862).

PARSONS, WILLIAM. See ROSSE, 3d EARL OF.

PARSONS, WILLIAM BARCLAY (1859-). An American civil engineer, born in New York City. He graduated A.B. in 1879 and C.E. in 1882 from Columbia University and then established himself in general practice in New York. Parsons also served as chief engineer of the Rapid Transit Commission of New York from 1894 to 1905 and as a member of the Isthmian Canal Commission (1904) and of the board of consulting engineers of the Panama Canal (1905). He wrote: *Track* (1885); *Turnouts* (1885); *An American Engineer in China* (1900).

PARSONS' CAUSE. The name of a celebrated case decided by the court of Hanover Co., Va., in December, 1759, remembered chiefly because of a speech made before the court by Patrick Henry (q.v.). From the earliest history of the Colony the salaries of the clergy in Virginia had been paid in the form of tobacco, long the Colony's chief staple. Owing to fluctuations in the value of tobacco, the actual amount thus paid had varied widely, the clergy receiving the advantage of a rise in price and correspondingly suffering the disadvantages of a fall. In 1748 the Legislature of Virginia passed an Act fixing the salary of the clergy at some 17,000 pounds of tobacco, and George II formally approved the Act. In 1758, when the price of tobacco was unusually high on account of a probable failure of the crop throughout the province, the Legislature passed an Act, to be in force for 12 months, similar to a previous Act of 1755, which had lapsed and which had provided that the salary of the clergy might be paid in paper currency instead of tobacco, at the rate of twopence per pound, a price below the market value of tobacco at that time. The

operation of the Act was limited to one year. The ministers, whose entire income was derived from tobacco, suffered more severely than any other class in the community. Upon the protest of the clergy the Act of 1758 was disallowed by the King, and various clergymen forthwith brought suit against their vestries for the salaries legally due them for the year 1758. One such suit was brought by the Rev. James Maury before the court of Hanover County, of which Patrick Henry's father was the presiding judge, and Patrick Henry, then a young, almost unknown lawyer, was engaged by the defendants as counsel. The court decided against the validity of the Act of 1758, such Act having been disallowed by the crown, but the jury, influenced by an impassioned speech by Henry, returned a verdict of only one penny damages. The speech made by Henry was the first in which he attracted general attention and was sufficiently radical to be considered incendiary and treasonable by the conservative element in the Colony. According to the report of Maury, Henry argued that, since the Act of 1758 was an Act of general utility, it could not be annulled by the King, and asserted that "a king by disallowing acts of this salutary nature, from being the father of his people, degenerates into a tyrant and forfeits all rights to his subjects' obedience." Consult M. C. Tyler, *Patrick Henry* (Boston, 1887), in the "American Statesmen Series."

PARSON'S TALE, THE. The last of Chaucer's *Canterbury Tales* and, like "Melibæus," written in prose. It is a discourse on penitence, from the Vulgate text of Jer. vi. 16, and is mainly an adaptation from Frère Lorens, *La somme des vices et des vertus*, published in 1279, through the English translation entitled *The Avenbite of Inweyt* (Remorse of Conscience). It contains many quotations from the Latin

Ireland, on the Little Brosna, 43 miles north-east of Limerick (Map: Ireland, D 5). It is an important corn market, a considerable centre of inland commerce, a military station, and the seat of a union workhouse, and is one of the handsomest and best-built towns in Ireland. It has several fine churches and chapels, a nunnery, a statue of the Duke of Cumberland, a bronze statue of the Earl of Rosse, a town hall, a library, literary institute, a model school, and other educational institutions. The principal attractions are Birr Castle, the seat of the Earl of Rosse (q.v.), with its observatory, containing a great telescope, 52 feet long, and the laboratory, still maintained in active use by the present Earl. The town manufactures whisky, ale, leather, and flour. Birr had its origin in a monastery founded by St. Brendan in 573 and was the scene of many important events, both in the Irish and in the postinvasion periods. Pop., 1901, 4438; 1911, 4047.

PART (OF, Fr. *part*, from Lat. *pars*, part; connected with Lat. *parare*, to prepare, Gk. *ετορον*, *eporon*, I prepared). In music, when a piece of music consists of several series of sounds performed simultaneously, each series is called a part. In a composition a distinction is made between *real parts* and *auxiliary parts*. Real parts are those that progress through an entire composition as so many individual voices. A vocal fugue may be written for three, four, or five voices. It has therefore three, four, or five real parts, even if one or more voices rest for a number of bars. Auxiliary parts are in reality but detached tones serving to mark a strong accent by doubling some or all tones contained in the real parts. It is evident that in vocal music no auxiliary parts can occur. But in writing for keyed instruments or full orchestra composers make frequent use of such

The image displays a musical score for a piece titled "Parson's Tale". It consists of six staves, each representing a different instrument or voice part. The staves are labeled as follows: Flutes (Sva.), Oboes, Clarionets in A, Bassoons, Horns in A, and Violins. The notation is in a common time signature (C) and features various musical symbols such as notes, rests, and beams. The Flutes and Oboes parts show more complex melodic lines, while the Clarionets, Bassoons, and Horns parts are more rhythmic and harmonic. The Violins part is also melodic and includes some double bar lines. The overall arrangement suggests a full orchestral or chamber music setting.

fathers and was probably once a separate treatise written before 1380.

PAR/SONSTOWN, or BIRR. A market town and urban district in King's County,

auxiliary tones. In a composition for piano-forte, e.g., let us say four real parts are used. In certain places the composer desires more sonority, and there he writes six or even more

tones to be struck simultaneously. Any number above four tones constitutes the auxiliary part, for such voices are added only occasionally. Care must be taken not to introduce auxiliary parts too closely together, as the ear is apt to conceive them as real parts and consequently to demand adherence to the strict rules of progression exacted in the real parts. A splendid example of the use of auxiliary parts is furnished by the opening bars of Beethoven's A Major Symphony, where the strings are used in auxiliary parts to give a strong accent to the first beat of the 1, 3, 5, and 7 measures, while the real parts are given to the wood wind.

In this example the oboes have a real part throughout, the clarinets enter with a real part in the third bar, the flutes in the sixth, the horns in the fifth, the bassoons in the seventh bar. The violins throughout have only additional parts or notes. The detached notes of the other instruments before their participation in the real parts are also considered additional parts. See MUSICAL SCORE, p. 119.

PARTANNA, păr-tân'nà. A town in the Province of Trapani, Sicily, 38 miles southwest of Palermo (Map: Italy, D 6). It is on a hill which commands an extensive view. The remains of Greek works of art and ruins of several Saracenic castles are found here. There is a trade in grain, wine, and oil. Pop. (commune), 1901, 14,059; 1911, 14,122.

PARTANT POUR LA SYRIE, păr-tân' pōōr là sè'rè' (Fr., departing for Syria). A ballad by Count de Laborde (1809). A young warrior, Dunois, by his bravery in Syria, wins a battle and gains the daughter of his lord. Queen Hortense composed music for the ballad, which became extremely popular long after her death, during the Second Empire.

PART BOOK. In music, a book containing an entire part of a composition for a single performer. Before the seventeenth century scores were practically unknown. The individual voices or parts of a polyphonic composition were printed in separate books, just as are the separate parts of an orchestral composition used by the members of a modern orchestra. In order to simplify the interpretation of the music part books were also so arranged that all the parts were printed in a single book, but not in score. The soprano and alto appeared on the left-hand page, while the tenor and bass were printed on the right-hand page.

Soprano	Tenor
Alto	Bass

The music was so arranged that all parts turned at the same time. Jacques Moderne in 1539 printed a part book in such a manner that the four singers could sit opposite, facing each other in pairs.

Tenor	Soprano
Alto	Bass

This was a decided improvement. Such part books containing all the parts were printed in very large type for the convenience of the performers, whereas the single part books were generally printed in very small type.

PARTHENIUS (Lat., from Gk. Παρθένιος). A Greek grammarian and poet, a native of Nicæa in Bithynia, who lived at Rome in the first century B.C. He taught Vergil Greek and was an intimate friend of the elegiac poet Cor-

nelius Gallus, to whom he dedicated his *Erotic Experiences* (Περὶ Ἐρωτικῶν Παθημάτων), the only work of his which has survived. This was a collection of 36 brief stories of unhappy lovers, compiled from ancient poets, and was intended to furnish Gallus with themes for his epic and elegiac poems. The work contains interesting quotations from the Alexandrine poets and is valued as a precursor of the Greek novels. It has been edited by Westermann in his *Mυθολογία* (Brunswick, 1843), by Hirschig, in the *Scriptores Erotici Græci* (Paris, 1856), and by P. Sokolowski and E. Martini, in *Mythographi Græci*, vol. ii (Leipzig, 1896, 1902). According to the Ambrosian manuscript of Vergil, the latter's poem *Moretum* was an imitation of Parthenius' Greek work of the same title. Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911).

PARTHENOGENESIS (Neo-Lat., from Gk. παρθένος, *parthenos*, virgin + γένεσις, *genesis*, production, from γίγνεσθαι, *gignesthai*, to become). The essential phenomenon of sexual generation is the union of a male with a female cell. Within the past half century, however, comparatively numerous cases have been discovered where unfertilized eggs have developed into an adult organism. Such cases in certain animals are known to be in a degree regular, normal methods, and the phenomenon is called agamous, virgin reproduction, or "parthenogenesis," the name proposed by R. Owen. The most typical case of parthenogenesis is that of the *Aphis*, or plant louse. The species is represented in the aphides by eggs alone. (See HOP INSECTS.) In the spring females alone hatch, and no males appear until at the close of summer. Bonnet discovered that a virgin *Aphis* may become the parent of millions of aphids, like itself, there being nine generations through the summer. Duval obtained 11 generations in seven months, while Kyber even observed that a colony of *Aphis dianthi*, which had been brought into a constantly heated room, continued to propagate for four years in this manner without the intervention of males. At the approach of cold weather males appear; they mate with the females, the latter laying eggs. There are thus two sets of females, the parthenogenetic and the normal oviparous forms. The queen bee also lays eggs in the drone or male cells of the honeycomb, which are unfertilized and give rise to males.

Cases of parthenogenesis are known to occur rarely in other Hemiptera than aphids, viz., in bark lice and in the silkworm and 25 or more other species of moths. Among Hymenoptera, besides the honeybee and some wild bees (as *Halictus*), the currant worm (*Nematus ventricosus*) and 12 other species of sawflies have been known to lay parthenogenetic eggs; also many gallflies; in several species of ants and in wasps (*Polistes*) the parthenogenetic eggs produce males. Among beetles *Gastrophysa raphani* and a species of caddis fly are at times parthenogenous; also certain mites and other insects, and in the crustaceans *Apus*, *Artemia*, and *Limnadia*.

It was formerly supposed that these parthenogenetic eggs were different from normal eggs, and they were called "pseudova" by Huxley, but this view is untenable, since these pseudova arise just like ordinary eggs and develop like them, as they undergo cleavage of the yolk

and form germ layers. R. Hertwig claims that parthenogenesis is "a sexual reproduction in which a degeneration of fertilization has taken place, and the facts of parthenogenesis show that under change of conditions the normal mode of sexual reproduction (amphigony) may be modified for the benefit of the species."

Pædogenesis. The larva or maggot of a certain gall-gnat fly is known to produce young which is developed within the body of the larva from a "germ ball" essentially agreeing with an ovary in appearance. The asexual larvæ begin life as egglike bodies developed from the germ ball, just as eggs are developed in the little tubes of which the ovary is an aggregation. Both Wagner and Leuckart conclude that the processes of embryonic growth agree in all essential points with the ordinary phenomena of

PARTHENOGENESIS.

Larva of a gall gnât (Cecidomyidæ) with pædogenetic daughter larvae.

development in a fecundated egg and exactly as in the case of *Aphis* parthenogenesis. The only difference consists in the germ chambers of the cecidomyid larvæ separating from the germ stock and moving freely about in the cavity of the body, while in the aphids, in which there is no metamorphosis, the germ stock is a true ovary. It thus appears that the free ovary or germ mass of the parent maggot becomes prematurely developed, and the growth of young is thus greatly accelerated. The maggots live under the bark of the apple tree in Germany, Denmark, and Russia, the phenomena occurring in two species of Cecidomyidæ (*Maastor metroloas* and *Oligarces paradoxus*). Here also belongs the case of larval reproduction in *Amblystoma*.

Chrysallogenesis. This term is applied by Packard to a form of pædogenesis which occurs in the chrysalis of a gnât of the genus *Chironomus*. In 1869 Grimm discovered the pupa of a species of this gnât laying eggs. In autumn other pupæ changed to flies without laying eggs, while the fly was observed to deposit a larger number of eggs than the spring pupa. It is thus seen to be a seasonal phenomenon, dependent on the temperature. Grimm also found that, on removing from the perfectly developed insect before it has left the pupa case the eggs which otherwise would have been fertilized, and nurturing them in water, the development of the larvæ took place in them also, but lasted a little longer (about six days).

Metagenesis. This term was proposed by Owen in 1848 in his *Parthenogenesis* and afterward more fully in his *Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals* (London, 1858). His examples are the alternation of generations of the distomes, the hydroids, medusæ, and even the metamorphoses of the echinoderms, the gemmation of *Nais* and other annelids, as well as the metamorphoses of the fish lice (*Atheres*, etc.), which he says "is a slightly modified parthenogenesis"; again, he regards the phases they pass through as "much more those of a metagenesis than a metamorphosis." (See ALTERNATION OF GENERATIONS.) In his paper on the agamic

reproduction of *Aphis* Huxley employs the term "agamogenesis," which he says occurs "when the produced 'zoëid' is capable of development into an independent organism without the influence of an act of conjugation with another zoëid. The producing zoëid may be devoid of sexual organs, as in the Salpæ, many Hydrozoa, and many Trematoda," in fact in the great majority of cases of agamogenesis; and to this kind of alternation of generations he applies Owen's term "metagenesis," restricting the term "parthenogenesis" to cases where the parent "protozoëid" possesses sexual organs (ovaries), and its buds have all the histological characters of ova. Metagenesis is defined by R. Hertwig as "alternation of generations in the narrower sense." It is the alternation of at least two generations, of which one reproduces only asexually, by division or budding, the other either exclusively or at least to a great extent sexually. The first generation is called the "nurse"; the second, the "sexual animal." The best example is furnished by the mode of reproduction of Hydromedusæ. See HYDROZOA.

Heterogony. This differs from metagenesis by the fact that the asexual generation is replaced by parthenogenesis. For example, in certain Crustacea (Daphnidæ) only females occur in the summer time, which increase by unfertilized eggs. Then males appear for a short time, which fertilize the winter eggs which are now produced, from which again parthenogenetic generations arise (R. Hertwig).

Causes of Asexual Reproduction. Taking all these cases together, asexual reproduction of parthenogenesis in general is seen to be due to budding or cell division in the egg. The asexual aphids bud out from the ovary. It was for a long time held, says Hertwig, that the cells from which the cercariæ arose were not eggs, but "internal buds," "germinal granules." The fact seems to be that normal reproduction with growth and parthenogenesis are but extremes of a single series. The asexual mode of reproduction is most probably due to temperature and other changes in the conditions of life, as change of food and, in parasitic animals, change of host (Packard). The phenomenon takes place in the summer and in almost every case ceases at the approach of cold weather.

The case of dimorphism of a threadworm has been incorrectly regarded as heterogony, but it is simply due to changes of temperature. Thus, in low temperature filaria forms directly arise from the young of *Rhabdonema* (*Anguillula*) *intestinalis*; but in the summer heat indirectly forms a *Rhabditis* form. Wasman was able during three summers to induce parthenogenesis in the workers of *Formica sanguinea* and their slaves (*Formica pisca*) by artificially warming the nests. Abundant food favors parthenogenesis, though in *Phyllopera* the stoppage of the food supply induces parthenogenesis. See *Effects of Changes of Temperature under EVOLUTION*.

Artificial Parthenogenesis. Experiments by Herbst, R. Hertwig, T. H. Morgan, and especially by Loeb show that the unfertilized eggs of the sea urchin may be so stimulated by chemical solutions as to undergo the earlier phases of development. Herbst experimented with potassium chloride and lithium chloride, but found that while the larvæ developed they were monstrous and finally perished. Hertwig and also Morgan showed that if unfertilized eggs

be treated by weak solutions of sodium chloride, magnesium chloride, or strychnine, they exhibit some of the preparatory changes of yolk division and might actually divide, though without producing an embryo. Loeb finally succeeded in rearing large numbers of perfect larvæ from eggs which without fertilizing are first treated with a weak solution of magnesium chloride and then transferred to normal sea water. It thus appears that experiments carried out under rigidly controlled conditions show that the egg, without union with a sperm cell, is capable of complete development. In commenting on these discoveries E. B. Wilson (*International Monthly*, July, 1900) remarks that even in normal fertilization we must regard the stimulus to development as being given by a specific substance or substances carried by the spermatozoön. The experiments lead us to suppose that the chemical salts used "are individually poisonous to the egg, but are normally so balanced as to neutralize one another's injurious effects and maintain the equilibrium of the egg. If this armed neutrality be disturbed, the egg responds, undergoing degenerative changes and dying if the change be too violent, passing through an abnormal development and giving rise to monstrous embryos if the new conditions be less favorable, but under appropriate stimulus being, as it were, released from bondage and rendered free to run its normal course of development."

In Plants. Parthenogenesis has been observed at all levels in the plant kingdom, and the term is usually restricted to the production of a new individual by an unfertilized egg. One of the long-known cases among fungi is that of the water molds (*Saprolegnia*, q.v.), among which parthenogenesis is frequent and perhaps usual. All stages of abortion of the male apparatus have been observed, as, e.g., the fertilizing tube reaching the egg, but remaining closed; the tube reaching the wall of the oögonium, but not reaching the egg; the suppression of the fertilizing tube; or even the suppression of the antheridium. In all these cases the eggs behave as if fertilized and produce new plants. The ferns are notably parthenogenetic, the gametophyte (q.v.) under appropriate conditions not only producing sporophytes (q.v.) freely by vegetative apogamy, but also by parthenogenesis. Parthenogenesis has also been observed in several genera of angiosperms, the earliest recorded being *Antennaria*, *Alochemilla*, and *Thalictrum*. To these have been added *Taraxacum*, *Hieracium*, *Gnaphalium*, etc. It is a noteworthy fact that the majority of these genera belong to Compositæ, the ranking family of angiosperms. In most of these angiosperms the cytological situation has been investigated, and it has been discovered that parthenogenesis is associated with a failure of the reduction division, resulting in a diploid egg. Certain observations indicate also that these diploid eggs of angiosperms are incapable of fertilization. This raises the question whether the term "parthenogenesis" should not be restricted to the production of a new individual by a haploid egg, i.e., a normal egg, capable of fertilization. Among the ferns such eggs have been observed to produce new individuals, resulting in sporophytes with the half (haploid) number of chromosomes.

PARTHENON (Lat., from Gk. Παρθενών, from παρθένος, *parthenos*, virgin). A celebrated temple of the virgin goddess Athena, on the Acropolis of Athens. The highest triumph of Greek Doric architecture, it was the work of the architect Ictinus (q.v.), while the sculptures are generally believed to have been designed by Phidias (q.v.). The building was a Doric octostyle peripteros with 17 columns on the long sides. It was 100 by 225 Attic feet (about 101 by 228 English feet); from the top of the stylobate to the gable the height was about 59 feet. Behind the outer row of eight columns, at either end of the temple, are six columns, forming the fronts of the *pronaos* and the *opisthodomos*. The main hall of the temple called the *naos* or *hekatompēdos*, was 100 Attic feet in length and contained the great gold and ivory statue of Athena by Phidias. It was divided by two rows of columns into a central space and two narrow side aisles. These colonnades were each in two stories of superposed Doric columns and helped to support the wooden roof. Back of this was another room, entered from the *opisthodomos* only, and called the *parthenon*. In the building the most deli-

PLAN OF PARTHENON.

PARTHENON

1. METOPE—Centaur and Lapith, British Museum, London.

4. THE VARVAKEION STATUETTE, a copy of the Athena Parthenos, National Museum, Athens.

cate refinements were introduced in order to correct optical distortions. The lines of the stylobate, cornice, and columns were delicately curved, though with such nicety that often the curvature can be detected only by the most careful sighting or measurement. That these refinements were carefully calculated from the start is shown by the cutting of the rock on which the crepidoma rests to allow of the proper curvature in the lines of the stylobate. These interesting facts were first observed in 1814 by Allason, and later by Cockerell and Pennethorne (q.v.), published to the world in 1838 by Hoffer, and after careful reinvestigation elaborated by F. C. Penrose, in his *Principles of Athenian Architecture* (London, new ed., 1888). (See REFINEMENTS OF ARCHITECTURE.) The whole building was of carefully selected white Pentelic marble, with the exception of the tiles of the roof, for which Parian marble was employed. (See Colored Plate under ARCHITECTURE. For a brief discussion of the question of the internal lighting of the naos and statue, see TEMPLE.) Begun about 447 B.C., the temple was sufficiently completed to permit the installation of the statue in 438 B.C. It continued in use till the end of the fifth or possibly the sixth century of our era, when it was transformed into a Christian church, dedicated at first to the Divine Wisdom and later to the Virgin. After the capture of Athens by the Turks (1458 A.D.), it became a mosque, and a minaret was built in the southwest corner. It was, however, but little damaged, and in 1674 the sculptures were drawn by Jacques Carrey and other artists in the suite of the Marquis de Nointel. In 1687, during the siege of Athens by the Venetians, the Turks used it as a powder magazine, and on September 26 a Venetian bomb fell through the roof, causing an explosion which killed 300 persons and completely destroyed the central portion of the building. Early in the nineteenth century Lord Elgin secured permission to remove the sculptures to London. (See ELGIN MARBLES.) Apart from its value in the history of architecture, the Parthenon is of the greatest importance for the history of Greek sculpture. The two pediments were filled with colossal sculptures in the round, those in the east representing the birth of Athena from the head of Zeus and those in the west the contest of Athena and Poseidon over Attica. The 92 metopes, all of which were sculptured, represented, at the east end, the struggle between the gods and the giants and, at the west end, that between the Athenians and Amazons. On the south side was the battle between the Centaurs and the Lapithæ and on the north the capture of Troy and the victory over the Persians. But the great glory of the temple was the long frieze which ran entirely around the outer wall of the cella and over the columns at either end, wrought in low relief in the most perfect style of the noble art of the fifth century. It represented the great Panathenaic procession, in which all classes of Athenians assembled to do honor to the goddess. (See PANATHENÆA.) The effect of the sculptures and architecture was enhanced by the use of color and metal to bring out the details. The metopes show marked stylistic differences, both in design and execution, and cannot all be attributed to the mind of a single artist, nor can it be supposed that the other sculptures were the work of a single hand, though they seem to most critics to

show the influence of one master mind. They are characterized by a severe simplicity, scorning anything that savors of sensationalism or prettiness, but full of life and vigor in the animation of the frieze, of calm dignity in the figures of the gods, and everywhere marked by harmony and beauty in the lines and almost perfect technical skill in the treatment of the material.

PARTHENOPE, pār-thén'ô-pé (Lat., from Gk. Παρθενώμη). 1. The daughter of Stymphalus, beloved by Hercules. 2. A siren who drowned herself for love of Ulysses. She was cast up by the sea at Naples, which was named for her.

PAR'THENOPE'AN REPUBLIC (from *Parthenope*, the ancient name of the city of Naples). The name given to the state into which the Kingdom of Naples was transformed by the French Republicans, Jan. 23, 1799. It lasted only until the following June, when the invading army was forced to retreat.

PAR'THIA (Lat., from Gk. Παρθία, *Parthia*, from Παρθῆναι, *Parthênai*, Παρθῆναι, *Parthênai*, Παρθοί, *Parthoi*, Parthians). An ancient empire founded out of part of the old Persian Empire, lying to the southeast of the Caspian Sea (Map: Rome, G 3). The original inhabitants were probably of Turanian stock, related to the great tribes of Central Asia, whence have come the Huns, Mongols, Turks, and Magyars. The Parthians were distinguished by primitive simplicity of life and extreme bravery, though at the same time they were much given to bacchanalian and voluptuous pleasures. They neglected agriculture and commerce, devoting their whole time to predatory expeditions and warfare. They fought on horseback and after a peculiar fashion. Being armed solely with bows and arrows, they were rendered defenseless after the first discharge and, to gain time for adjusting a second arrow to the bow, turned their horses and retired, as if in full flight, but an enemy incautiously pursuing was immediately assailed by a second flight of arrows; a second pretended flight followed, and the conflict was thus carried on till the Parthians gained the victory or exhausted their quivers. They generally discharged their arrows backward, holding the bow behind the shoulder, a mode of attack more dangerous to a pursuing enemy than to one in order of battle. They were conquered by Cyrus in the sixth century before Christ, and their country was organized into a satrapy under Darius. Parthia was included in the conquests of Alexander the Great and after his death formed a part of the Seleucid Syrian Kingdom until about 250 B.C., when the people revolted successfully under Arsaces, founder of the dynasty of the

Arsacidae (q.v.), who maintained a most tyrannical despotism. The capital of the Parthian monarchy was Hecatompylos (the city of the hundred gates). The dominion of Parthia rapidly extended to the Euphrates and the Indus, and Parthia became a most powerful and flourishing empire; Seleucia, Ctesiphon—the capital of the Persian emperors of the Sassanidae—and other celebrated cities date their rise from this period and soon eclipsed in size and splendor the ancient Hecatompylos. In spite of repeated attacks on the part of the Romans the Parthians maintained their independence (see CRASSUS, MARCUS; ANTONIUS, MARCUS [Mark Antony]; AUGUSTUS); and though Trajan in 115–117 A.D. seized certain portions of the country, the Romans were soon compelled to abandon them. In 165, however, the Romans took from Parthia considerable territory. The final struggle with Rome took place in 217, when a desperate drawn battle at Nisibis made both parties desirous of peace. The Parthian Kingdom was then weakened by dissension, and in 226, during the reign of Artabanus IV, the last of the Arsacidae, a revolt headed by Ardashir, son of Babegan, broke out in Persia, and the Parthian monarch, beaten in three engagements, lost his throne and life, the Persian dynasty of the Sassanidae (q.v.) taking the place of the Arsacidae. Some scions of the Parthian royal family continued for several centuries to rule over the mountainous district of Armenia, under the protection of the Romans, and made frequent descents upon Assyria and Babylonia; but their history is obscure and of little importance. Consult: George Rawlinson, *The Sixth Great Oriental Monarchy* (New York, 1873); Percy Gardner, *The Parthian Coinage* (London, 1877); A. von Gutschmid, *Geschichte Irans und seine Nachbarländer von Alexander dem Grossen bis zum Untergang der Arsaciden* (1888); George Rawlinson, *Parthia*, in "Story of the Nations Series" (New York, 1899); Warwick Wroth, *Catalogue of the Coins of Parthia in the British Museum* (London, 1903); Petrowicz, *Arsakidenmünzen* (Vienna, 1904).

PARTIAL TONES. See CLANG TINT; HARMONICS.

PAR/TICEPS CRIM'INIS (Lat., a partaker in a wrong). In law, one who shares in the guilt of a wrongful act, whether civil or criminal. In the law of civil liability such a person has no right of recovery against his partner in wrongdoing for any injury suffered by him through the latter's fault. The courts will refuse to lend their aid either to divide the spoil or to equalize the burdens of wrongdoing. A gambler cannot recover from a fellow gambler who has cheated him. A person who has given a bond or deed to compound a felony is not entitled to have the instrument canceled either on the ground of its illegal object or because it was obtained from him by duress. If one of two joint wrongdoers is mulcted in damages, he cannot have contribution from his fellow wrongdoer. The burden lies where it falls. In the criminal law a *particeps criminis* is punishable as an abettor (see ABET, ABETTOR) or an accessory (q.v.).

PARTICIPLE (Fr. *participe*, Lat. *participium*, participle, a sharing, from *particeps*, partaking, from *pars*, part + *capere*, to take). In grammar, a word partaking of the characteristics of a verb and an adjective. Like the verb, it governs nouns or pronouns, and, like the adjective, it agrees in gender, number, and case with

the noun or pronoun which it modifies. The double function of the participle is illustrated in such sentences as *μνήσμαι αὐτὸν τοῦτο ποιῆσαντα* (I remember him doing this); *Flaminius restitit agrum dividendi* (he resisted Flaminius dividing the territory). Participles are either active or passive and are of various tenses, as present, past (aorist), perfect, and future. In English the active participle coincides in form with the abstract verbal noun, as, *going*. The two forms must be sharply distinguished in speech, as, *he is building the house*, but, *forty and six years was this temple in building* (whence such colloquial and archaic forms as *a-building*). There are only two classes of participles in English, the present and the past or passive, thus, *making, made; loving, loved*. The line of demarcation between the participle and the adjective is often difficult to distinguish, as they merge into one another. See GRAMMAR, *Bibliography*.

PAR/TICK. A municipal and police burgh of Lanarkshire, Scotland, on the north bank of the river Clyde. It is a western suburb of Glasgow, has numerous shipbuilding yards, and 1500 feet of wharfage along the Kelvin River. It manufactures paper, flour, and machinery. Pop., 1901, 54,274; 1911, 66,849.

PARTICULAR BAPTISTS. See BAPTISTS.

PARTICULAR ESTATE. In the common law of real property, any estate in possession, less than a fee simple. Thus, if lands are given to J. D. for life or in fee tail, and, on J. D.'s death or the failure of issue to J. S., in fee simple, J. D. is said to be seised of a particular estate (Lat. *particula*, small part) and J. S. of the remainder. J. D. is the particular tenant, J. S. the remainderman. The particular tenant, being in possession, had the power, by making livery of seisin, to convey a greater estate than he himself had and thus to disseise his remainderman. This was known as a tortious (wrongful) conveyance. It has been rendered impossible by statute both in England and in this country, a conveyance by whatever method now having the effect of conveying only such estate as the grantor has to convey. See DISSEISIN; ESTATE; REAL PROPERTY.

PARTICULARS, BILL OF. In English and American law, a statement of the items constituting a claim or allegation set up in a declaration of complaint or in a set-off or counterclaim. A party to a suit against whom such a claim or allegation is made may demand a bill of particulars in any case where the cause of complaint alleged is too general or indefinite to enable him to make his defense. The object of the procedure is to enable parties to go to trial with an understanding of the case they have to meet and thus to save expense and to prevent them from being taken by surprise. Under the reformed procedure both in England and the United States a party entitled to particulars may demand a bill, or statement, from his opponent and, if the demand is not complied with, may obtain an order of the court directing that the bill be delivered.

A party is bound by his statement of particulars just as though it had been embodied in his original statement of claim, though the court may in its discretion permit it to be amended.

It is impossible to lay down a general rule as to the kinds of particulars that may properly be demanded. Generally, whenever a lump sum

is claimed to be due, as for professional or other services, the party against whom the claim is made may demand a statement of the items constituting the claim. In divorce suits for adultery or cruel and inhuman treatment bills of particulars specifying the acts of adultery or of cruelty alleged have been ordered. So in a complaint for damages resulting from negligence the defendant is entitled to a statement of the items of damage as well as of the acts of negligence on which the claim is based. See PLEADING.

PARTIES. In law, in a general sense, those who have personal connection with an affair or transaction, or who are united in interest in any act or thing, as parties to a contract or a deed; in a specific sense, litigants in a legal action or proceeding. In cases in equity all persons who have a material interest in the subject matter of the proceeding, whether legal or equitable, must be made parties, and persons whose interests are antagonistic cannot be joined as complainants. In an action at law there are generally two parties, or classes of parties—the plaintiff, or complainant, and the defendant—but variations occur, as in attachment cases, in actions in rem, etc. In general, any person not under legal disability of some kind, such as an alien enemy, an idiot, or an infant, may become a party plaintiff or may be made a party defendant. For such persons as are under legal disability of any kind the law appoints or allows others to act for them, either in their names or on their behalf. Consult: DICEY, *Treatise on the Rules for Selection of Parties, etc.* (Jersey City, 1886); BARBOUR, *Summary of the Law of Parties to Actions, etc.* (Albany, 1884); and the authorities referred to under PLEADING; EQUITY; LAW; ETC. See also ACTION; ALIEN; DEFENDANT; INFANT; INSANITY; PLAINTIFF.

PARTING. See CLEAVAGE OF CRYSTALS; ASSAYING; GOLD; REFINING OF METALS; SILVER.

PARTINGTON, MRS. A character similar to Mrs. Malaprop in her wrong use of words. Its origin was probably the person of that name described by Sydney Smith in a speech on the position of the House of Lords in reference to the Reform Bill, as attempting to keep back the Atlantic Ocean with her mop.

PARTINICO, pàrt'e-nē'kò. A town in the Province of Palermo, Sicily, 14 miles west-southwest of Palermo (Map: Italy, D 5). Corn and fruit are produced in the vicinity, and there are manufactures of wine, oil, linen, and woolen goods. Pop., 1901, 23,729; 1911, 21,656.

PARTITION (Lat. *partitio*, division, from *partiri*, to divide, from *pars*, part). A division of real property or of goods and chattels among persons who have an undivided common interest in them so that each becomes the sole owner of a definite part or portion of the property. Compulsory partition was first allowed in the early common law as to coparceners, who became common owners of real estate by inheritance, on the theory that, as they became such owners by operation of law and without their consent, they should be entitled to have the property divided among them. But as estates held in joint tenancy and tenancy in common were ordinarily created by the voluntary act of the parties or with their consent, the old rule was that the estates could be dissolved only by common consent. In the course of time, however, the common-law rules were changed by statute, and since the reign of Henry VIII all estates

held jointly or in common have been subjected to compulsory partition. The English law as modified by statute has been adopted as the common law of the United States.

Originally, compulsory partition was obtained by means of a writ of partition, issued from a court of law, but subsequently the courts of chancery assumed jurisdiction; and in most American States the action is now considered more in the nature of an equitable action because of the character of the relief obtained. Compulsory partition is now confined almost exclusively to real estate, as personal property, when left by a decedent, is sold and the proceeds distributed by the executors or administrators; and it is seldom held in common except by virtue of a partnership relation, in case of the dissolution of which the sale of the property, or an accounting, is resorted to as the most convenient method of adjusting the rights of the partners.

Where the common owners of property agree upon a partition, it is usually effected by exchanging deeds, each conveying and releasing to the other all his right, title, and interest in and to the portion which the grantee is to receive. It is held in some States that a parol partition followed by actual possession of the respective portions of the parties is valid, on the ground that a conveyance is not necessary under the Statute of Frauds, as each party owned every portion in common with the others, but this is a most doubtful and unsatisfactory method.

Where the parties do not all agree that there should be a partition, and upon the shares to which each should be entitled, one or more of them may commence an action for partition. All parties having any possible interest in the property who do not join as plaintiffs should be made parties defendant. In some cases where the owners in common are all friendly, it is agreed that partition shall be made by the court, and one or more will consent to be made parties defendant, in order to give the proceeding the form of a litigated action. A few States permit all the parties in interest to join in an ex parte application to the court for partition, i.e., to apply by a petition in the name of all, no one being made party defendant. In all such "friendly" suits the costs are apportioned among the parties according to their respective interests.

The respective proportions or interests of the various parties are first determined, and the court then decides upon the division which will be equitable and just to all. The courts generally favor a division of the property itself where that is possible from its nature and situation. In some cases the courts may make a division of real estate among the interested parties and order those who receive parcels of greater value than the others to make a certain compensation to the latter. This is sometimes called "owelty (equality) of partition." In the actual division and apportionment of lands values of the respective portions are considered as well as area, and where the action is brought in a court of equitable jurisdiction each party will be allotted the portion which seems best adapted to his interests. A partition sale is conducted on the same principles as any other judicial sale. See JOINT TENANCY; REAL PROPERTY; TENANCY IN COMMON. Consult the authorities referred to under EQUITY; REAL PROPERTY.

PART MUSIC, or PART SONG. A com-

position for at least three voices, generally without instrumental accompaniment. The voices may be equal (all male or all female) or mixed

PARTNERSHIP (ME. *partener*, *parcener*, OF. *parcener*, from ML. *partionarius*, having a portion, from Lat. *partitio*, division) An unincorporated association of two or more persons carrying on a lawful trade or business with a view to profit. The term was formerly employed in a looser sense to designate any association of adventurers in a common enterprise, and it is in popular speech sometimes still employed of persons associated in a corporation or as part owners. But in the legal sense neither of these forms of combined or associated action is a partnership. As the relation is a peculiar one, vesting extensive powers in the members thereof and imposing on them an extraordinary responsibility for one another's acts, it is important to distinguish the partnership from other forms of association.

Test of Partnership. Ordinarily this is not a difficult thing to do. First, we inquire whether the association is a voluntary one, for the law does not institute the relation of partners between persons against their will. Property may be left to children by a parent. This does not make them partners. Each has a right to say whether or not he will combine his interest with the interests of the others in carrying on a common business. It follows from this necessity of a binding agreement between the parties that they must possess legal capacity to contract and that the partnership agreement must be of such nature and form as to be legally enforceable. An infant is not bound by a partnership contract. Convicts, alien enemies, and, as a rule, corporations are prohibited from entering partnerships. At common law married women were incapable of binding themselves by contract and consequently could not become partners, though this disability has now generally been removed by statute in whole or in part. Even when the parties have contractual capacity, their partnership contract may be worthless, either because its object is against public policy or otherwise illegal or because its form does not comply with the Statute of Frauds. Courts have properly refused to enforce partnership agreements for highway robbery, for conducting gambling establishments or houses of ill fame, for cornering markets, and for creating illegal monopolies.

The second question to ask is whether the parties are carrying on a business in common. A landowner often lets his premises to a tenant to farm on shares. This arrangement does not make them partners. Owners in common of a building agree that one of them shall have the general management of it and provide funds for necessary repairs, so as to make it habitable by tenants, and to divide the rent. Such an agreement does not amount to a partnership. If, however, they agree to supply the building with furniture at their joint expense, and to let furnished rooms to various tenants, they may well be held to intend the carrying on of a business in common. While it is possible and even common for partnerships to exist for buying and selling real estate or for renting it, the courts usually require that the intent of joint owners to throw such property into a fund as partnership stock shall be distinctly manifested.

Still a third question to be answered before a decision as to the partnership character of an association can be reached is whether it was entered into with a view of profit. The earliest form of partnership known to English law was that of ordinary merchants. Its sole object was pecuniary gain. Hence the courts of England and of this country have had no hesitation in declaring that "societies and clubs, organized and maintained for the promotion of temperance, for the enforcement of particular laws, for musical culture among their members, for the propagation of political, social, or religious doctrines, or even for mutual protection or insurance, are not partnerships, even though they may have for one of their objects the accumulation of property to be owned and enjoyed in common."

Formerly the right to share in the profits of a business was thought to constitute one a partner, whether he was a coowner in the enterprise or not. This view has been discarded in England and in most American States. A person may share the profits, as a servant or agent, as a lender of money, or as the lessor of property, without becoming a partner. Sharing the profits of a business is *prima facie* evidence that one is a partner, but it is no longer deemed conclusive. It may be overcome by evidence that the sharers are not carrying on the business in common—that they are not its joint proprietors.

Classes of Partnership. Various classifications have been made by writers and judges. A general partnership is one organized for the conduct of a business in accordance with the general usages of trade. A particular partnership is confined to a single transaction or enterprise. Joint-stock companies are a form of general partnership at common law, in which the members are allowed to transfer their shares without dissolving the firm, and the control of which is vested in a few designated managers. All of these forms are again classified as ordinary partnerships, in contradistinction to limited partnerships.

The limited partnership was introduced into the United States about the middle of the last century from the law of France. It was much slower in gaining a foothold in England, although strenuous efforts were made to develop it there after it had proved successful in America. It was not till 1907 that it secured recognition in that country through the enactment by Parliament of the Limited Partnership Act (7 Edw VII, c 24). New York was the first of the United States to provide by legislation for limited partnerships. This example was promptly followed by Connecticut, and now nearly every State has a statute upon the subject. The distinctive characteristic of a limited partnership is the conjunction of at least one general partner, who is liable for all the debts of the firm, as every member of an ordinary partnership is, with one or more special partners, whose liability is limited to their contribution to the capital of the firm. In a few States limited partnership associations are authorized. These differ from the regular limited partnership in that their capital alone is responsible for their debts, none of the partners is subject to any personal liability. Both of these institutions, it will be observed, are creatures of statute. Accordingly, if the statutory provisions are not complied with, all the mem-

bers of the association are liable as general partners. The chief requirements are these: a certificate must be signed, acknowledged, registered, and published by the partners, stating the name under which the partnership is to be conducted, the general nature of the business to be done, the names and residences of the various members with a designation of the general and of the special partners respectively, the amount of capital contributed by the special partners, and the times at which the partnership is to begin and to end. An affidavit must also be made and filed with the certificate, stating that the sums specified in the certificate to have been contributed by the special partners have been actually and in good faith paid in cash. In some States the capital of the special partners may be contributed in property other than cash. See *SOCIÉTÉ EN COMMANDITE*.

In addition to the two kinds of partners designated by limited partnership legislation, the general partner and the special partner, we have three others, which must be briefly described. An active or ostensible partner is one who frankly avows his membership in the firm and actively and openly promotes its business. A dormant partner is one who conceals from the public his connection with the firm. In England and in a few of the United States he may take part in the conduct of firm affairs without losing his status, but the view prevailing generally in America is that he must take no part in the business—that both secrecy and inactivity are included in the term “dormant.” The third kind goes under various names. Sometimes he is called the nominal partner, at others the holding-out partner. Still again he is described as the quasi partner, or partner by estoppel. Each of these designations indicates that he is not a partner at all, but that he is nevertheless liable, as if he were a partner, to those persons who have acted upon his representations that he was a partner and who would suffer loss if he were permitted to repudiate the relation asserted by him.

Nature of Partnership. After a partnership has been formed the association is generally spoken of as a firm, and the name in which it does business is called the firm name. Unless forbidden by statute, the firm may adopt any name it pleases and may change it at will, or it may go without a name. Occasionally the Legislature prohibits the use of the words “and company” or “& Co.” unless such terms represent an actual partner, or it forbids the assumption of a corporate name. Even in the absence of a statute a partnership is not at liberty to choose a firm name which will operate as a fraud upon the public or upon others trading under substantially the same name.

The law merchant treats the firm as a legal entity—as a sort of artificial person much like a corporation. When the partners make their contribution to firm capital they cease to own it as individuals and title passes to the firm. The firm becomes their debtor for the capital. They lend money to the firm or borrow from it. The firm, in other words, has its own property, its own creditors, and its own debtors. This conception of the firm prevails very generally among the mercantile classes both in England and in the United States. It is always observed by partnership bookkeepers. To some extent it has been recognized by State and Federal statutes, permitting the firm to sue and be sued as

an association and to be declared a bankrupt. The entity theory of partnership, however, has never received full judicial sanction by English or American courts. And American judges, who in construing mercantile contracts have given effect as far as possible to the mercantile conception of partnership, have declared “that the firm is not recognized by lawyers as distinct from the members composing it.” It follows from this view that if lands are purchased by a firm, the deed should name the partners as grantees, and if the partnership sells lands, the deed should name the partners as grantors, and they and their wives should execute and acknowledge the conveyance precisely as though they were tenants in common of the property.

But this conception of a firm as a mere association of individuals is not applied consistently in any jurisdiction. For example, we have said that an infant, because of his contractual incapacity, is not bound by his agreement to become a partner nor by the partnership agreement with third persons. Yet, after he has entered a firm and taken part in its management, he is not allowed to withdraw his capital until firm debts are paid. That is, he may escape personal responsibility for partnership obligations, but the firm ownership of firm property prevents his taking away any money or goods which he had contributed to the firm. Again, a partner's share in the firm is not the interest of a tenant in common in specific articles. It is only a chose in action, a right to his proportionate share of the net proceeds of firm property upon a final settlement.

Powers of Partners. Each member of a normal partnership is the general agent of the firm and of his copartners in carrying on the ordinary business of the firm. He can sell and give a perfect title to firm property, can collect debts, and can subject the firm and his copartners to most extensive obligations both in contract and in tort.

How extensive a general partner's agency is depends upon the nature of the firm's business. His implied authority may be summarized as follows: if the partnership is a trading or commercial firm, he may sell or pledge any of its personal property; he may buy on credit such property as it is accustomed to deal in; he may borrow money and issue in the firm name negotiable paper; he may hire servants and agents; and he may render the firm and each copartner liable in tort by wrongful acts or omissions in the ordinary course of the business of the firm. Moreover, his admissions and representations made concerning the firm affairs and in the ordinary course of its business are receivable as evidence against the firm and his copartners when sued as such.

This implied agency of a partner may be withdrawn from him by his consent, as where the partnership articles confer the power of management upon particular members. It may be taken from him without his assent by a majority acting in good faith. Such limitations upon a partner's agency must, however, be brought to the knowledge of those dealing with the firm, or they will not be affected by them.

Duties of a Partner. The most important of these is his observance of the utmost good faith towards his copartners. Not only must he give the firm the benefit of every advantageous bargain he can make in the business, but he must

devote the whole of his time and energies during business hours to the promotion of its interests, unless the partnership contract otherwise provides. Moreover, if his copartners have been compelled to pay more than their shares of the firm debts and expenses, he is bound to contribute towards their indemnity.

Dissolution of Partnership. This may result by operation of law, or from the acts of the parties, or from judicial decree. The happening of any event which makes it unlawful for the business of the firm to be carried on, or for the particular contracting members to continue as partners, dissolves the firm at once, as does the death or the bankruptcy of a partner. The partnership may terminate by reason of an agreement made in advance that it shall continue for a fixed time, or it may be terminated at any time by mutual consent. Generally one partner may break up a firm against the wishes of his copartners, subject to his liability to damages for breach of his partnership contract.

A court will ordinarily decree a dissolution, at the request of a partner, upon the insanity or permanent incapacity of a member of a firm, or for the misconduct of one of the defendant partners, or when it appears that the business can only be carried on at a loss. As soon as a firm is dissolved the agency of the partners ceases, except so far as this is necessary for the purpose of winding up the firm's affairs. Sometimes a particular member is agreed upon as liquidating partner, to whom exclusive authority in settling firm matters is confided.

In winding up a partnership its assets are to be applied as follows: first, to paying the general creditors of the firm; second, to paying to each partner ratably what is due from the firm to him for advances as distinguished from capital; third, paying to each partner ratably what is due from the firm to him in respect of capital; fourth, the distribution of the residue, if any, shall be among the partners in the proportion in which profits are divided. If losses have been sustained these are to be paid first out of profits, next out of capital, and lastly, if necessary, by the partners individually in the proportion in which they were entitled to share profits. Of course, these rules may be varied, so far as their application to partners is concerned, by provisions in the partnership articles.

The law of partnership has to a large extent been codified in England by the Partnership Act (53 and 54 Vict., c. 39), which went into effect Jan. 1. 1891.

Consult: Theophilus Parsons, *A Treatise on the Law of Partnership* (4th ed., Boston, 1893); N. L. Lindley, *The Law of Partnership* (7th ed., Toronto, 1905); F. M. Burdick, *The Law of Partnership, Including Limited Partnerships* (2d ed., Boston, 1906); Frederick Pollock, *Digest of the Law of Partnership* (9th ed., London, 1909).

PARTON, ARTHUR (1842-1914). An American landscape painter, born at Hudson, N. Y. He was a pupil of W. T. Richards in Philadelphia and was elected to the National Academy in 1884. The coloring in his landscapes is usually in a low key, but his later work, with quite as much quality, has more vigor. His pictures include: "Palisades in Winter" (1885); "Misty Morning" (Brooklyn Institute); "Loch Lomond" (Art Association, Indianapolis); "Night in the Catskills" and "Evening—Harlem River" (both in the Metro-

politan Museum, New York); "The Ledge" (1913); "A Spring Morning" (1914).

His brother and pupil, **ERNEST** (1845-), born at Hudson, also became known as a landscape painter. He resided in England after 1873. His paintings are simple in motive and combine refinement of tone with incisiveness of detail. Among the best known are "Waning of the Year" (Tate Gallery) and "Woodland Home" (Walker Gallery, Liverpool).

PARTON, JAMES (1822-91). An American author, born in Canterbury, England, Feb. 9, 1822. Parton was brought to the United States in 1827 and was educated in New York City and White Plains, N. Y. He taught in Philadelphia and New York and began a long literary career by journalistic work on the *Home Journal*. His first book was a *Life of Horace Greeley* (1855), which gained immediate success. He afterward devoted himself wholly to authorship and to lectures on political and literary topics, residing in New York until 1875 and afterward at Newburyport, Mass. His principal publications were: *Life and Times of Aaron Burr* (1857); *Life of Andrew Jackson* (3 vols., 1859-60); *General Butler in New Orleans* (1863); *Life and Times of Benjamin Franklin* (1864); *Famous Americans of Recent Times* (1867); *The Words of Washington* (1872); *Fanny Fern* (1873), a memorial to his wife; *Life of Thomas Jefferson* (1874); *Caricature and Other Comic Art in All Times and Many Lands* (1877); *A Life of Voltaire* (1881), his most meritorious production; *Noted Women of Europe and America* (1883); *Captains of Industry: A Book for Young Americans* (1884, 1891). In 1856 he married Sara Payson Willis (born at Portland, Me., July 9, 1811; died at Brooklyn, N. Y., Oct. 10, 1872), sister of the poet N. P. Willis, a popular authoress who wrote under the name of Fanny Fern. She left, by a former marriage to Charles H. Eldridge, a daughter, whom Parton afterward married.

PART OWNER. In its broadest sense, any person who owns property in common with another or others, except partners. Specifically, one of the coowners of a ship. Part ownership is not a partnership, even though the ship is operated for the common profit of the owners. They do not as such owners usually carry on a business in common. A partnership involves the notion of common and active participation in the management of an enterprise. Part owners may, indeed, transform this ownership into a partnership by agreement. Such transformation, however, will not be presumed; it must be proved. So long as they remain part owners they manage the vessel by, and delegate their interests to, various agents, of whom the principal are the ship's husband and the master. Formerly the ship's husband was generally in fact a part owner, but he need not own an interest in the vessel in order that his authority shall extend to all matters connected with its equipment, repair, and management. A majority of the part owners have the right to use the ship for a particular voyage against the will of the minority. When the majority exercise this power, however, a court of admiralty may require them to secure the minority owners to the extent of their shares. Consult James Kent, *Commentaries on American Law* (14th ed., Boston, 1896), and N. L. Lindley, *The Law of Partnership* (7th ed., Toronto, 1905). See **PARTNERSHIP**.

PARTRIDGE (OF. *perdris*, *perdris*, *pertrix*, Fr. *perdriz*, It. *perdice*, *pernice*, from Lat. *perdix*, from Gk. *πέδιξ*, partridge). A popular name for various gallinaceous birds, or other birds superficially like them, the precise application of which depends not only on the country but also on the part of the country where the term is used. The name was originally given, and properly belongs, to birds of the grouse family, of the genus *Perdix*, all of which are confined to the Old World. They have a short, strong bill, naked at the base; the upper mandible convex, bent down at the tip, the wings and tail short, the tarsi as well as the toes naked, the tarsi not spurred. In North America the term is hardly applicable properly, as our larger Gallinæ are grouse, while the smaller ones are preferably known as quails, although not precisely the same as the true quails (*Coturnix*) of the Old World. In the northeastern United States the ruffed grouse (see GROUSE) is almost universally called partridge, while in the Southern States the common quail (q.v.) receives that name and the grouse is known as pheasant. The term seems most properly applied in America to the small game birds of the Pacific coast, such as Gambel's partridge, and the mountain and valley partridges of California. In South America tinamous (q.v.) are called partridges.

The true partridge of the Old World is typified by the common gray partridge (*Perdix perdix*, or *cinerea*) of Great Britain and Europe generally, which is the most plentiful of all the game birds in Great Britain and becomes increasingly plentiful as cultivation is extended. On the continent of Europe it is abundant in almost all suitable districts from Scandinavia to the Mediterranean, and is found also in the north of Africa and in western Asia. It varies considerably in size, those found in rich lowlands are generally the largest and about 12½ inches in entire length, while those which inhabit poorer and more upland districts are rather smaller. The female is somewhat smaller than the male. The upper parts of both are ash gray, finely varied with brown and black, the male has a deep chestnut crescent-shaped spot on the breast which is almost or altogether wanting in the female. The partridge is seldom found far from cultivated land. It feeds on grain and other seeds, insects and their larvæ and pupæ, and the pupæ of ants are generally the food sought at first for the young. The nest is usually on the ground, among brushwood and long grass, or in fields of clover or corn, and generally contains from 12 to 20 eggs. Until the end of autumn the parent birds and their brood keep together in a covey; late in the season several coveys often unite into a pack, when it becomes much more difficult for the sportsman to approach them. The flight of the partridge is strong and rapid for a short distance, but the bird does not seem to be capable of long-sustained flight. The eggs of partridges are often hatched, and the young birds reared, by the domestic hen, the chief requisite being a plentiful supply of ants when the birds are very young. Partridges thus reared become very tame, but they seldom breed in the aviary. Other species occur in Asia.

Of a different genus is the red-legged or French partridge (*Caccabus rufa*), a native of southern Europe and now plentiful in the south of England, where it has been introduced. It

is rather larger than the common partridge, stronger on the wing, and less easily approached by the sportsman, while it is also less esteemed for the table. The upper parts are of a reddish ash color; the throat and cheeks white, bounded by a collar of black, which expands in black spots on the breast; and the sides exhibit bars of black. The plumage is smooth. Two other species nearly allied to this are found in southern Europe. India has a number of species, the habits of which much resemble those of the common partridge, the best known of which is the chukor (q.v.). In India, however, the name is extended by sportsmen to a large variety of small game birds, more or less like the true partridge, such as the bamboo partridges, hill partridges, and francolins (of which the black partridge, *Francolinus francolinus*, of the eastern Mediterranean region is a familiar example). In Australia one of the bush quails (*Pedionomus*) is so called, and in South Africa the redwing partridge of the colonists is a francolin (*Francolinus leuallanti*).

Y., 1915), and writings of American naturalists and sportsmen generally. See Colored Plates of GAME BIRDS with article GROUSE and of EGGS OF WATER AND GAME BIRDS.

PARTRIDGE, ALDEN (1785-1854). An American educator, born at Norwich, Vt. He graduated at the newly founded Military Academy at West Point in 1806, was commissioned first lieutenant of engineers, and was assigned to duty there as assistant professor of mathematics. From 1813 to 1816 he was professor of engineering. In 1818 he resigned from the army and in 1820 returned to Norwich, where he founded the American Literary, Scientific, and Military Academy better known as the Norwich Military Academy. The success of this undertaking was immediate, and in 1834 the State granted it a charter as the Norwich University. At the invitation of other States Partridge founded similar military schools at Portsmouth, Va., Pembroke, N. H., Harrisburg, Pa., and Brandywine Springs, Del., and devoted much time to organizing and drilling their militia.

PARTRIDGE, BERNARD (1861-) An English caricaturist and illustrator. Born in London and educated at Stonyhurst College, he was first employed in an architect's office, then by a firm of stained-glass designers, and from 1880 to 1884 worked at church decoration under Philip Westlake. After trying the stage he at last found his true vocation as an illustrator and cartoonist. In 1892 he joined the staff of *Punch*, of which he later became the

principal cartoonist, making his mark instantly with his illustrations for Anstey's serials *Voces Populi* and *The Man from Blankley's* and with a series of clever society sketches. Partridge's work shows great facility, spontaneity, and power of rendering expression. Though his execution is sometimes scratchy his draftsmanship is good and his portraiture truthful. He also painted occasionally in oil and water color, and worked in pastel.

PARTRIDGE, JOHN (1644-1715). A London astrologer and almanac maker. Bound apprentice to a shoemaker, he nevertheless learned by himself Latin, Greek, and Hebrew, and seems subsequently to have studied medicine at Leyden. He wrote a treatise on the *Old Principles of Astrology* in 1697. In 1680 he had begun to issue an almanac called *Merlinus Liberatus*, which, after a short suspension, was regularly published from 1689. This masterpiece of equivocation soon became exceedingly popular. As a parody upon it Jonathan Swift issued at the beginning of 1708 *Predictions . . . by Isaac Bickerstaff, Esq.*, in which it was foretold that Partridge would "infallibly die upon March 29 next, about 11 at night, of a raging fever." On March 30 Swift published a pamphlet in which the prediction was said to be accomplished. In vain Partridge spent the rest of his life in trying to convince the public that he was still alive. Swift followed up the humorous attack in an *Elegy on the Death of Mr. Partridge* (1708) and the *Vindication of Isaac Bickerstaff* (1709). Partridge was so completely crushed that not another *Merlinus* appeared till 1714. Partridge's *Almanac*, issued by the Stationers' Company in 1711, appeared regularly at least until the last decade of the nineteenth century. The name Isaac Bickerstaff (q.v.), which Swift took from a sign in Longacre, soon spread far and wide. It was appropriated by Steele in the *Tatler* (1709).

PARTRIDGE, WILLIAM ORDWAY (1861-). An American sculptor and author, born in Paris. He attended Columbia University in 1885, and studied modeling in Paris, then under Galli in Florence and Welonski in Rome. He first became known by his well-characterized portrait busts. One of his first large works, the bronze statue of Hamilton, in Brooklyn, N. Y., is a striking conception of the great statesman in a moment of dramatic interest. Other notable statues are: Shakespeare, unveiled at Lincoln Park, Chicago, in 1894; the bronze equestrian statue of General Grant (1896), in Brooklyn; Pocahontas, at Jamestown; Nathan Hale, at St. Paul and at Washington; Alexander Hamilton and Thomas Jefferson, at Columbia University. His largest ideal work is the Kauffman Memorial in Rock Creek Cemetery, Washington. Other work includes a noble "Madonna" (1893), Brooklyn Museum; the baptismal font for the cathedral of Sts. Peter and Paul, Washington (1905); group of Christ and St. John, Brooklyn Museum; Schermerhorn Memorial for Columbia University, New York; a "Pietà," in St. Patrick's Cathedral, New York; and the ideal heads of "Peace" (Metropolitan Museum), "Destiny," and "Nearing Home" (Corcoran Gallery, Washington). But Partridge is perhaps at his best in his busts of the poets Whittier (Boston Public Library), Tennyson (owned by Henry van Dyke), Burns, and Longfellow. His work shows refinement, imagination, and versatility of

technique. In later years he frequently experimented with new impressionistic methods. He also became well known as a lecturer and writer on art and letters. His publications include *Art for America* (1894); *Song Life of a Sculptor* (1894); *The Technique of Sculpture* (new ed., 1906); *The Angel of Clay* (1900), a novel; *Nathan Hale* (1902); *The Czar's Gift* (1906), a novel. Consult *The Works in Sculpture of William Ordway Partridge, with Biographical Sketch* (New York, 1914).

PARTRIDGE BERRY (*Mitchella repens*), sometimes called CHECKERBERRY. This plant, named for Dr. John Mitchell, an early American botanist, is a smooth, trailing, evergreen plant with round or ovate shining leaves, sometimes streaked with white, and fragrant white flowers, sometimes streaked with purple. These are suc-

PARTRIDGE BERRY (*Mitchella repens*).

ceeded by edible berries which are usually scarlet and remain on the plant over winter. The partridge berry is commonly found in dry woods from Nova Scotia to Minnesota and south to Texas, growing about the bases of trees. *Mitchella repens* belongs to the family Rubiaceæ. It is also called squaw vine and twin flower, the latter name from the fact that the flowers are often borne in pairs. The plant is reputed to have medicinal properties.

PARTRIDGE COCHIN. See Plate of POULTRY

PARTRIDGE DOVE, or PARTRIDGE PIGEON. An Australian pigeon of the genus *Geophaps*, approaching in character and habits to the gallinaceous birds and particularly to partridges. The plumage has a bronze tinge and lustre on the wings, which resembles that of the closely allied bronzewing (q.v.). There are several species. They live mostly on the ground, and rise with a whirring noise, like the pheasant, when disturbed. They are highly esteemed for the table. *Geotrygon montana*, a species of another genus, bears the name partridge dove in the West Indies. It also seeks its food chiefly on the ground, although it affects well-wooded districts.

PARTRIDGE WOOD. A very pretty, usually reddish, variously streaked hard wood from the West Indies and Brazil, where it is used in

shipbuilding. In choice specimens the layers of wood are curled upon one another so as to resemble the feathers of the partridge; hence its name. Its chief use in other countries is for cabinetwork, canes, parasol sticks, fans, and other small articles. It is said to be yielded by *Andra mermis*, a leguminous tree referred by some botanists to the genus *Vouacapoua*.

PARTSCH, *pärch*, JOSEPH (1851-). A German geographer, born at Schreiberhau, Silesia. He studied at the University of Breslau, receiving his doctorate in 1874, and began teaching at the university, becoming later professor of geography. Here he remained until 1905, when, on the death of Ratzel, he was called to the chair of geography at the University of Leipzig. His earlier writings were devoted to classical geography, but in later years he wrote extensively on glacial geology, the history of geography, and regional geography. In the last group are some of his best-known works, such as the systematic monographs on the Ionian Islands, the standard geography of central Europe, and the geography of Silesia. Among English-speaking people he is best known as the author of *Central Europe* (English, 1903, German, 1904), the English edition, prepared by H. J. Mackinder, appearing in the series "The Regions of the World." This book is of particular value for its account of the physiography of the region which became the battle ground of Europe (1914 et seq.) and especially for the last chapter, "The Conditions of National Defense."

PARTS OF SPEECH. See GRAMMAR, *Parts of Speech*.

PARTURIENT APOPLEXY, or PARESIS. A disease of live stock. See MILK FEVER.

PARTURITION. See OBSTETRICS.

PARTY NAMES (OF, *Fr* *partie*, from *ML partita*, party, part, *Lat. partita*, fem sing of *partitus*, p p of *partiri*, to divide). The following is a partial list of the political groups which have existed in the United States, Great Britain, and Canada, some of which, however, were never definitely organized as parties; also some which, while of apparently religious origin, exerted a distinct political influence.

Abolitionists—Those who strove to secure the abolition of slavery. (See article on this title.)

Adamites—The political supporters of John Quincy Adams. The expression was current from about 1821 to 1832. **Adullamites**—The name given to a group of seceding British Liberals in 1866. (See article on this title.) **American Party**—A party which originated in New York in 1835, and which was organized as a national party about 1852. Its purpose was expressed in the motto "America for Americans." Later it became known as the Know-Nothing party. It had practically disappeared by 1856. The name was also applied to two other parties in the history of the United States. (See AMERICAN PARTY; KNOW-NOTHINGS.)

Anti-Federalists—The name applied to those who opposed the adoption of the Constitution of the United States. (See ANTI-FEDERALISTS.)

Anti-Imperialists—(See IMPERIALISM.) **Antimasons**—A party which originated in New York in 1826, its chief principle being hostility to the Masonic Order. (See ANTIMASONS.)

Anti-Nebraska Party—A party formed in 1854 after the enactment of the Kansas-Nebraska Bill and composed mainly of Northern Whigs who were opposed to the repeal of the Missouri Com-

promise. **Antirenters**—The name applied to those in New York who opposed the collection of rent from the tenants occupying the old patroon estates. The movement flourished during 1839-47. (See ANTIRENTISM.) **Baldwin Reformers**—(See POLITICAL PARTIES, *Canada*.)

Barnburners—The radical wing of the Democratic party in New York for several years after 1844. They were arrayed against the Hunkers (q.v.), who were more practical men and who were supported by the Tammany Society. (See BARNBURNERS.) **Black Republicans**—The name applied, chiefly in the South at the close of the Civil War, to those supporting the Republican party, on account of their sympathy for the negro. **Bourbons**—Originally applied to the Southern Democrats of the old school, but now used of any reactionary who adheres obstinately to tradition. **British-American League**—A Canadian political party formed in 1849 to counteract the manifesto for annexation to the United States issued in Montreal the same year. The league upheld British connection, a national policy of protection, and advocated the federation of the British North American provinces.

Bucktails—A political faction originating in New York in 1815 and opposed to the administration of Governor Clinton. They were so called from the habit of wearing bucktails in their hats. **Canada First**—A political party formed in Canada in 1874 to emphasize the feeling for nationalism. Its headquarters were in Toronto. Its radical element looked to independence, but a considerable number favored British connection. Its organization was not effective, and the party soon ceased to exist. **Carpetbaggers**—(See article on this title.)

Cavalier—(See article on this title.) **Chartists**—(See CHARTISM.)

Clan-na-Gael—(See article on this title.) **Clear Grits**—A Canadian political party, so named because no half-hearted supporters were to be tolerated, but only those who were "clear grit."

Its founders were advanced Reformers or Liberals whose dissatisfaction with the moderate element of their party led to the demand for universal suffrage, elective officials and institutions, biennial parliaments, and other reforms in part resembling those demanded by Chartism (q.v.). It was founded in 1851, but lacked coherence and soon ceased to be politically efficient. Much of the spirit which animated it was revived in the Canada First party. The term "Grit" was afterward applied to the Liberal party as a nickname. **Conservatives**—(See POLITICAL PARTIES, *Great Britain*.)

Constitutional Union Party—A party organized in 1860 and composed mainly of former Southern Whigs. (See CONSTITUTIONAL UNION PARTY.)

Copperheads—The name applied by the Republicans during the Civil War to the Democrats of the North who did not believe in prosecuting the struggle with the South and some of whom sympathized with the cause of the Confederates. (See COPPERHEADS.)

Cooperationists—The term applied at the time of the secession controversy in the Southern States to those who favored the secession of their own State only in the event of "coöperation" of their sister States. **Court Party** (old and new)—The term applied to the supporters of two rival superior courts in Kentucky. (See KENTUCKY.)

Covenanters—(See COVENANTS, THE.) **Croppies**—(See article on this title.)

Democratic Republicans—(See DEMOCRATIC PARTY.) **Democrats**—(See DEMO-

CRATIC PARTY.) *Doughfaces*.—The name sneeringly applied by John Randolph, of Roanoke, about 1820, to Northern members of Congress who supported the slavery interests by their votes. *Dryes*.—Another term for those favoring the prohibition of the liquor traffic. *Equal Righters*.—A Canadian political party organized in 1889 in Toronto, Ontario, to procure the disallowance of the Jesuits' Estates Act of 1888 and generally to oppose the alleged political encroachments of the ultramontane Roman Catholics of Canada. It had able supporters in the Dominion Parliament, and gave effective assistance in settling the Manitoba school question. (See MANITOBA, *History*.) *Fair Traders*.—The name applied towards the close of the nineteenth century to the British opponents of Free Trade, which they considered one-sided and therefore to be remedied by trade based on fair conditions of reciprocity between the nations concerned. Fair Traders were mostly Conservatives, and their object was an Imperial customs union between Great Britain and her colonies. It was put forward as the economic basis of Imperial Federation. *Family Compact*.—A group of Tory leaders and families in Upper Canada (Ontario), so named because they held power as a distinct body united by ties of social, religious, and political sympathy. They monopolized the public offices, but their power was overthrown by the Upper Canada rebellion of 1837-38. *Federalists*.—(See article on this title.) *Femians*.—(See FENIAN SOCIETY.) *Fifth-Monarchy Men*.—(See article on this title.) *Free-Soilers*.—A party which first came into prominence in 1848. It was made up of men opposed to the extension of negro slavery. (See FREE-SOIL PARTY.) *Gold Democrats*.—A party of disaffected Democrats who refused to support the regular party platform and candidates in 1896. They adopted a platform favoring the gold monetary standard and nominated J. M. Palmer, of Illinois, for President. *Grangers*.—(See article on this title.) *Greenbackers*.—A party advocating the issue of an irredeemable paper currency. It was prominent during the decade from 1876 to 1886. (See GREENBACK PARTY.) *Half-Breeds*.—The moderate wing of the New York Republicans, 1881-85, opposed to the Stalwarts (q.v.). *Hards*.—A name applied to one of the Democratic factions in New York prior to the Civil War. They were opposed to the "Softs." *Hunkers*.—(See HUNKERS.) *Imperial Federationists*.—(See IMPERIAL FEDERATION.) *Imperialists*.—(See IMPERIALISM.) *Irish Nationalists*.—(See POLITICAL PARTIES, *Great Britain*.) *Jacksonites*.—The followers of Andrew Jackson, 1825-29, opposed to the Adamites. *Jacobites*.—(See article on this title.) *King's Friends*.—The name applied to the political party which supported George III in his attempts to increase the royal power. It was active in upholding the King and Lord North in their efforts to tax the American Colonies. *Know-Nothings*.—(See article on this title.) *Labor Party*.—(See POLITICAL PARTIES, *Great Britain*.) *Land Leaguers*.—The name applied for some time to the supporters of Charles Stewart Parnell, leader of the Irish party, after he had become president of the Land League (q.v.). *Lollard*.—(See LOLLARD.) *Loyalists*.—(See article on this title.) *Liberal-Conservatives*.—The name applied to the Conservative party of Canada under the leadership of Sir John A. Macdonald (q.v.). *Liberals*.—(See

POLITICAL PARTIES, *Great Britain and Canada*.) *Liberals or Liberal Republicans*.—Those Republicans who opposed the reelection of President Grant in 1872 and favored a more liberal policy as regards the Southern question. (See LIBERAL REPUBLICAN PARTY.) *Liberal-Unionists*.—(See POLITICAL PARTIES, *Great Britain*.) *Liberty Party*.—A party which was formed about 1840 for the purpose of securing the abolition of slavery. (See article on this title.) *Lily Whites*.—The term applied to white Republicans in the South who favor the exclusion of negroes from the party. *Loco Focos*.—A popular nickname given to a faction of the Democrats in New York during the administration of Van Buren. (See article on this title.) *Loose Constructionists*.—The term applied frequently to the Federalists and later to the Whigs, on account of their advocacy of a liberal interpretation of the Constitution of the United States. *Mahonists*.—A party in Virginia consisting of the followers of Gen. William Mahone, who bolted from the Democratic party in 1878. (See READJUSTERS.) *Middle-of-the-Road Populists*.—(See POPULIST PARTY.) *Mugwumps*.—(See article on this title.) *Nationalists*.—The name of a French-Canadian political party formed to conserve the privileges and promote the development of the French-speaking race in Canada. It claims exemption of the French from the foreign complications to which Canada is liable on behalf of Great Britain. Its most conspicuous leaders are Honoré Mercier (q.v.) and Henri Bourassa (q.v.). *National Republicans*.—(See WHITE PARTY.) *Native Americans*.—(See KNOW-NOTHINGS.) *Nullifiers*.—Those who advocated the right of a State to suspend within its own boundaries the operation of a law of the United States. Only in South Carolina, 1828-32, did this become the basis of a party organization. (See NULLIFICATION.) *Orangemen*.—(See article on this title.) *Parti Rouge*, or the *Quebec Rouges*.—The name applied to a political party of French-Canadian Liberals, formed about 1849. Its adherents at first avowed republican opinions which had spread from France, but later grew more moderate and held the principles which actuated British Constitutional Liberals. They coöperated with the Upper Canada Reformers who fought for responsible government, and they stood for freedom of speech and resistance to ecclesiastical domination. *Patriotes*.—A name assumed by the popular French party in Lower Canada immediately before and during the rebellion of 1837-38. It was specially applied to the followers of L. J. Papineau. As a party it disappeared after the rebellion, but much of its spirit was revived in the Parti Rouge. *People's Party*, or *Populist Party*.—A political party first organized on national lines in 1892. (See POPULIST PARTY.) *Progressive Party*.—A party organized at Chicago in 1912 under the leadership of ex-President Roosevelt. (See PROGRESSIVE PARTY.) *Puritans*.—(See article on this title.) *Prohibitionists*.—Those who advocate abolition of the liquor traffic. Since 1872 there has been a national Prohibition party. (See PROHIBITION.) *Radicals*.—The name applied after the Civil War to the extreme wing of the Republican party as regards its policy in dealing with Southern questions. (See also RADICALISM and POLITICAL PARTIES, *Great Britain*.) *Readjusters*.—A local party in Virginia in 1878 headed by Gen. William Mahone and favoring a conditional repudiation of

the State debt. (See *READJUSTERS*.) *Repealers*.—A political party in Nova Scotia which urged the withdrawal of that province from the Canadian Confederation. *Repudiators*.—A party in Mississippi which advocated the repudiation of a large number of Union bank bonds, the payment of which the State had guaranteed. (See *REPUDIATION*.) *Relief Party*.—The name applied to the supporters of a movement in Kentucky which had for its purpose the enactment of measures by the Legislature for relieving the people of economic and financial burdens. "Relief" parties were common in other States from 1830 to 1860. (See *KENTUCKY*.) *Republicans*.—(See *REPUBLICAN PARTY*.) *Roundheads*.—(See article on this title.) *Scalawags*.—The name applied to native Southerners during the reconstruction era who affiliated with the Republican party. *Silver Grays*.—The conservative wing of the Whig party. *Silver Party*.—A party made up chiefly of disaffected Republicans in 1896, who favored the free coinage of silver. It indorsed the Democratic nominees for President and Vice President in that year. *Socialists*, or *Socialist-Labor Party*.—This first appeared as a national movement in 1892, when it nominated candidates for President and Vice President and adopted a platform advocating a Socialistic policy in governmental affairs. *Stalwarts*.—A wing of the Republican party in New York from 1880 to 1885, led by Roscoe Conkling and representing the "machine" politics of the party. (See article on this title.) *Strict Constructionists*.—The name given to those who advocated the strict interpretation of the Constitution of the United States. (See article on this title.) *Suffragettes*.—The name of the British women's political party which contends for the franchise by methods known as militant. (See *WOMAN SUFFRAGE*.) *Suffragists*.—The name of a women's political group which contends for the franchise by constitutional methods. It has adherents both in Britain and the United States. (See *WOMAN SUFFRAGE*.) *Ulsterites*.—The name of a political group in Ulster and in other parts of Ireland strongly Protestant, which opposed Irish Home Rule. Its leader was Sir Edward Carson (q.v.). *Ultramontanists*.—(See article on this title.) *Union Labor Party*.—A movement which first became national in 1888. It nominated candidates for President and Vice President and adopted a platform of principles. *Union Leagues*.—Organizations of a political character in the Southern States for a time after the Civil War, composed chiefly of negroes and white Republicans. *United Empire Loyalists*.—(See *LOYALISTS*.) *Washingtonians*.—The term early applied to the Prohibition party *Whigs*.—(See *WHIG PARTY*; also *WHIG AND TORY*, and *POLITICAL PARTIES, Great Britain*.) *Woman's Rights Party*.—A party which first appeared as a national movement in 1884. Both in that year and in 1888 it held national conventions and nominated candidates for President and Vice President, pledged to advocate the general introduction of female suffrage.

PARTY WALL. A wall dividing adjoining properties in which the owners of the respective parcels have common rights as to its use and maintenance. By the English common law, where the wall is partly on both lots, the adjoining proprietors are presumed to be tenants in common of the wall and probably of the land on which it stands. In the United States, if the wall stands so that it is partly on both lots, the

owner of each lot retains the fee in the part of his land covered thereby and also owns the portion of the wall standing on his lot, subject, however, to the easement of support incident to a party wall, in favor of the adjoining owner.

A party-wall easement may, like any other easement, be created by grant, by prescription (or, generally, 20 years' user), and in a few States by virtue of statutes authorizing a person under certain circumstances to build a party wall between his land and that of his neighbor and to exact contribution from the latter. The weight of authority in the United States is to the effect that statutes of this nature are unconstitutional, as taking private property without compensation for private purposes. In the few States where such statutes exist they are held valid as a legitimate exercise of the police power. Neither owner of a party wall has a right to extend the front and rear walls of his building farther than to the middle of the party wall, nor is either entitled to maintain a window therein, even if the other party is not using his side. Either owner may increase the height of a party wall, provided the wall is thick enough to bear the increased weight, or may increase its thickness on his own land. When a party wall becomes unsafe or dangerous, either party may repair it, even to the extent of rebuilding it, without causing injury to the other, but the one repairing or rebuilding cannot in general require the other to pay any part of the cost thereof. In most jurisdictions it is held that if the wall is totally destroyed from any cause the easement is at an end, and neither party can rebuild without the consent of the other. Where a wall is rebuilt by consent, it is generally considered that the party-wall easement revives without a new grant. See *EASEMENT*.

PAR VA'GUM. See *PNEUMOGASTRIC NERVE*.

PARVATI, par'wà-tē (Skt., mountain born). In Hindu mythology, the beneficent aspect of the wife of Siva (q.v.). She was a reincarnation of Um (q.v.), and was born as a daughter of Himavat or the Himalaya Mountains, from which circumstance she received her name. According to another account, she was the daughter of the combined glances of Brahma (q.v.), Vishnu (q.v.), and Siva, and was born on Mount Kailasa in the Himalaya. She was then white, red, and black, the colors of Brahma, Vishnu, and Siva respectively, but at Brahma's request divided herself into three forms, of which the white, Sarasvati, was the wife of Brahma; the red, Lakshmi (q.v.), the wife of Vishnu; and the black, Parvati, the wife of Siva. Parvati plays little part in Hindu mythology, manifesting her power chiefly under her aspects of Durga (q.v.) and Kali (q.v.). Consult W. J. Wilkins, *Hindu Mythology* (2d ed., London, 1900), and see, for illustration, Plate of *HINDU DEITIES* in the article *INDIA*.

PARVIN, THEOPHILUS (1829-98). An American obstetrician. He was born in Buenos Aires, was a graduate of the universities of Indiana and of Pennsylvania (M.D., 1852), and after a dozen years' practice in Indianapolis became professor in the Ohio Medical College (1864). From 1869 to 1872 he taught in the medical department of the University of Louisville, then was professor of obstetrics and infantile diseases in Indiana Medical College, and in 1883 was chosen to a like chair in Jefferson Medical College, Philadelphia. Dr. Parvin was president of the Indiana State Medical Society

in 1861 and of the American Medical Association in 1879. He wrote *The Science and Art of Obstetrics* (1886) and edited *Winchel on the Diseases of Women* (1887).

PASADENA. A city in Los Angeles Co., Cal., 9 miles by rail northeast of Los Angeles, on the Southern Pacific, the Atchison, Topeka, and Santa Fe, and the Salt Lake railroads (Map: California, G 8). It is an attractive residential place and a well-known winter resort, its healthful climate and beautiful situation contributing to its popularity. Green Hotel, Maryland Hotel, Hotel Huntington, and Raymond Hotel are among the most prominent buildings of Pasadena. There are also the Throop College of Technology, a public library containing 45,000 volumes, a \$200,000 high-school building, and several beautiful parks. Of interest in the vicinity are the Busch Sunken Gardens, Oak Knoll, the Carnegie Solar Observatory, and the San Gabriel Mission. Pasadena was settled in 1874 by a colony from Indianapolis and soon became known for its horticultural enterprise. It is the centre of extensive fruit-growing interests, the cultivation of oranges and lemons being especially important. There are large packing houses, many drying establishments, a large cannery, flour mills, and manufactures of woodwork, boots and shoes, cut glass, and brick. Pasadena was first incorporated in 1886 and in 1913 adopted the commission form of government. The water works and electric-light plant are owned by the city. Pop., 1900, 9,117; 1910, 30,291; 1914 (U. S. est.), 40,880.

PASANG, pā'zang. See GOAT, and Plate of WILD GOATS, SHEEP, ETC.

PASARGADÆ, pā-sīr'gā-dē (Lat., from Gk. *παρσαργάδαι*). The ancient capital of Persia and royal seat of Cyrus prior to the founding of Persepolis (q.v.) by Darius. The etymology of the name is uncertain, and the suggestion that it may have represented a Græcized form of a presumable OPers. *Pārsa-vardana* (city of Persia), equivalent in meaning to *Persepolis*, would have to be reconciled with the fact that according to Herodotus, the name Pasargadæ was also a designation of one of the three noblest tribes in early Persia. The site of the city of Pasargadæ in antiquity has been positively identified through ruins which still exist, particularly the Tomb of Cyrus the Great, as located in the Plain of Murghab, about 40 miles northeast of Persepolis, on the main highway between Ispahan and Shiraz. This plain, some 9 by 15 miles in expanse, is surrounded by mountains and watered by the small river Pulvar. The ruins lie largely in its western part.

On this spot was founded Cyrus's Imperial capital, and the presence of mountain barriers, which practically guard against access by a hostile invader, apparently precluded the necessity of fortified walls, as traces of these seem to be lacking so far as archaeological researches have revealed.

As one approaches the ruined remnants of Pasargadæ, in following the road southward towards Shiraz, one sees first, on the left of the highway, the remains of a massive platform which crests the height of a low ridge and overlooks the plain. It is constructed of immense blocks of carefully hewn stone and apparently remained unfinished, but is believed to have been designed as a royal audience platform of Cyrus that antedated the great palace terrace

of Darius, Xerxes, and their successors at Persepolis. The natives call this megalithic platform the Throne of the Mother of Solomon (*Takht-i Madar-i Sulaimān*) or simply Solomon's Throne (*Takht-i Sulaimān*), for Mohammedan tradition has obliterated the historic significance of the structure.

Farther westward stand the remains of a towering wall which once formed a portion of a solid square stone building, locally known as Solomon's Prison (*Zindān-i Sulaimān*), but which must have once been either a fire temple or a tomb. At some distance to the northeast of the Prison are found likewise two ancient fire altars of stone (*Ātash-gāhs*).

Several hundred yards southwestward from the Prison is a pilaster or angle pier of a noble building that is now traceable only by vestiges. This corner post is composed of three rectangular blocks of a yellowish-white limestone, rising 20 feet high, and still bears an inscription, chiseled in cuneiform letters in three languages, Old Persian, Elamitic, and Babylonian, with the words "I, Cyrus the King, the Achæmenian." The same device is repeated on the three angle piers (for the fourth is missing) of another ruined edifice lying somewhat to the southwest and locally known as *Divān-i Khānah* (Hall of Audience). In this ruin are perhaps to be traced the remnants of a larger palace of Cyrus, strikingly marked by a lone cylindrical column of limestone, over 30 feet high, the lower of whose three smooth drums forms a part of the supporting base of the shaft.

Not far to the southeast of these remains are the vestiges of still another collection of ruins, comprising bases of doorways and pedestals of white stone, which seem to be the traces of a smaller palace. Associated with these in noteworthy manner is a famous monolith which bears an Achæmenian bas-relief, well known because often depicted. It consists of a huge slab of gray limestone, now much weathered, over 12 feet high, 5 feet broad, and about 2 feet thick. On its surface is carved in low relief a majestic human figure, bearded, and surmounted by a crown which shows Egyptian affinities, while from the shoulders rise and droop to the feet two sets of magnificent wings. A cuneiform inscription, "I, Cyrus the King, the Achæmenian," once decorated the top, as is proved by the drawings of travelers who described and sketched the monument before the middle of the nineteenth century, but the inscription has since disappeared owing to the act of some vandal who cut off the upper part of the block. Judging from the device that once capped the monolith, it seems probable that the bas-relief represented an idealized portrait of the great King Cyrus, but some scholars prefer to regard the image merely as a symbolic figure.

Last, but most important of all from the standpoint of history, is a structure near the extreme west or southwest of the plain. This is the Tomb of Cyrus the Great, identified through the classic records of those who accompanied Alexander the Great, who twice visited the tomb in his invading march through Persia. The mausoleum is a massive low stone building, houselike in shape, with a gabled roof, and it surmounts a terraced base of six stages or courses of stone resting on a plinth as foundation. The dimensions of the plinth are some 50 feet in length and 40 feet in width, upon which rise the stages on which the sepulchral monu-

ment is built. The point of its gabled roof is elevated some 35 feet above the ground. The sepulchre itself measures about 18 feet high, 20 feet long, and 17 feet broad, with a small entrance to the mortuary chamber. It is constructed of huge blocks of limestone that may well be mistaken for marble. Classic authors mention an epitaph, but if it existed over the doorway it has long disappeared, though the trained eye of the archæologist may still fancy to see traces of where it once was. Near it are the remains of the foundation of a building which may have been at the time a sanctuary of the Magian priests, who were the custodians of the Tomb of Cyrus, as Arrian says (*Anab.*, 6, 29, 7).

Jackson, *Persia Past and Present* (New York, 1906); Herzfeld, "Pasargadæ, Untersuchungen zur persischen Archäologie," in *Klio*, vol. viii, 1-68 (Leipzig, 1908); id., "Pasargadæ," in Sarre and Herzfeld, *Iranische Felsreliefs*, vol. ii, 147-186 (Berlin, 1910); Sykes, *History of Persia*, vol. i, pp. 189-191 (London, 1915); also the earlier authorities cited under PERSEPOLIS.

PASCA, pās'kā', ALIX MARIE ANGELE SÉON (known as MADAME PASQUIER) (1835-1914). A French actress, born at Lyons. In 1855 she was married to Alexis Pasquier and after his death made her theatrical début in 1864 at the Gymnase, Paris, in the *Demi-Monde*. Her reputation was firmly established in 1866 by the rôles she created in *Idées de Mme. Aubray* and especially in *Fanny Lear*. In 1870-74 she achieved a remarkable success at the Michel Theatre at St. Petersburg. She then appeared in London, and, returning to Paris, played in *La Charbonnière* (1884) at the Gaiety and in Curel's *L'Invitée* (1893) at the Vaudeville.

PASCAGOULA, pās'kā-gōō'lā. A city and the county seat of Jackson Co., Miss., 100 miles east of New Orleans, La., on the Pascagoula River and on the Louisville and Nashville and the Pascagoula-Moss Point Northern railroads (Map: Mississippi, H 10). Noteworthy structures are the high-school buildings, a Roman Catholic convent, and the county courthouse. There are fish and oyster, lumbering, and fruit-growing interests. A dock and naval machine shops are maintained here by the Federal government. Pop., 1900, 708; 1910, 3379.

PASCAGOULA RIVER. A river of Mississippi, formed by the junction of the Leaf and the Chickasawhay, both flowing southward through the southeastern part of the State (Map: Mississippi, H 9). It empties by two mouths, about 2 miles apart, into Mississippi Sound, 23 miles west of Mobile Bay. With its main head stream, the Chickasawhay, the Pascagoula is 250 miles long. It is navigable to Moss Point, 7 miles from its mouth. The stream is used as a waterway for timber cut on the pine barrens through which it flows.

PASCAL, pās'kāl', BLAISE (1623-62). A distinguished French philosopher, mathematician, and author, born at Clermont-Ferrand. He came of an Auvergnat family, ennobled in 1478 and for generations employed in the civil service. His mother died in his infancy, and his father moved in 1631 to Paris. Here he was educated by his father and showed remarkable precocity in mathematics. In 1641 the family removed to Rouen, where for a number of years Pascal was engaged in scientific studies, especially in phys-

ics. In 1648 his sister Jacqueline was attracted to the Jansenist convent at Port-Royal, and Pascal frequently accompanied her there, till their father took them both to Clermont, where Pascal remained for two years. In 1650 the family returned to Paris, and the next year the father died; Jacqueline joined Port-Royal, but Pascal remained in Paris till 1654, when he followed her thither. His decision to embrace the austere life of Port-Royal is said to have been caused by a carriage accident, though it is quite clear from minor writings of this period, such as *Prière pour demander le bon usage des maladies* (1648) and *Lettres sur la mort du père de M. Pascal* (1651), that the Jansenist faith and what is uncritically called Pascal's skepticism were already firmly fixed in his mind. From this moment he gave himself utterly to Port-Royal, continuing to believe in and labor for the progress of science, though sure that mental and moral certitude could be found only in revelation. He was not then a theologian, and he never acquired more than a superficial acquaintance with the fathers of the Church. Yet, with the equipment of his unsurpassed literary instinct and scientific training, he entered on his famous controversy with the Jesuits in the 18 *Lettres provinciales*. They were published clandestinely and pseudonymously in 1656 and 1657. The title of the collected letters reads: *Lettres écrites par Louis de Montalte à un provincial de ses amis et aux RR. PP. Jésuites; sur la morale et la politique de ces pères*. Subsequently the collection was entitled simply *Les provinciales*. It is evident that they were written under intense excitement, stimulated by the supposed miraculous cure of his niece through contact with a relic of the crown of thorns at Port-Royal. The letters were immensely popular and successful, but brought down both ecclesiastical and civil censures upon the unknown author. They are perhaps the greatest masterpieces in the literature of irony; there is no trace of declamation or of indignation, only a contemptuous smile, an insinuation of sarcasm, which in the latest letters yields occasionally to a stern but not impassioned invective, less effectual and less agreeable than the earlier manner. Pascal's style is unsurpassed in graceful energy and brilliant wit. It lacks tenderness and melody, but has the characteristically French virtues of being sharp, clear-cut, compact, and yet full in its utterance. He is the first French prose writer thoroughly at home with rhetorical tools. There has been gradual adaptation to new needs, but French prose has neither made nor needed to make a great advance since the *Lettres provinciales*. Considered, however, from the point of view of honest controversy, they cannot be praised so highly. At best they are special pleadings and do not represent the general spirit of the Jesuit Order. Accurate scholarship has pointed out numerous passages which misquote or misapply the authors quoted, or distort an *obiter dictum* of some obscure Jesuit, sometimes even a proposition condemned by the society, into its official teaching. His colleagues at Port-Royal, especially Nicole, furnished materials and collected references, and others were taken from a Calvinist collection published at Geneva in 1632. Pascal's part was that of the earnest and convinced barrister who pleads a case from materials put into his hands by others. He himself said, it is true, that he had read Escobar

through twice and had never used a passage from any author without having looked it up with its context. The real issue, however, is not between Jesuits and Jansenists, but between Puritanism and Probabilism. Pascal leads an ascetic reaction against the naturalism of the sixteenth century as we find it, on the one hand, in Rabelais and Montaigne, and, on the other, in Ronsard and the Classicists. This double movement of the Renaissance the Jesuits had sought to reconcile with Christianity by their ethics. Against this Pascal makes a Puritan and Augustinian protest, somewhat as Calvin had made it in a previous generation. The critic Brunetière thinks that Pascal made a mistake in scoffing at casuistics while he attacked Probabilism, and that in seeking to ruin the moral credit of the Jesuits he directed a blow against religion itself, which might have had serious consequences had it not been in some degree parried by Pascal's second great work, *Pensées sur la religion et sur quelques autres sujets* (1670).

For Pascal had not yet finished *Les provinciales* when he conceived the idea of supplementing this destructive work of criticism by a constructive *Apologie de la religion chrétienne*, by which, of course, he meant Jansenism. At this he worked serenely, though with much physical suffering and some self-inflicted refinements of asceticism, until his death, in 1662. He left it little more than a series of disconnected fragments, published with omissions, alterations, and some errors of mere carelessness in 1670. A more exact text, edited by Faugère, appeared in 1844. The general idea of the work is obvious if we conceive it to be a book of Jansenist apologetics. Pascal urges the wretchedness of man in himself and in his environments, the impotence of reason, the protest of despair, the invincible hope of better destiny, the solution of the difficulty in the doctrine of original sin, and the consequences of the acceptance of that doctrine, viz., expiation and redemption, dogmas foreshadowed in the Old Testament, confirmed by miracles, forming the essentials of Christianity, and credible by an effort of will.

Pascal's work in mathematics was also of considerable importance. He was the first one to attempt a philosophy of mathematics. When only 16 years old, he wrote a work on the *Geometry of Conics* (1639), most of which is lost, though a fragment has been restored from his correspondence with Leibnitz. It contained two important theorems, the one which is known as Pascal's theorem (see CONCURRENCE AND COLLINEARITY), and another, due to Desargues, that if a straight line cut a conic in P and Q , and the sides of an inscribed quadrilateral in A, B, C, D ,

we have the following relations: $PA \cdot PC \cdot QA \cdot QC = PB \cdot PD \cdot QB \cdot QD$

In 1665 he published his arithmetical triangle, a device for determining the coefficients of the expansion $(a + b)^n$. (See PASCAL'S TRIANGLE.) The theory of probabilities (see PROBABILITY) assumed form under the hands of Pascal and Fermat (q.v.). Pascal's last work dealt with a curve called by him the roulette and known later as the cycloid (q.v.).

Bibliography. Recent editions of the *Œuvres* are by P. Faugère, after autograph manuscripts (2 vols., Paris, 1886-95), and Léon Braunschvicg (14 vols., ib., 1904-14). There are modern editions of *Les provinciales* by Lesieur (1867),

Sacy (1877), Soyres (1880), Derôme (1880-86), Brunetière (1896), and others. Of the *Pensées* may be mentioned here the modern editions by Molinier (1877-79), Guthlin (1896), Michaut (1896), and Braunschvicg (3 vols., 1904); also an Eng. trans. by C. Kegan Paul (New York, 1911). With the *Pensées* are usually included the chief minor works, *Entretien avec M. De Sacy*, *Discours sur la condition des grands*, *L'Esprit géométrique*, *Préface d'un traité du vide*, and the Letters to Mademoiselle de Roannez. Both *Les provinciales* and the *Pensées* have been frequently translated. An elaborate edition was prepared by Boutroux in 1903. A full bibliography may be found in Louis Petit de Julleville, *Histoire de la langue et de la littérature française* (8 vols., Paris, 1896-99). Consult also: A. R. Vinet, *Studies on Pascal* (Eng. trans., Edinburgh, 1859); Victor Cousin, *Etudes sur Pascal* (5th ed., Paris, 1857); Dreydorff, *Pascal, sein Leben und seine Kämpfe* (Leipzig, 1870); J. L. F. Bertrand, *Blaise Pascal* (Paris, 1891); Leslie Stephen, *Studies of a Biographer*, vol. ii (New York, 1898); Adolphe Hatzfeld, *Pascal* (Paris, 1901); E. E. M. Boutroux, *Pascal*, Eng. trans. by E. M. Creak (Manchester, Eng., 1902); W. R. Clark, *Pascal and the Port-Royalists* (New York, 1902); W. J. Williams, *Newman, Pascal, Lousy, and the Catholic Church* (London, 1906); Fortunat Strowski, *Pascal et son temps* (3 vols., Paris, 1907-08); C. A. Sainte-Beuve, *Port Royal*, vols. ii-iii (new ed., ib., 1908); P. E. More, *Shelburne Essays, Sixth Series* (New York, 1909); H. R. Jordan, *Blaise Pascal: A Study in Religious Psychology* (London, 1910); St. Cyres, *Pascal* (New York, 1910), containing a bibliography; A. L. Gazier, *Les derniers jours de Blaise Pascal: Etude historique et critique* (Paris, 1911). The best study of his scientific works is Desloves, *Etude sur Pascal et les géomètres contemporains* (ib., 1878); also Albert Maire, *L'Œuvre scientifique de Blaise Pascal: Bibliographie critique et analyse* (ib., 1912).

PASCAL, pás-kál', ERNESTO (1865-). An Italian mathematician, born at Naples, where he was educated. From 1890 to 1908 he served as professor of calculus at the University of Pavia and thereafter was professor of algebra and higher analytics at the University of Naples. His publications include: *Esercizi e note critiche di calcolo infinitesimale* (1895); *Lezioni di calcolo infinitesimale* (1895); *Teoria delle funzioni ellittiche* (1896); *Calcolo delle variazioni* (1897; Ger. trans. by A. Schepp, 1899); *I determinanti* (1897; Ger. trans. by Hermann Leitzmann, 1900); *Repertorio di matematiche superiori* (2 vols., 1898-1900; Ger. trans. by A. Schepp, 2 vols., 1900-02); *I gruppi continui di trasformazioni* (1903).

PASCAL, FRANÇOIS. See GÉRARD, FRANÇOIS PASCAL, BARON.

PASCAL'S THEOREM. See CONCURRENCE AND COLLINEARITY.

PASCAL'S TRIANGLE. A device studied by Pascal (q.v.) for the determination of the coefficients of the expansion $(a + b)^n$, where n is any positive integer. The triangle is constructed in the way shown on page 137. In this triangle every number is equal to the sum of the numbers to the left and immediately above it, the figures in the n th diagonal extending upward from the left to right in the coefficients of the expansion $(a + b)^n$. It first appears in print on the title-page of an arithmetic by Apianus

(1527). It is also mentioned by Chu Chi-chieh, a well-known Chinese algebraist, in his *Sze-yuen Yu-kien* (1303), as an "ancient method." It

.
.

seems to have been long known in China. Johann Scheubel, a German algebraist, also used it a century before Pascal made the device famous.

PASCH, push, MORITZ (1843-). A German mathematician, born in Breslau and educated at the universities of Breslau and Berlin. In 1870 he became privatdocent at the University of Giessen, and was professor from 1873 until his retirement in 1911. His *Vorlesungen über neuere Geometrie* (1882) contained the first important system of axioms for descriptive geometry, and he also wrote. *Einleitung in die Differential- und Integral-Rechnung* (1882), *Grundlagen der Analysis* (1909), with Thaeer, *Veränderliche und Funktion* (1914)

PASCHAL, pás'kal. The name of two popes —**PASCHAL I**, SAINT (Pope, 817-824). The chief general importance of his pontificate lies in his relations with Louis le Débonnaire, who in 817 gave him concessions, the record of which forms the earliest extant document concerning the temporal possessions of the Roman see. In 823 he crowned Louis's son Lothar as Augustus, or co-regent with right of succession to the Empire. His letters are in Migne, *Patrologia Latina*, cii. Consult Simson, *Ludwig der Fromme* (Leipzig, 1874-76), and H. K. Mann, *Lives of the Popes*, vol. ii (London, 1906). —**PASCHAL II** (Pope, 1099-1118), Raniero di Bieda. As a monk of Clugny he came to Rome on business for his order and on account of his usefulness was detained there. Gregory VII made him Cardinal. On his election to the papacy he was opposed by an antipope claiming the title of Clement III, and three others followed before the schism was extinguished. His administration was marked by vehement conflicts with the civil power which concentrated in the question of investiture (q.v.). The Emperors Henry IV and Henry V and King Henry I of England were his principal opponents, Philip I of France was also excommunicated for his illegal union with the wife of Fulk of Anjou, but finally submitted and was reconciled. Consult E. Franz, *Papst Paschalis II* (Breslau, 1877), and B. Monod, *Essai sur la rapport de Paschal II avec Philippe I* (Paris, 1907).

The name of Paschal was also borne by two antipopes. One opposed Sergius I from 684, but in 687 was deposed and shut up in a cloister, where he died in 692. The other, who took the title of Paschal III, was set up in 1164 by the faction of Frederick Barbarossa and died in 1168. He is chiefly remembered for having canonized Charlemagne at the instance of Fred-

erick, but this action was not ratified by the Church.

PASCHAL CHRONICLE (Lat. *Chronicum Paschale*). A chronicle compiled in part from the Paschal canons (rules for the Easter festival) of various districts and towns and containing a summary of events in chronological order from Adam to 629 A.D., which was the twentieth year of Heraclius. It was at one time named also *Chronicum Alexandrinum*, because then attributed to a writer of Alexandria. The name of the author, however, is not known. It at first extended, according to the opinion of some, only to 354 A.D., in the reign of Constantius, the continuation of it with additions to the first part being the work of a later compiler. Others, however, regard it all as the work of one man. The manuscript in which it now exists (in the Vatican) is Byzantine work of the eleventh century. It is sometimes called also *Fasti Siculi*, because it was found in an old library in Sicily, from which it was taken to Rome. Notwithstanding its numerous faults, both of matter and style, it contains much valuable chronological information. There is a convenient edition in two volumes (Bonn, 1832). Consult J. van der Hagen, *Observationes in Heraclii Imperatoris Methodum Paschalem* (Amsterdam, 1736), and C. Krumbacher, *Geschichte der byzantinischen Literatur* (2d ed., Munich, 1897).

PASCHASIUS (päs-kä'si-üs) **RADBERTUS** (786-c.860). A theological writer of the Carolingian age. He was born near or in Soissons. In 814 he joined the monastery of Corbie, of which he was subsequently elected abbot. He was a member of the Synod of Paris and took part in the Assembly of Chiersy in 849. Two years afterward he resigned his position as abbot and devoted himself entirely to literary work. The most important of his writings are *De Corpore et Sanguine Domini*, which caused a prolonged controversy on the doctrine of the Lord's Supper, *Expositio in Lamentationes Jeremiae*, *De Fide, Spe et Caritate*; *De Partu Virginis*, in which he defended the virginity of Mary, the mother of Jesus. His works were published collectively at Paris in 1618 under the editorship of Sirmond.

PASCO, pä'skô, CERRO DE. A city of Peru. See CERRO DE PASCO.

PAS-DE-CALAIS, pä-de-kä'lä' (Fr. for Strait of Dover). A department in the north of France, embracing most of the old Province of Artois and part of Picardy (Map: France, N., H 2). Area, 2606 square miles. Pop., 1901, 955,391; 1911, 1,068,155. The surface is level, with the exception of a ridge of hills running from the southeast to the northwest, ending in (Gris-Nez Cape (qv) and forming the watershed between the North Sea and the English Channel. The highest point (695 feet) is reached a little to the southwest of Desvres. The 80 miles of coast, save at Boulogne, is sandy. The rivers, which are of no considerable length, are the Aa, Scarpe, and Lys, in the basin of the North Sea, and the Authie and Canche, belonging to the basin of the English Channel. The rivers are navigable within the department and are connected by canals. The climate is mild, but variable, and the fertile soil produces cereals, vegetables, and tobacco in abundance. Fishing is actively carried on, particularly in the neighborhood of Boulogne. The coal fields which lie about Bethune are the most important in France. Excellent stone is quarried and

considerable quantities of peat are cut. The industrial establishments are numerous and important, including iron and metal foundries, glass works, potteries, tanneries, bleach works, and textile mills for linen and lace. Capital, Arras. Boulogne and Calais are the principal ports. In the European War which broke out in 1914 the Germans made several attempts to capture these ports in order to control the English Channel. See **WAR IN EUROPE**.

PASDELOUP, pâ'd'-lô', JULES ETIENNE (1819-87). A French musical conductor, born in Paris. At 10 years of age he entered the Paris Conservatoire and in 1834 won the first prize for his piano playing. He held a government position after 1848, but three years later began the formation of an orchestra composed of Conservatory students, whom he trained to produce the symphonies of the best French and foreign composers. This was the beginning of the concerts populaires, which from their foundation in 1861 truly merited their name. The Legion of Honor and other marks of distinction were conferred on him, and his Sunday concerts were subsidized by the government and were carried on for more than 20 years. Padeloup managed the Lyric Theatre (1868-70) and was an instructor at the Conservatoire in 1847-50 and again in 1855-68.

PASEWALK, pil'ze-vâlk. A town of Pomerania, Prussia, on the Ucker, 22 miles west-northwest of Stettin (Map: Germany, F 2). It contains several churches and a bronze statue of Frederick III erected in 1895. The manufactures include tobacco, starch, flour, oil, and plaster, and there are iron foundries, flour and saw mills. Pop., 1900, 10,299; 1910, 10,916.

PASHA, pâ-shâ', or **BASHA**. A title used in the Ottoman Empire. The derivation of the term is uncertain. It has been connected with the Turkish *bash*, head, chief; with the Persian *padshah* from *pad*, protector, and *shah*, king, or *pa*, foot, and *shah*; or with the Aramaic *pacha*, Hebrew *pecha*, Assyrian *pacatu*, governor. It is bestowed upon high civil and military officers. Of the latter there are three grades, symbolized by the number of horsetails formerly borne before them on occasions of state. Three tails signify general in chief; two tails, general; and one, brigadier. The actual symbols, which are of Mongolian origin, were abolished by Mahmud II (1808-39), but the grades still exist. Admirals also have the title pasha. Civil officers of the rank of vizier, provincial governors, and others also receive the title. It has been bestowed on Christians as well as on Moslems. The province governed by a pasha is known as a pashalik or vilayet. The authority of the pasha in his province was formerly absolute, but he is now held in check by local councils, and the Sultan may at any moment remove the pasha and even put him to death. See **BASHI**.

PASHICH, pâ'shîch, NICOLA (1846-). A Serbian statesman, born in Saïchar (Zaychar). He was educated at Belgrade and in the Zurich Polytechnicum and from 1872 to 1875 was in the Serbian service as an engineer. He fought in the war with Turkey in 1876-78. After practicing engineering for a few years he became a member of the Skupshtina in 1878 and one of the leaders of the Radical party in 1881. For a plot against King Milan he was sentenced to death, and lived in exile from 1883 to 1889, when he was amnestied. Immediately after his return he became president of the

Skupshtina and mayor of Belgrade and in 1891-92 Premier. In 1893-94 he was Ambassador to Russia. Condemned to five years' imprisonment in 1899 for complicity in another attempt on the King, he was immediately pardoned, apparently because of Russia's intervention. In 1904 he was Minister of Foreign Affairs and from December, 1904, to May of the next year, and from April, 1906, to June, 1908, was Premier. He held the reins, actually though not nominally, in 1909 in the Austrian crisis. In September, 1912, he again became Premier. The following June he offered his resignation because his moderate policy with Bulgaria was unpopular, but the King kept him in power and he was in charge during the Austrian crisis of 1914.

PASHIUBA (pâ'shê-ô'bâ) **PALM**. See **IRIARTEA**.

PASHKOV, pâsh'kôv, VASIL ALEXANDROVITCH (?-1902). A Russian religious reformer, founder of an evangelical sect, called after him the *Pashkovtsy*. An officer of the Imperial Guard and with high connections, he was brought to accept Lord Radstock's views of primitive Christianity (1874), founded an association for the encouragement of religious reading (1876), which was abolished about 10 years later, and did a simple and unassuming evangelical work in which he met with great success, especially among his own class. He spent almost his entire fortune in wise charity. During the reign of Alexander II, a ruler with whom Pashkov was on terms of intimacy, the work was uninterrupted. In 1884, however, he was forced into exile, first from St. Petersburg and then from the whole of Russia, the immediate occasion being his attempt to unite the Stundists and Baptists of the south with his own northern sect by means of a simple creed. He afterward lived in Austria, England, and France. The earnestness and directness of his appeal were such that his religious enemies, of which he had many among all denominations, feared his influence with the masses. None, not even Tolstoy, his contemporary religious reformer, ever had such a large following as this unassuming preacher of a universal gospel which appeals to the heart rather than to the mind. For a brief but appreciative study of his life and work, consult the *Eclectic Magazine*, vol. cxxxix, 3d series, pp. 344-350.

PASHTU, pûsh'tôo, or **PUSHTU**, pûosh'tôo. See **AFGHAN**.

PASIG, pâ'sêg. The outlet of the Laguna de Bay, in Luzon, Philippine Islands. See **MANILA**.

PASIG. The capital of the Province of Rizal, in central Luzon, Philippines (Map: Philippine Islands, C 3). It is near the northwest corner of the Laguna de Bay, 8 miles east of Manila. The city was burned during the insurrection of 1897, and only a few well-built stone houses remain, the majority of the people living in bamboo or nipa huts. It has a fort and manufactures pottery. Pop., 1903, 11,287.

PASINI, pâ-zê'nê, ALBERTO (1826-99). An Italian landscape and figure painter, born at Busseto, near Parma. He studied at the Parma Academy and in 1851 went to Paris, where he was assistant to Cicéri and at first practiced lithography. In 1855 he accompanied Bourrée to Persia. Subsequently he traveled widely in the East and became the foremost Italian Oriental painter of the nineteenth century. His Spanish and Venetian scenes are scarcely less charming than his Eastern pictures, which are

full of atmosphere, clear in color, and minutely finished. Pasini was awarded the medal of honor at Paris in 1878. Excellent examples of his work are in the Metropolitan Museum, New York, and the galleries at Rome, Turin, Florence, and Parma.

PASIPHAE, pā-sī'fā-ē (Lat., from Gk. Πασιφάη). In Greek mythology, the daughter of Helios and sister of Circe. She was the wife of Minos, but, in consequence of his neglect to perform a certain vow, Poseidon rendered her enamored of a bull and she became the mother of the Minotaur. See MINOS; MINOTAUR.

PASITHÆA (Lat., from Gk. Πασιθέα). The wife of Hypnos, and one of the Graces.

PASKEVICH, pās-kā'vich, IVAN FEODOBOVITCH, COUNT OF ERIVAN, PRINCE OF WARSAW (1782-1856). A Russian field marshal, born at Poltava. He belonged to a Polish family, was a page of the Emperor Paul, and, entering the army in 1800, served in the campaign of Austerlitz. He fought subsequently against the Turks. He was also actively engaged in the campaign of 1812, was present at the battle of Leipzig in 1813, and participated in the conflicts under the walls of Paris. In 1826 he gained a great victory over the Persians under Abbas Mirza at Yelizavetpol and in the following year conquered Persian Armenia and captured Erivan. He obtained for Russia the advantageous Peace of Turkmanchai (1828). For these services he was created Count of Erivan. In 1828 and 1829 he made two campaigns against the Turks in Asia, taking Kars, Erzerum, and other important places. In 1831 Paskevich, now a field marshal, succeeded Diebitsch as commander of the Russian forces in Poland; he put an end to the revolt within three months after his appointment, taking Warsaw after a desperate resistance, Sept. 8, 1831. He was made Governor-General of Poland, and such was the vigor and severity of his rule that the eventful year of 1848 passed without any attempt at revolution. When Russian intervention in Hungary had been resolved upon in 1849, Paskevich marched into that country at the head of 200,000 men. The Hungarian main army, unable to make head against the double foe, laid down its arms at Világos, August 13. In 1854 Paskevich took the command of the Russian army on the Danube, but after an unsuccessful siege of Silistria he resigned his command and retired to Warsaw, where he died, Feb. 13, 1856. Consult Tolstoy, *Essai biographique et historique sur le Field-marshal Prince de Varsovie* (Paris, 1885).

PASLEY, SIR CHARLES WILLIAM (1780-1861). A British soldier and military engineer, born at Eskdale Muir, Dumfriesshire. He entered the Royal Military Academy at Woolwich in 1796, received a commission in the Royal Artillery in the following year, and in 1798 was transferred to the Royal Engineers. Between 1799 and 1810 he served in Minorca, Malta, Naples, and Sicily, at the siege of Copenhagen (1807), under Sir John Moore in Spain, and in Holland. Pasley was regularly promoted, becoming general in 1860. He did much to promote military engineering by his writings, which include: *Essay on the Military Policy and Institutions of the British Empire* (1810, 5th ed., 1914), *Military Instruction* (3 vols., 1814-17, 2d ed., 1822), *Practical Operations of a Siege* (2 vols., 1829-32).

PASPALUM (Neo-Lat., from Gk. πάσπαλος, *paspalos*, sort of millet, from *pās*, *pas*, all +

πάλη, *palē*, meal). A genus of numerous species of grasses, mostly natives of warm climates, with solitary or variously grouped spikes, one-flowered spikelets, and awnless paleae. *Paspalum scrobiculatum*, the cereal koda, cultivated in India, grows in dry loose soils. *Paspalum exile* is called fundi (see FUNDI) or fundungi in west Africa, where it is similarly cultivated. *Paspalum racemosum* is a very important fodder grass in the coast districts of Peru during the dry months of February and March. It has been introduced into France, but it is apt to be injured by frosts, and seldom ripens its seeds in the neighborhood of Paris. Several perennial species are indigenous in the southern United States, where they are highly appreciated as fodder and pasture grass. They have some of the characteristics of Bermuda grass (q.v.). *Paspalum compressum* (*Anastrophus compressus* or *Paspalum platycaule* of some botanists), commonly known as Louisiana grass or carpet grass, is considered an excellent lawn grass for the Southern States, being superior to Bermuda and less difficult to eradicate.

PASQUE (pâsk) **FLOWER** (OF. *pasque*, Fr. *pâque*, Easter, from Lat. *pascha*, Gk. πάσχα, Easter, from Heb. *pesach*, a passing over, Passover, from *pāsach*, to pass over), *Anemone*. A genus of perennial silky herbs of the family Ranunculaceae, by some botanists separated into the genus *Pulsatilla*, the chief distinguishing characteristic being the long feathery awns of the fruit. The common pasque flower (*Anemone pulsatilla*) is a native of Europe, with widely bell-shaped bluish-purple flowers, the petals of which are often used to color Easter eggs. *Anemone pratensis* has smaller and more perfectly bell-shaped blackish-purple flowers. These plants emit, when bruised, a pungent smell, due to an essential oil. *Anemone patens* is acrid and is said to blister the skin occasionally. *Anemone patens wolfgangiana*, also known as *Pulsatilla hirsutissima*, the American pasque flower, occurs abundantly from Illinois northward and westward. See ANEMONE.

PASQUE FLOWER
(*Anemone pulsatilla*).

PASQUIER, DUC D'AUDIFFRET. See AUDIFFRET-PASQUIER, E. A. G., DUC DE

PASQUIER, pā'skyā', ETIENNE (1529-1615). A French jurist and author. He early studied law under the ablest jurists of France and Italy and in 1549 was called to the bar. Having already secured a considerable practice, he in 1560 published the first part of his *Recherches de la France*, an antiquarian treatise on national politics, literature, and religion, written in French—an audacious innovation, since at that time scientific works were still written in Latin. In

1565 he made his celebrated speech defending the University of Paris from the encroachments of the Jesuits. He was in 1585 appointed by Henry III advocate-general of the Court of Accounts and followed the King on his retreat to the Loire, returning to Paris in 1594 with King Henry IV. Pasquier worked in wide and varied fields—poetry, fiction, law, history. From 1586 to 1619 appeared his celebrated *Lettres*, his correspondence with the scientific men of Europe.

PASQUIER, MADAME. See PASCA, ALIX.

PASQUINADE. See PASQUINO.

PASQUINI, pás-kwé'né, BERNARDO (1637–1710). An Italian organist and composer, born at Massa di Valnevola (Tuscany). For many years he was organist at Santa Maria Maggiore in Rome, enjoying the reputation of being a master of his instrument. His toccatas and suites for the harpsichord occupy a prominent place in the history of piano music, as they exerted considerable influence in the development of the sonata form. He also wrote 10 operas and eight oratorios. He died in Rome.

PASQUINO, pás-kwé'nó. The name given in Rome to a mutilated antique statue discovered in Rome in 1501 and erected in the Piazza Navona, near the Palazzo Braschi. From the beginning of the sixteenth century it was customary to affix to the statue epigrams on current events, frequently in the form of questions and answers passing between Pasquino and another statue known as Marforio (this statue was dug up in the Campus Martius, and so came a *Martis foro*). These epigrams were called pasquinades. The name is said to have been taken from a witty tailor of the end of the fifteenth century, who was renowned for his pungent criticisms of public men. The Roman populace, when the government checked its freedom of speech, found the use of these statues described above an outlet for its opinions; but since Marforio was transferred to the Capitoline Museum, Pasquino has not had much to say. The Italian pasquinades were in verse, usually Latin, though occasionally Greek. Pasquinades were written too in French in verse and in English in prose. Sir Thomas Elyot wrote a satire called *Pasquin the Plain* (1540), and Thomas Nash in his controversial pamphlets called himself "Pasquil of England."

PASSACAGLIA, pás-sá-kü'lyá. Originally an old Italian or Spanish dance form in $\frac{3}{4}$ time. During the eighteenth century composers for the piano introduced it into the suite, while organists wrote independent passacaglias for their instrument. Its chief characteristic is a short four or eight bar theme used throughout as a cantus firmus, which may appear in any of the voices, whereas in the chaconne (q.v.), a form almost identical with the passacaglia, the theme is constantly kept in the bass as an ostinato (q.v.). In modern times Brahms has revived the form in the finale of his fourth symphony.

PASSAGE (OF, Fr. *passage*, from ML. *passaticum*, right of passage, from *passare*, to pass, to step, from Lat. *passus*, pace). In music, a term applied to a rapidly executed ornamental figure which is not essential to the melodic outline. In concertos for solo instruments it is customary to give the performer an opportunity to display his mastery of mere technical skill. In the finale, just before the end, the composer indicates such a place by placing the word *ca-*

denza there. Such a cadenza has really nothing to do with the composition and consists of an extensive series of rapid ornamentations without any accompaniment. This is called *passage* work.

PASSAGLIA, pá-sü'lyá, CARLO (1812–87). An Italian theologian. He was born near Lucca, became a Jesuit in 1827, and in 1844 was appointed professor of canon law, and in 1845 of dogmatic theology, in the Collegium Romanum. During the temporary withdrawal of the Jesuits from Rome in 1848–51 Passaglia, with some of his brethren, went to England, where he taught theology to the young brethren of his order, and on the reestablishment of the Jesuits in the Roman College he resumed possession of his chair. During the discussions which preceded the definition of the doctrine of the Immaculate Conception (q.v.) he published an elaborate treatise on the doctrine and history of that question (1853). Becoming interested in the movement for Italian unity in 1859, he left the Society of the Jesuits, and attacked the temporal power of the Pope. Having fallen under suspicion in Rome, he withdrew from that city to Turin, where he established a journal entitled *Il Mediatore*, which appeared till 1866. In 1861 he was appointed by the King professor of moral philosophy, and subsequently of theology, in the University of Turin. In 1863 he became a member of the Turin Parliament. He is said to have sought reconciliation with the Church, but to have failed to make the required retraction. He died in Turin, March 12, 1887. Passaglia's principal works are the treatise on the Immaculate Conception already referred to; a treatise (Latin) on the primacy of St. Peter (1850); a scholastic treatise entitled *Commentarius Theologicus de Partitione Divinae Voluntatis* (1851); an apology for the cause of Italian unity, entitled *Pro Causa Italica; ad Episcopos Catholicos* (1861), in which he attacked the temporal power of the Pope and recommended the Church to make peace with the nation; several essays on religious and political subjects, and a reply to Renan's *Vie de Jésus* (1864). Consult his *Life* by Biginelli (Turin, 1887).

PASSAIC. A city in Passaic Co., N. J., 13 miles northwest of New York City and 4 miles south by east of Paterson, at the head of navigation on the Passaic River, and on the Erie, the New York, Susquehanna, and Western, and the Lackawanna railroads (Map: New Jersey, D 2). It has many paved and well-kept streets, lined with shade trees, a fine residential section, an excellent sewer system, and a park. There are 11 grade schools and a splendid high school, besides a number of private and parochial schools. The city has an adequate public library, housed in a handsome building, and among other noteworthy features are the two hospitals, a municipal building, another library, and the city hall. Passaic is extensively engaged in manufacturing, having good water power and excellent railroad facilities. The industrial establishments include large wool and textile mills, handkerchief factories, print and chemical works, rubber mills, metal works, tanneries, silk and belting mills, packing plants, etc. The output of these in 1909 was valued at \$41,729,000, representing an invested capital of \$42,841,000 and giving employment to 16,386 persons. Passaic spent in 1913 on maintenance and operation \$668,783, the chief items of expenditure being \$49,000 for the police department, \$65,000 for

the fire department, and \$339,000 for education. Pop., 1890, 13,028; 1900, 27,777; 1910, 54,773; 1915 (State census), 61,250.

Settled about 1676 and organized as a township in 1693, Passaic was incorporated as a village in 1869 and chartered as a city in 1875. Until about 1852 it was known as Aquackanonk Landing. The commission form of government was adopted in 1911. In November, 1776, Washington, retreating through New Jersey, crossed the Passaic at this point. Consult Pape and Scott, *News History of Passaic, from the Earliest Times to the Present Day* (Passaic, 1899).

PASSAIC RIVER. A river of northern New Jersey (Map: New Jersey, D 2). It rises a few miles southwest of Morristown, flows in a devious course northeastward to Paterson, then bends abruptly to the south, and flows into Newark Bay between Newark and Jersey City. It is about 100 miles long, and navigable for about 11 miles to Passaic. At Paterson it has a perpendicular fall of 50 feet, which furnishes immense water power.

PAS'SAMAQUOD'DY (perhaps, pollock catcher). A small Algonquian tribe, closely related to the Malecite and less intimately to the Abnaki proper, and formerly residing about Passamaquoddy Bay and St. Croix River, in Maine and New Brunswick. In customs they resembled the Abnaki, and, like them, acted with the French in the Colonial wars. They are now gathered, to the number of 380, at Pleasant Point and on Lewis Island, on the bay of their name. Consult Prince in *Proceedings of American Philosophical Society*, xxxvi (Philadelphia, 1897).

PASSAMAQUODDY BAY. An inlet of the Bay of Fundy, forming part of the boundary between Maine and New Brunswick (Map: Maine, E 3). It is 12 miles long by 6 wide and shut in by a cluster of islands so as to form an excellent harbor. It receives the St. Croix and other rivers. The city of Eastport, Me., lies on Moose Island, and at the head of the bay is the town of St. Andrews, New Brunswick.

PASSANT, pa'sin' (Fr., passing). An heraldic term used to express the attitude of an animal in a walking position, with his head straight before him. See HERALDRY.

PASSAROWITZ. See POZAREVATZ.

PASSAU, pas'ou. An ancient episcopal town of Bavaria, Germany, situated at the confluence of the Danube, the Inn, and the Ilz, on the Austrian frontier and 90 miles east-northeast of Munich (Map: Germany, E 4). The town proper is situated on the rocky tongue between the Danube and the Inn and is remarkably picturesque with its old-fashioned houses rising in terraces. The two suburbs of Innstadt and Ilzstadt are situated on the Inn and the Ilz respectively. Opposite Ilzstadt stands the old fortress of Oberhaus, dating from the beginning of the thirteenth century. The centre of the old town is the Domplatz, with the beautiful cathedral of St. Stephen, founded in the fourteenth century and rebuilt in the rococo style in the seventeenth century. Adjoining the cathedral is the post office, formerly the canons' residence, where the Treaty of Passau (q.v.) was concluded in 1552. Worthy of mention are also the old and the new rococo episcopal residences and the Rathaus. At Innstadt is situated the pilgrimage church of Mariahilf. The educational institutions include the Royal Bavarian Lyceum with faculties of theology and philosophy, a Real-

schule, a school of agriculture, a training school for teachers, a number of institutes for girls, and a library. The important manufactures are leather, porcelain, and cabinetwork. The city trades in paper, mirrors, matches, wire, and machinery, and does a good river business in wood, salt, and grain. Pop., 1900, 17,988; 1910, 20,983, chiefly Roman Catholics.

Passau proper occupies the site of the Castra Batava of the Romans, and Innstadt is identified with the Celtic settlement of Boiudurum, founded about 100 B.C. The bishopric of Passau, of which the town is the seat, was founded in 738, secularized in 1803, and reestablished in 1817.

PASSAU, TREATY OF. An agreement made in the year 1552 at Passau by the Elector Maurice of Saxony and Ferdinand, King of the Romans, representing his brother, the Emperor Charles V. It was signed by Maurice on August 2 and agreed to by the Emperor a few weeks later. It established peace between the Catholics and Lutherans pending the settlement of ecclesiastical matters by the next Diet, thus guaranteeing the free exercise of their religion to the adherents of the Confession of Augsburg in the states which had adopted this form of worship. A definitive settlement was effected at the Diet of Augsburg in 1555. Consult: Barge, *Die Verhandlungen zu Linz und Passau und der Vertrag von Passau* (Strassburg, 1893). Walther Kühne, *Geschichte des Passauer Vertrags 1552* (Göttingen, 1906); Gerhard Bonivetsch, *Geschichte des passauischen Vertrags von 1552* (ib., 1907). See REFORMATION, THE PROTESTANT.

PASSAVANT, pa'sa'vân', JOHANN DAVID (1787-1861). A German art critic and painter, born at Frankfurt-on-the-Main. He studied painting with David and Gros at Paris and afterward with the Nazarenes in Rome. His paintings are unimportant, but he eventually became inspector of the Städel Institute at Frankfurt and did much to promote art by virtue of his position and also by his literary works. The principal of these are *Rafael von Urbino und sein Vater Giovanni Santi* (1839-58) and *Le peintre-graveur* (6 vols., 1860-64), an appendix to Bartsch's standard work on the same subject. He had a fine appreciation of art, but his works, though scholarly and critical in their day, have been superseded. Consult his autobiography (Frankfurt, 1863) and the biography by Cornill (ib., 1865).

PASSAVANT, WILLIAM ALFRED (1821-94). An American philanthropist, born at Zelenople, Butler Co., Pa. He graduated at Jefferson College in 1840 and at the Lutheran Theological Seminary, Gettysburg, in 1842, was pastor of churches at Baltimore and Pittsburgh, and subsequently became widely known as the founder of hospitals and orphan asylums at various places in the United States. In 1870 he, with A. Louis Thiel, founded Thiel College, at Greenville, Pa. He introduced the Kaiserwerth system of deaconesses into the United States. From 1848 to 1861 he edited the *Missionary*, and subsequently was coeditor of the *Lutheran and Missionary*. Consult G. H. Gerberding, *Life and Letters of W. A. Passavant* (Greenville, Pa., 1906).

PASS CHRISTIAN. A town in Harrison Co., Miss., 58 miles east-northeast of New Orleans, on Mississippi Sound (Gulf of Mexico) and on the Louisville and Nashville Railroad (Map: Mississippi, G 10). It is one of the most

popular watering places on the Gulf, having a healthful climate and excellent facilities for boating, bathing, and fishing. Among its attractions is a wide shell-paved avenue lined with fine trees. It extends for 7 miles along the shore, where there are many pleasure piers. Pass Christian is the centre of an important oyster industry and is in a farming, grazing, and trucking district. It also has a large packing establishment. Pop., 1900, 2028; 1910, 2458.

PASSÉ, pá'sá'. A tribe of the great Arakan stock (q.v.), formerly the most numerous tribe on the Japura River, northwestern Brazil, but now nearly extinct. Both men and women are noted for their light complexion, fine figures, and handsome features, approaching the Caucasian type. They are clean in habit, intelligent, gentle, and industrious, and have been called the noblest tribe of the Amazon region. They tattoo their faces; the men cut the hair close, while the women wear it flowing loosely. They bury their dead in circular graves and are greatly under the influence of their priests.

PASSEMENT, pás'ment. See LACE.

PASSENGER PIGEON. The American wild or migratory pigeon. See PIGEON; also Plate of PIGEONS.

PASSENGERS. See CARRIER, COMMON.

PASSEPIED, pás'pyá' (from Fr. *passer*, to pass, from Lat. *passus*, step, from *pandere*, to stretch + *ped*, foot, from Lat. *pes*, foot). An old French dance in $\frac{3}{4}$ or $\frac{4}{4}$ time. It resembled the minuet, but was a little more lively. During the time of Louis XIV it was introduced into the ballet and was also often inserted in suites. It was divided into a number of parts of 8 or 16 bars each.

PASSERAT, pás'rä', JEAN (1534-1602). A French poet and scholar, born at Troyes. He taught in various Provençal colleges until 1569, when he gained the patronage of Henri de Mesnes and settled in Paris. In 1572 he succeeded Ramus as professor of eloquence and Latin poetry at the Collège de France, where his learning and wit brought him many pupils. But Passerat was a patriot, and during the Wars of the League he had to suspend his courses. At this time he was one of the authors of the *Satire Ménippée* (1594), which was his chief literary achievement. The grace, point, and erudition of his verse make him one of the most interesting of the post-Pléiades. His works include: *Vers de chasse et d'amour* (1597); *Kalendaræ Januariæ et Varia quædam Poemata* (1597), and commentaries on Tibullus, Catullus, and other Roman poets. His collected works were edited by Blanchemain in 1881 (Paris).

PASSERES, pás'sér-éz (Lat., sparrows), or **PASSERIFORMES.** The largest order of birds, nearly corresponding to the old order Insectores or perchers. The order takes its name from a typical genus (*Passer*) represented by the common house sparrow (q.v.). The Passeres are characterized by the possession of four toes, three in front and one behind, all inserted on the same level. The muscle that bends the hind toe is separate from the muscle which bends the other toes collectively; there is no ambiens, and no accessory femorocaudal muscle; the sternum has a single notch on each side behind; there are more than six secondaries and the rectrices are almost always 12; the palate is ægithognathous; there is a single carotid, the left; the oil gland is nude; there are two cæca; the upper cervical

feather tract is directly continuous with the dorsal tract, and the femoral tracts are weak; the young are hatched naked and helpless. More than half of all known birds are Passeres. They are found everywhere, and their habits, colors, food, songs, eggs, etc., show the greatest diversity. According to the structure of the syrinx, they are grouped as Clamatores (Passeres anisomyodæ), or as Oscines (Passeres diacromyodæ). Sharpe estimates in the order Passeriformes 61 families, 1488 genera, and 11,558 species and subspecies. Consult A. H. Evans, *Birds* (London, 1900).

PASSI, pás'st. A town of Panay, Philippines, in the eastern part of the Province of Iloilo, situated 24 miles north of Iloilo. Pop., 1903, 7578.

PASSING NOTES. See HARMONY.

PASSINI, pá-sé'né, LUDWIG (1832-1903). An Austrian water-color painter, born in Vienna. He was a son and pupil of the engraver Johann Passini (1798-1874), studied at the Vienna Academy under Führich and Kupelwieser, and finally devoted himself to painting in water colors under Karl Werner, with whom he traveled in Italy. After living in Rome and Berlin he settled in Venice, the artistic beauties of which he was the first painter to discover. Thenceforth he devoted his brush chiefly to those delicately fresh and natural delineations of Venetian life with which his name is associated as one of the most distinguished aquarellists of his day. Prominent examples of his work are: "Canons in St. Peter's, Rome" (1870, National Gallery, Berlin); "The Tasso Reader" (1872); "Pumpkin Venders in Venice" (1876, Vienna Museum); "Curious People on a Bridge" (1885, Breslau Museum); "Mass at Chioggia" (Metropolitan Museum, New York). Passini also painted excellent portraits.

PASSION, or PASSION MUSIC. From the earliest times it was customary in the Church to chant the story of the passion of Christ during Holy Week. As a musical art form the passion first appears in Germany about 1570. A little later Italy originated the form of the oratorio, and for the next half century no marked distinction appears between the two forms. Then the passion began to assume characteristic traits which distinguish it from the oratorio. These traits are the frequent introduction of chorales, the retention of the character of the "narrator" (which entirely disappeared from the oratorio), and the use of the chorus for contemplation and reflection upon the events related. See ORATORIO; SACRED MUSIC.

PASSIONATE PILGRIM, THE. A small collection of sonnets and lyrics by Shakespeare, Marlowe, Barnfield, and Raleigh, published by W. Jaggard in 1599. Shakespeare's name appeared on the title-page, but was evidently unauthorized, as it was dropped in later editions, and several of the poems were erroneously attributed to him.

PASSION CROSS (Lat. *passio*, suffering, from *pati*, to suffer). A cross supposed to reproduce the form and proportions of that on which Christ suffered, with a long upright and one or two short traverses near the top. It often bears the figure of Christ and is heavier in proportions than the resurrection cross, which also belongs to the type of the Latin cross. A passion cross, when elevated on three steps or degrees (said by heralds to represent the virtues of faith, hope, and charity), is called a cross Calvary.

PASSION-FLOWERS

PASSION FLOWER (*Passiflora*). A genus of about 300 species of mostly climbing plants of the family Passifloraceæ. The species, which are mostly natives of the warm parts of America, have alternate, simple, variously lobed leaves, from the axils of which tendrils are produced. The flowers are usually hermaphrodite, with generally a five-parted, fringed calyx and similarly segmented corolla. Several rows of filamentous processes spring from within the cup, which is formed by the consolidated calyx and corolla. The genus received its name from fanciful persons among the first Spanish settlers in America who imagined a representation of the Lord's passion, the filamentous processes being taken to represent the crown of thorns, the three styles the nails of the cross, and the five anthers the marks of the wounds. On account of the large and beautiful flowers, many of the species are cultivated in greenhouses; some are also grown in tropical countries for their fruit, particularly *Passiflora edulis*. *Passiflora foetida*, *Passiflora coccinea*, and *Passiflora lauriflora* are known as granadillas (see GRANADILLA). *Passiflora quadrangularis* is a larger edible species, called the large granadilla. One of the best-known species is *Passiflora carulea*, a native of Peru and Brazil, extensively grown for its beautiful white, pale-blue, or rose-colored flowers. Like most species, it succeeds in the open only in tropical and subtropical climates. Among the popular cultivated species are *Passiflora gracilis* and *Passiflora racemosa*. About a dozen species are natives of the United States, among which are *Passiflora incarnata*, the Maypop of the Southern States, a showy-flowered edible-fruited species. *Passiflora lutea* has greenish-yellow flowers and smaller fruits. The passion flower is propagated by seeds and by cuttings of the young wood.

PASSIONISTS. The name generally applied to the order whose full name is the Congregation of Discalced Clerks of the Holy Cross and Passion of Our Lord Jesus Christ, founded by St. Paul of the Cross (q.v.), who obtained permission of Benedict XIII to found a congregation in 1725. Their first permanent settlement was made on Monte Argentaro, near Genoa, in 1737; they received the first papal approbation as a society of mission preachers from Benedict XIV in 1741, and their rule, modified in some points, was again confirmed by Clement XIV in 1760, who four years later gave them the church of Saints John and Paul on the Cœlian Hill in Rome, now the headquarters of the order. The members take, besides the usual monastic vows, a fourth to remember and meditate continually upon the sufferings of Christ. Their work is principally the conversion of sinners, especially by preaching missions and retreats. Their habit is black, with a white heart-shaped piece of stuff sewed on the left breast, in which are represented the instruments of the passion—cross, nails, crown of thorns, etc. The general (*præpositus*) is elected by the general chapter for six years; each house has a rector, chosen for three years. The order has now 12 provinces and about 1400 members. In 1915 there were two provinces in the United States (to which they came in 1852), with about 200 professed priests and students.

PASSION PLAY. Plays representing the passion of Christ became numerous between the thirteenth and the sixteenth centuries, especially in Germany and the Tirol. The only survival is that which takes place every tenth year

in the village of Oberammergau in the Bavarian highlands. In 1633, as an act of gratitude for the cessation of the Black Death, which had desolated the surrounding country, the villagers vowed to represent the passion of Christ every 10 years and have ever since observed their vow. The inhabitants of this secluded spot, long noted for their skill in carving wood and ivory, have a rare union of artistic cultivation with perfect simplicity. The personator of Christ considers his part an act of religious devotion; he and the other principal performers are said to be selected for their holy life and consecrated to their work with prayer. The players, about 600 in number, are all villagers, who, though they have no artistic instruction except from the parish priest, act their parts with much dramatic power and a delicate appreciation of character. The Gospel narrative is closely followed; the acts alternate with tableaux from the Old Testament and choral odes. The oldest text in existence was written about 1600, and that now used was revised about the beginning of the last century. It was published in Munich in 1910, and an English translation was made by E. Childe (London, 1880). Short, *Ober-Ammergau* (New York, 1910); H. Diemer, *Oberammergau and its Passion Play* (London, 1910). See MYSTERY.

PASSOVER (trans. of Heb. *pesach*, a passing over, from *päsach*, to pass over). The first of the three chief festivals prescribed in the Pentateuch (Ex. xii; Lev. xxiii. 4-8; Num. ix. 1-14, xxviii. 16-25; Deut. xvi. 1-8). Its celebration begins on the evening of the fourteenth day of Nisan (corresponding to the older Abib) and lasts for eight days. The Jews associate the festival with the Exodus from Egypt, and this historical character was so impressed upon it as to obscure its original significance. Two festivals seem to have been combined in the Passover, viz., (1) a feast of unleavened bread known as *Masgôth*, and (2) a festival in which the chief rite was the sacrifice of a sheep within the family circle and the sprinkling of the lintels and doorposts of the houses with the blood. This sacrifice was called *pesach*. Of these two festivals the former is the old Canaanitish harvest festival, commemorative of the first ripening of the corn, which the Hebrews naturally adopted when they took possession of the Canaanitish soil. Thanksgiving offerings were made on this occasion to Yahwe as the "Baal," to whom the land belonged. Since the presentation of such gifts, consisting of the first-fruit sheaf, involved a visit to a Yahwe sanctuary, the occasion became a *hag*—the ancient Semitic designation for a mirthful festival with dances and processions at a sanctuary and a sacrificial meal as the symbol of communion between the god and his worshippers. It was customary at this festival to eat only unleavened bread, which merely represents the usual food during the harvest season, when the people, busy with field labors, did not take time to wait in baking their bread until the completion of the slow process involved in the leavening of the dough; hence the festival became known as the *hag ha-masgôth*, i.e., the festival of unleavened bread. On the other hand, the sacrifice of the *pesach* stands in no connection with agriculture. It is considered by

some scholars as originally a rite of propitiation or lustration observed during a pestilence or on some other special occasion. It consisted in sprinkling with blood the entrance to the house (or tent), which was particularly sacred. It is still customary among the Bedouins to sprinkle their camels and flocks with blood as a protection against the ravages of a pestilence. This blood rite, from being indulged in on extraordinary occasions, became a regular custom observed in the spring, the bearing time of the flocks, when it became especially important to secure the protection of the deity. Other scholars have recently maintained that *pesach* originally was the festival of the vernal full moon. They point out that the *pesach* offering is to be slaughtered in the evening, "when the sun has set" (Deut. xvi. 6), that all the meat must be eaten during the night before the rising of the sun (Ex. xxxiv. 25, xxiii. 18; Deut. xvi. 4 ff.), and that this festival night is that from the fourteenth to the fifteenth of Nisan, consequently the night of full moon in the spring month. These two festivals—one belonging to the agricultural stage, the other either a survival of the nomadic stage or more probably a vernal full-moon festival likewise taken over from the former inhabitants of Palestine—were in course of time brought into connection with the Exodus from Egypt and combined with each other. The combination once made, there resulted a series of ceremonial observances which gradually assumed the elaborate character of the Jewish Passover festival. The sprinkling of the blood became the symbol of the protection granted the Hebrews by Yahwe at the time that pestilence struck the Egyptian households. The sacrificial lamb and the unleavened bread were also brought into connection with the Exodus—the former pictured as a ceremony indulged in on the eve of the departure of the people, the latter a symbol of the "haste" with which the deliverance was brought about, so that the people did not have time to bake bread from leavened dough. In later Judaism the historical association was still further emphasized, and there grew up an elaborate service for the eve of the Passover, known as the *seder*, the chief features of which were the recalling of the Exodus by reciting the narrative in the household, the preparation of dishes symbolizing the affliction and hardships of the people in Egypt, together with thanksgivings and songs of praise accompanied by benedictions over wine for the miraculous deliverance. For eight days unleavened cakes are eaten, and no food prepared of any leaven material is to be eaten. In fact, all traces of leaven are to be removed out of the house, and in orthodox Jewish households separate sets of dishes are used during the eight days of the Passover. In the Christian Church the paschal lamb became preëminently the type of the sacrifice of Christ.

Bibliography. mias, *Das alte Testament im Lichte des alten Orients* (2d ed., Leipzig, 1906; Eng. trans. by C. L. Beaumont, 2 vols., New York, 1911); Benzinger, *Hebräische Archäologie* (2d ed., Tübingen, 1907).

PASSOW, päs'só, FRANZ (1786–1833). A German philologist. He was born at Ludwigs-lust, studied at Leipzig, and was called in 1807 to the chair of Greek in the Weimar Gymnasium and in 1815 to that of ancient literature in the University of Breslau. His principal work is his important *Handwörterbuch der griechischen Sprache* (2 vols., 1819; 4th ed., 1831; complete revision by W. Crönert, Göttingen, 1912 et seq.). He also published *Grundzüge der griechischen und römischen Literatur- und Kunstgeschichte* (2d ed., 1829) and other volumes. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

PASSPORT (Fr. *passeport*, from *passer*, to pass + *port*, Lat. *portus*, port, harbor). A written instrument issued by the authority of a government for the identification and protection of its citizens when traveling abroad. It is, first, a certificate of the citizenship of the bearer and, second, a formal permit authorizing him to leave the state of which he is a subject. The origin of the practice of granting passports grew out of the right of nations, which was formerly more frequently exercised than now, to withhold from foreigners the right of transit through their territory. The formal permission granted to a foreigner by a government to pass through its territory was a passport. To avoid the inconvenience of this requirement the practice was adopted by which a subject of one government leaving his country for travel in another obtained from his government a certificate of citizenship which was accepted by the other government as a passport. This is presented to the foreign government as an identification of the bearer, who, instead of receiving a passport from the foreign government, is given permission to pass through by the act of an officer in putting a *visé* upon the certificate itself. At present Russia, Turkey, Portugal, and Greece are the only European countries where travelers cannot travel freely without passports, though some of the German states require certification for the purpose of police protection, where parties desire to reside for a considerable period in one place. In the United States passports are issued only by the Department of State and only to citizens upon application supported by proof of citizenship. No distinction is made between native-born and naturalized citizens in the granting of passports. The fee is \$1, and a passport for the head of a family includes the wife and minor children. In foreign countries they may be obtained by citizens of the United States only by the chief diplomatic representative or by the consul general or, in the absence of both of these officers, by a consul. A fee of \$5 is allowed to be charged for each passport granted to a citizen of the United States abroad by a diplomatic representative. An application to a diplomatic officer for a passport by a native citizen must be accompanied by a written declaration under oath stating the name, age, and place of birth of the applicant, supported if possible by the affidavit of a creditable person to whom the applicant is personally known. If the applicant claims to be a naturalized citizen he must produce a copy of the decree of the court by which he was naturalized. In both cases an oath of allegiance is

required for transmission to the Department of State. Every such passport to be valid must be renewed either at the Department of State or at a legation of the United States abroad at the expiration of two years from its date. Passports are not granted to aliens who have declared their intention to become citizens of the United States, although they may obtain authenticated certificates of their declaration of intention, which entitle them to a qualified protection while traveling abroad. Nor are they granted to naturalized citizens who may be inferred from long residence abroad and other circumstances to have abandoned their nationality. The chief value of a passport is that it provides the holder with authentic proof of his national character and frees him from inconveniences which he might otherwise experience while traveling in foreign lands. If lawfully issued it is *prima facie* evidence of citizenship, and as such must be respected not only by the administrative officers, but by the courts of the government where the holder may be sojourning; but it furnishes no exemption from the jurisdiction of the country in which he may be. It is nothing more than a request to foreign governments to admit the bearer to the enjoyment of the rights and privileges to which he as citizen of the country issuing the passport may be entitled by treaty or convention.

In some European states no subject is allowed to depart therefrom without first securing a passport from his government authorizing him to leave the country. Where this rule prevails the passport is required to be countersigned by the minister or consul of the country which the bearer visits. In time of war passports or safe conducts are frequently granted by military commanders to allow persons to pass through the lines or to insure the safety of officers while in the performance of some duty which takes them beyond the lines. They may also be granted for the passage of goods as well as for individuals. Diplomatic representatives upon departing from a state in which they have been residing usually demand and receive passports to enable them to withdraw in safety.

PASSY, *pa'sé'*, FRÉDÉRIC (1822-1912). A French political economist and statesman, the father of Paul Passy. He was born in Paris. Establishing himself as a lawyer, in 1846 he was appointed auditor to the Council of State. He entered politics, but the proclamation of the Second Empire caused him to withdraw because of unwillingness to countenance the coup d'état of Louis Napoleon. From 1860 to 1863 he delivered free lectures, in various French cities, on social-science topics. In 1868 he founded the International League of Peace. After the fall of the Second Empire he reentered political life and from 1874 to 1889 represented various departments in the Chamber of Deputies. From this time on he devoted all his energies to the cause of pacifism. In 1887 he helped Sir W. R. Cremer (q.v.) to found the Interparliamentary Union to promote arbitration and peace. He had been elected to the Academy of Moral and Political Sciences in 1877, and was also a member of the International Permanent Peace Bureau at Bern. In 1901 he shared with Henri Dunant the first Nobel peace prize. In May, 1912, the members of the principal societies of political economy met at the Sorbonne to celebrate his ninetieth birthday and the seventieth of his presidency of the Society of Political Economy,

but Passy himself was unable to attend because of failing health. By this time he had become completely blind. He wrote, in addition to numerous articles in reviews: *Mélanges économiques* (1858); *Leçons d'économie politique* (1860-61); *La question des octrois* (1866); *La guerre et la paix* (1867); *Communauté et communisme* (1869); *De l'importance des études économiques* (1873); *La solidarité du travail et du capital* (1877); *L'Histoire et les sciences morales et politiques* (1879); *L'Héritage du XIXe siècle* (1900); *Historique du mouvement de la paix* (1905).

PASSY, PAUL EDOUARD (1859-). A French phonetician, son of Frédéric Passy, born at Versailles. After teaching in the Normal School of Auteuil he was elected in 1894 assistant director of the Ecole des Hautes-Etudes at Paris. His works deal principally with pedagogy and with general and comparative phonetics. He founded the Association Phonétique des Professeurs de Langues Vivantes, and later the Association Phonétique Internationale, being the principal originator of the alphabet now almost universally used by phoneticians. His works include *Le français parlé* (1886; 6th ed., 1908); *Les sons du français* (1887; 7th ed., 1913; Eng. trans. by Savory and Jones, 1907; 2d ed., 1914); *Etude sur les changements phonétiques* (1890); *Elementarbuch des gesprochenen Französisch* (2 vols., 1893), with F. Beyer; edited *L'Origine des Ossalois*, by his brother Jean Passy, who died in 1898 (1904); *Dictionnaire phonétique de la langue française* (2d ed., 1914), with Michaelis; *Petite phonétique comparée des principales langues européennes* (2d ed., 1912); *Abrégé de prononciation française* (3d ed., 1906); *Choix de lectures françaises phonétiques* (1904); *Lectures variées mises en transcriptions phonétiques* (2d ed., 1909); and the *International French-English and English-French Dictionary* (1904), with G. Hempl.

PASTA, *pà'stà* (née NEGRI), GIUDITTA (JUDITH) (1798-1865). An Italian singer and one of the most distinguished opera sopranos of modern times. She was born near Milan and received her musical education partly at Como, under the chapelmaster of the cathedral there, and partly in the conservatory at Milan. After 1811 she appeared at various theatres of the second rank in northern Italy. Her first great triumph was achieved at Verona in 1821. The year following she was engaged at the Paris Italian Opera, where her singing excited great admiration. From 1825 to 1830 was the period of her greatest triumphs, which were won principally in London and Paris. Vienna, where she accepted an engagement in 1832, witnessed the last. Some time afterward she practically withdrew from the stage and purchased a villa on the banks of Lake Como. Her last appearance occurred in London in 1850, but then her voice was seriously impaired. She had a magnificent voice, which easily passed from clear, shrill soprano notes to the gravest contralto tones, besides which she had great dramatic energy and a stateliness of manner that suited lofty and imposing characters. Her principal rôles were in *Medea*, *Desdemona*, *Semiramide*, *La Sonnambula*, and *Norma* (these operas were written for her by Bellini), and *Giulia* in *Romeo e Giulia*. Donizetti and Pacini also wrote operas for her.

PASTE. A substance composed of various agglutinants applied to paper, leather, etc., to cause them to adhere to similar surfaces or to

cardboard, fabrics, a plastered wall, or other unlike materials. It is commonly made of starch, flour, and gelatin in proportions varying with the uses to which it is to be put. An essential oil is sometimes added to prevent fermentation and overcome any objectionable odor. For paper hanging and bookbinding pastes are made by cooking wheat or rye flour, to which glue and sometimes silicate of soda are added. For photographic mounting starch is often the chief constituent, a useful mountant being made by mixing one part of good white starch with two or three parts of cold water to form a smooth, creamlike paste, which, with constant stirring, is poured into six to eight parts of boiling water. Heat for five minutes, stir, and strain. Ordinary starch paste will keep for only two or three days, but oil of cloves or a few drops of carbolic acid will preserve it much longer. Another formula in common use for mounting photographs is: Soak 1 ounce gelatin in 10 fluid ounces alcohol; to this add $\frac{1}{2}$ to 1 ounce glycerin and dissolve by gentle heating. Another recipe for office, library, or photographic purposes is: Gum tragacanth, 2 ounces; white dextrin, 1 ounce; wheat flour, 6 ounces; glycerin, 1 ounce; when dissolved in 4 ounces cold water add 40 ounces boiling water and stir until of uniform consistency. Polishing paste for polishing brass, copper, nickel, and other metallic surfaces is made of finely ground pumice, talc, or infusorial earths combined with some oil as a vehicle.

PASTE EEL. See EELWORM.

PASTEL, pás-tél' (Fr. *pastel*, from Lat. *pastillus*, little roll, lozenge, dim. of *panis*, loaf, bread). A mixture of chalk with pigments, bound together with gum water or some other medium into a sort of paste. This is dried into small cylinders or stocks, with which the design is drawn on rough paper, cardboard, or specially prepared canvas. It is drawn either with the point or the edge of the stick, as in other crayon drawing, or with the side of it, in which case the color is spread with the aid of the finger tips, sometimes even of a brush. As the pigment is spread on the paper or canvas in the form of a dry powder, not all of which adheres, pastels are easily damaged. This is often guarded against by the use of a fixative, a kind of varnish—a practice esteemed undesirable because it darkens the color. If carefully protected from dust, sunlight, and damp, a pastel will preserve its freshness longer than any other medium (witness the French pastels of the eighteenth century), never darkening like oil or absorbing moisture like water color. Its special beauty consists in the soft velvety surface, giving a bloom and depth of color harmonies not otherwise obtainable. As its chief qualities are freshness and charm, it is not adapted to the grand style of painting, to historical or religious subjects, but rather to portraits, still life, and to certain varieties of genre and landscape painting. It is the medium of the colorist rather than the draftsman and offers great facility to the rapid workman.

History. Drawings in colored chalk were used in Italy as early as the fifteenth century, chiefly as studies for paintings. During the sixteenth century the practice increased, in Italy as in other countries, e.g., Holbein's wonderful drawings are often touched with color. But these earlier efforts are not properly pastel, which did not become an independent art until the second half of the seventeenth century. In Ger-

many Thiele (1685-1752), to whom the invention of pastel has been attributed, was the first to perfect the art, and he was followed by Anton Raphael Mengs (q.v.), Johann Heinrich Schmidt, and others. Rosalba Carriera (q.v.) (1675-1757) was easily the first artist of Italy, and one of the foremost of Europe, in this medium. But it was in France during the eighteenth century that pastel reached its highest perfection. It has been appropriately identified with the fragile beauties of the rococo and found expression in a series of inimitable portraits. The chief master was Quentin de la Tour (q.v.) (1704-88), but about him gathered a galaxy of important masters—Chardin, Lancret, Greuze, Boucher, Vigée Le Brun (q.v.), Louis Tocqué, Perronneau, Vivien, and others. Liotard, the Swiss, and Roslin (qq.v.), the Swede, are also best classed with the French school of the eighteenth century. The earliest English pastelists of note was John Riley (1640-91), the most prominent John Russell (q.v.) (1745-1806). The art was practiced also by a number of the miniaturists, such as Cosway, Engleheart (qq.v.), and others.

During the nineteenth century pastel painting was in abeyance until the seventies, since when it has again come into vogue. As in the eighteenth century, the most important development has been in France, which was also the first to revive the art. Among recent French artists prominently identified with pastel painting are Fantin-Latour, Degas, Raffaelli, Charles Leandre, Gaston La Touche, Besnard, and Jules Cheret. In Belgium the art was successfully practiced by Emile Wauters and Khnopff; in Germany by Friedrich von Lenbach, Max Liebermann, and Franz Stuck; in England by McLaren Hamilton, J. J. Shannon, Walter Crane, W. J. Rothenstein, and others. Among American artists pastel was first used with success by Whistler, then by William Chase, James Alden Weir, Thomas W. Dewing, Robert Blum, J. Wells Champney, and Mary Cassatt. Other American masters of this technique are Everett Shinn, whose genre scenes of New York life are well known; Colin Campbell Cooper, Albert Sterner, Jerome Myers, W. J. Glackens, and George Bellows. Consult: Karl Robert, *Le pastel* (Paris, 1890); Julius Ritscher, *Anleitung zur Pastellmalerei* (4th ed., Dresden, 1900); Haldane Macfall, *French Pastellists of the Eighteenth Century* (New York, 1909); R. R. M. See, *English Pastels, 1750-1830* (ib., 1911); also the biographies of the artists mentioned.

PASTERNAK, pás'tér-nák, LEONID OSSIPOVITCH (1862-). A Russian genre and portrait painter and draftsman. He was born in Moscow and studied at the Munich Academy under Herterich and Liezen Meyer. He is perhaps best known for his charming drawings in black and white and in color, his specialty being scenes from the nursery and family life; but his "Students before Examination," in the Luxembourg, Paris, and "Tolstoy in his Family Circle" and "A Professional Meeting," both in the Alexander Museum, St. Petersburg, bear witness also to his high rank as a painter. His art is essentially pictorial, intimate, and realistic, full of warm feeling which never degenerates into sentimentality, and his technique is brilliant and varied. He illustrated the works of Tolstoy and other Russian authors. Pasternak became professor at the Moscow Art School. He received gold medals at Munich (1897) and Paris (1900).

PASTEUR, pás'tér', Louis (1822-95). A celebrated French biological chemist and pathologist, born at Dôle (Jura), Dec. 27, 1822. He early devoted himself to the study of chemistry, graduating from the Ecole Normale, Paris, in 1847. In 1848 he became professor of physics at Dijon and in the following year accepted the professorship of chemistry at Strassburg. In 1854 he was called to Lille as dean and professor of chemistry in the faculty of sciences. Here he remained until 1857, when he went to Paris as scientific director of the Ecole Normale Supérieure and was elected a member of the Institute. In 1863 he became professor of geology, physics, and chemistry at the Ecole des Beaux-Arts and from 1867 to 1889 was professor of chemistry at the Sorbonne. Later he carried on his researches at the Institut Pasteur, Paris, of which he was director until his death and where he was surrounded by such men as Calmette, Chamberland, Metchnikoff (q.v.), Yersin, and Roux (q.v.), who became his successor. He died near Saint-Cloud, Sept. 28, 1895.

The results of Pasteur's investigations have formed contributions of the highest importance to nearly every branch of physical and natural science. By his classical researches on optically active substances and their separation into isomeric modifications of identical chemical but different physical properties, Pasteur became the founder of the science of stereochemistry (q.v.). In the province of fermentation and the germ theory his work was even greater. He showed that lactic, butyric, acetic, and other fermentations are caused by microorganisms, and established on a firm scientific basis the principle that spontaneous generation cannot take place, at least under ordinary conditions. The different processes of putrefaction and fermentation set up by the air are invariably produced by germs, the presence of which in the atmosphere Pasteur demonstrated by passing a current of air through guncotton and dissolving the latter in a mixture of alcohol and ether; an insoluble residue was thus obtained, in which the germs of organisms could be readily seen with the aid of a microscope and could be shown to be capable of developing into mature organisms. See MILK PRODUCTION; PASTEURIZER.

Pasteur's studies on the diseased conditions of wine and beer have rendered possible and easy the prevention of these conditions. No less important were his investigations on the silkworm's disease pébrine and its cure. His discovery of bacteria as the cause of anthrax (splenic fever) in cattle was epoch-making in the science of diseases. Similar results were obtained with regard to fowl's cholera; and his experiments show success in preventing the various diseases caused by septic bacteria by inoculating animals with a milder form of the disease by means of a weaker brood of bacteria artificially cultured. Pasteur found that by keeping a cultured crop of specific microorganisms at a certain temperature with a full supply of oxygen he could reduce organisms to an incapacity for producing spores, therefore to sterility. But before this point is reached the cultured organism loses its virulence, although still germinating; vaccination with it then produces a mild disease, which effectually protects from the fatal scourge of splenic fever, of fowl's cholera, and other diseases.

In the same manner he dealt with splenic apoplexy, which he showed to be caused by the

presence of specific bacteria in the blood. Pasteur's well-known treatment of hydrophobia is based on a similar principle, the spinal column of the infected animal serving as culture medium. See HYDROPHOBIA.

Besides important articles in the *Annales de Chimie*, his writings include: *Nouvel exemple de fermentation déterminée par des animalcules infusoires pouvant vivre sans oxygène libre* (1863); *Etudes sur le vin, ses maladies, causes qui les provoquent* (1866); *Etudes sur le vinaigre, sa fabrication, ses maladies, moyens de les prévenir* (1868); *Etudes sur la maladie des vers à soie* (1870); *Nouvelles études sur la maladie des vers à soie, etc.* (1871); *Etudes sur la brève* (1876; Eng. trans., *Studies on Fermentation*, 1879); *Les microbes* (1878), jointly with Tyn-dall; *Sur les maladies virulentes et en particulier sur la maladie appelée vulgairement choléra des poules* (1880; Eng. trans., *The Attenuation of the Virus of Fowl Cholera*, 1886); *Résultats de l'application de la méthode pour prévenir la rage après morsure* (1886; Eng. trans., *Researches on Vaccination for Rabies*, 1886); *Nouvelle communication sur la rage* (1886); *Le traitement de la rage* (1886; Eng. trans., *Rabies*, 1890). Consult: Bournand, *Un bienfaiteur de l'humanité: Pasteur, sa vie, son œuvre* (Paris, 1896); C. A. Herter, *The Influence of Pasteur on Medical Science* (Baltimore, 1904); René Val-lery-Radot, *Life of Pasteur*, English translation by Mrs. R. L. Devonshire (2 vols., London, 1911); Stephen Paget, *Pasteur and after Pasteur* (ib., 1914); Keim and Lumet, *Louis Pasteur*, English translation by F. C. Cooper (New York, 1914), containing a bibliography.

PASTEUR INSTITUTES. Laboratories at which the Pasteur method of treatment of hydrophobia is employed. See HYDROPHOBIA.

PASTEURIZER, pás'tér-iz'ér. An apparatus for preserving by means of heat wines, milk, and other solutions from deterioration. The term is derived from Pasteur (q.v.), the French bacteriologist, who first showed the application of heat in killing the microorganisms which cause souring and other changes in wine. In Pasteurization a temperature which destroys or inhibits the growth of bacteria is employed, varying from 130° F. to 160° F. or higher and continued from 10 minutes to a half hour, whereas in sterilization boiling is used and often repeated. Continuous Pasteurizers are employed in creameries and milk-bottling establishments, the heat being supplied by steam and a continuous stream of the milk passing through the apparatus. See MILK PRODUCTION.

PASTICCIO, pá-stét'chó (It., medley). In music, a term applied to works that are patched up from various earlier works of a composer. In the eighteenth century operatic composers did not always trouble themselves to compose new music to a new text. They took arias or choruses from their other earlier operas and adapted them to a new text. Handel made liberal use of this inartistic device, even in some of his best works. Thus the famous chorus from the *Messiah*, "For unto us a child is born," is not original, but the music is taken note for note from a madrigal composed by Handel himself in 1712.

PASTILLES, pás-tél'z'. See TROCHES.

PASTO, pás'tó. The capital of the Department of Nariño, Colombia, near the border of Ecuador and 120 miles northeast of Quito (Map: Colombia, B 3). It is situated at an altitude

of 8650 feet in the midst of a large plain at the foot of the volcano of the same name. The town is well constructed, with broad, well-paved streets and many fine private residences. The educational institutions are the University of Nariño, a normal school, and a number of private schools. The town is an episcopal seat. It has manufactures of woolen blankets, hats, and decorated pottery. Pop., 1912, 27,760. Pasto was founded by Pizarro in 1539. It was twice burned during the wars of independence and ruined by an earthquake in 1834, in which 10,000 people perished.

PASTON LETTERS. The correspondence of the Paston family in Norfolk, England, including over 1100 letters, together with a few state papers which came into the family's possession. The letters cover the years 1422-1509 and are of the utmost value as affording us our only glimpse into the public and private life of the time. They were first published by Sir John Fenn in five volumes (London, 1787-1823), the last volume appearing by another hand after the principal editor's death. The disappearance of the manuscripts after their publication naturally led to doubts as to their genuineness. Gairdner defended their authenticity on the grounds of internal evidence, and the soundness of his argument was completely proved by the subsequent reappearance of several volumes of the lost manuscripts. He also prepared an admirable edition of the letters in three volumes (London, 1872-75; reprinted in 1896), with an introduction containing a full history of the Paston family. A new edition by the same editor, containing 105 new letters, appeared in four volumes (London, 1900-01) and another edition in six volumes in 1904.

PASTOR (Lat., shepherd; so called because frequently seen near flocks of sheep). The popular as well as the generic name of certain birds of the starling family (Sturnidae). They differ from starlings in the compressed and slightly curved bill. In habits, as in structure and food, the groups are very similar. (See OXPECKER.) They are confined to the Old World, and especially to the Orient, though one species, the rose-colored pastor, or rose starling (*Pastor roseus*), glossy black with pink back and abdomen, is occasionally seen (sometimes in vast flocks) about the Mediterranean. It is not only a very handsome bird, but is very useful, especially where locusts occur, as the pastors eat the young locusts greedily and are for this reason sometimes called locust birds (q.v.). In India the species is numerous and familiar and is included with the mynas. See Plate of LAKE AND STARLINGS.

PASTOR, päs'tör, LUDWIG (1854-). A German historian, born at Aix-la-Chapelle. He studied at the universities of Bonn, Berlin, and Vienna, became instructor at Innsbruck in 1880 and professor of history there in 1886. In the preparation of his historical works he made extensive research in the archives of Germany, France, and Italy, particularly those of the Vatican, first made accessible by Leo XIII. His chief publication is his *Geschichte der Päpste seit dem Ausgang des Mittelalters* (1886-95; 4th ed., 1899-1901; Eng. trans., London, 1891-98), an extensive and thorough history of the papacy from the close of the Middle Ages. Other volumes by him are *Die kirchlichen Reunionsbestrebungen während der Regierung Karls V.* (1879) and *Die Korrespondenz des Kardinals Contarini*

während seiner deutschen Legation (1880). He revised vols. i-vi of Janssen's *Geschichte des deutschen Volkes* (1903-07) and edited vols. vii and viii of the same work (14th ed., 1903).

PASTOR, TONY (ANTONIO) (c.1835-1908). An American theatrical manager, born in New York City. In 1843 he was featured as a "child prodigy" at P. T. Barnum's Museum, then traveled with circuses and minstrel shows, appeared as a singer at the Bowery Music Hall, New York, in 1859, managed a concert hall in 1861-65, and was proprietor of a variety theatre on the Bowery in 1865-75 and of one on Broadway in 1875-81. Thereafter until his death he managed Tony Pastor's Theatre in the building of Tammany Hall, New York. Pastor is generally considered the originator of modern vaudeville, and many successful comedians appeared under his management.

PASTORAL EPISTLES. A subgroup in the collection of New Testament letters which in their several addresses claim to have been written by the Apostle Paul. They comprise the following three writings: 1 Timothy, 2 Timothy, and Titus. They are called pastoral because of the rather unusual character of their contents, as compared with the Apostle's other letters, being addressed to helpers of the Apostle whom he had left in pastoral care of certain fields, and whom he wished in these communications to instruct regarding the duties involved in their charges. See the article on the individual Epistles.

PASTORAL POETRY (Lat. *pastoralis*, relating to a shepherd, from *pastor*, shepherd). A kind of poetry in which the incidents, thoughts, and emotions of cultivated society are presented under the disguise of rustic life. The characters are shepherds and shepherdesses, in a setting of valley and hillside, and the usual theme is love. This artificial literary genre flourished in antiquity and for centuries throughout western Europe. The oldest extant forms are the idyl and the eclogue, but the pastoral motive may enter the romance and the drama.

Antiquity. The pastoral undoubtedly takes its root far back in Greek literature. According to *Ælianus* (*Varia Historia*, x, 18) its inventor was Stesichorus of Himera in Sicily (who died about 555 B.C.); and his subject was the blindness of Daphnis, afterward the typical lovelorn shepherd. According to the ancient grammarians it originated in the rustic cult of Artemis at Syracuse (*Scholion* upon Theocritus). These traditions certainly point to very old folk songs now lost. The extant pastoral dates from Theocritus, who flourished about 270 B.C. at the courts of Syracuse and Alexandria. To him are attributed 31 idyls (little pictures of life), of which 10 are strictly bucolic. Here first occur Thyrsis, Tityrus, Corydon, Damoetas, Daphnis, Lycidas, Menalcas, and Amaryllis, names since made familiar to western Europe. Theocritus seemingly reproduces the language of the peasants, their melodies, superstitions, and custom of answering one another in verse. His idyls are short descriptive lyrics combined with little dramatic pieces, sometimes comic, like the mimes which had been popular in Sicily since Sophron (fl. 440 B.C.). The poet introduces himself under the name of Simichidas and devotes an idyl to his patron Ptolemy Philadelphus of Alexandria, and another to Hiero II of Syracuse. Theocritus was followed by two poets: Bion of Smyrna, known for his beautiful *Lament for*

Adonis, and Moschus, author of the still more beautiful *Dirge* for Bion. Several centuries later an unknown Greek writer told the story of *Daphnis and Chloe* in prose. The theme of the romance is artless innocence; its tone is sensuous and decadent. The pastoral poem had already been adapted to Italy by Vergil (died 19 B.C.). However much Theocritus may have idealized his country scenes, he yet had nature before his eyes. The purely artificial pastoral began with Vergil, who took his notes not so much from nature as from Theocritus. Vergil composed 10 graceful bucolics, which he called *eclogæ* (i.e., selections). Like Theocritus, he wove into them incidents from his own life. From Vergil the pastoral motive spread to Horace, Catullus, and other Roman poets and eventually throughout western Europe.

Italy. The pastoral of the Renaissance did not spring from Vergil alone. To it contributed the *pastourelles*, love songs with a rustic setting, which were cultivated in various countries of southern Europe in the thirteenth century. They especially flourished in Provence as early as the twelfth century, whence they were largely diffused. They were in no way connected with Vergil, but they seem to have had their source in folk song. In the fourteenth century the two streams of influence—the native and the classic—united to form the modern pastoral. The Vergilian revival first took the form of allegories, in which the learned addressed Latin epistles to one another under pastoral names. Eclogues of this kind passed between Dante and Giovanni del Virgilio, professor of Latin at Bologna (c.1320). Dante figures as Tityrus and his friend as Mopsus. Petrarch (1304–74) also composed a pastoral in 12 eclogues, in which he worked out an elaborate allegory. Dante and Petrarch thus mark the reappearance of Vergil as a literary force. Boccaccio (1313–75) blends the ancient and the indigenous pastoral. He wrote Latin eclogues much in the manner of his great compatriots. His *Ameto* (1342) is the first pastoral romance in the vernacular. He took as his model the song fable in which prose is employed for the narrative and verse for the expression of the feelings. Under the names Caleone and Fiammetta, Boccaccio veiled his passion for Maria, natural daughter of King Robert of Naples. The *Ameto*, with its disguised personal history and cross loves, is the prototype of the later Italian pastoral romances, of which a famous specimen is the *Arcadia* (1504) by Jacopo Sannazaro. Another aspect of the pastoral, which indeed is found in Petrarch, was rendered by Baptista Spagnolus, generally known as Mantuan (died 1516), whose works were Englished by George Turberville in 1567. His rustics were made a medium for fierce satire on women, the court, and the Church. Attention has already been called to the dramatic element in the pastoral as early as Theocritus. When the popularity of the mediæval mystery play began to wane, the pastoral drama, easily expanded from the eclogue, was one of the forms that took its place. Even in Boccaccio's *Ninfale Fiesolano* the pastoral begins to assume a dramatic turn. But the first distinctive pastoral drama is the *Orfeo* of Poliziano, a sort of opera given at Mantua in 1372. It is founded on the story of Orpheus and Eurydice. During the next century many similar pastorals were produced at the Italian courts. By far the best of them is the *Aminta* of Tasso, performed at

Ferrara in 1573. Equally well known in its own time was the *Pastor Fido* of Guarini (1590).

Spain. In the Spanish peninsula the native pastoral songs counted for much more than elsewhere. As early as 1300 the *pastourelle* was cultivated at the court of Dom Diniz, King of Portugal. And in Spain proper the Christmas mystery play, performed by real shepherds, was in fact a pastoral. The way was thus prepared for Juan de Encina (died 1534), who, besides translating Vergil's eclogues, composed pastoral pieces for recital (c.1492) before audiences at the house of the Duke of Alba. To this time belong also the pastoral lyrics by Garcilaso de la Vega (died 1536), one of Spain's greatest poets. Under Italian influences the pastoral romance made its appearance with the *Menina e Moça* (Girl and Maiden) of the Portuguese Ribeiro (died 1550). It was followed by the more famous *Diana* (c.1559) of Montemayor, a Portuguese by birth who chose to write in Spanish. For Spain the pastoral sentiment received most refined expression in the *Galatea* (1584) of Cervantes.

France and Germany. In southern France the pastoral love song goes back to the twelfth or thirteenth century. At the outset this kind of poetry belonged to the country folk, who sang it especially in May, but it early became a stereotyped artistic form. A knight, happening to come where a shepherdess is, makes love to her, but he is usually dismissed. This is the theme of all. No pastorals of genuinely popular design have survived. The pastoral soon appeared in northern France. From the beginning of the thirteenth century the French *pastorelle* strongly influenced that of Provence. The shepherd Robin or Robert was adopted in the south, and Marion, too. The old theme blooms charmingly in the *Jeu de Robin et de Marion* (c.1283) by Adam de la Halle. Though the song fable of *Aucassin et Nicolette* (c.1225) contains delightful rustic scenes, it is hardly a true pastoral. During the sixteenth century the pastoral disguise was sometimes employed by the poets. Clément Marot (died 1544) addressed an eclogue to the King, in which he described the course of his life under the symbol of the four seasons. The pastoral ideal, enforced by translations of the Italian *Arcadia*, the Spanish *Diana*, and the Greek *Daphnis and Chloe*, culminated in the *Astrée* (1610–25) of Honoré d'Urfé (q.v.), an immense prose romance. Here the bucolic life reached its extreme idealization. The nymphs appear in gilded buskins, arms adorned with bracelets, and heads covered with garlands of pearls. From the *Astrée* the pastoral made its way into Germany, where it flourished for more than a century. Of the German pastorals may be cited the *Hercynia* of Opitz (1622), the *Daphnis* (1754) and the *Idyllen* (1756) of Gessner, the *Luise* (1794; and complete, 1795) of Voss, and Goethe's *Hermann und Dorothea* (1797), in which the idyl returned to the truthfulness and simplicity of Theocritus.

England. Before the sixteenth century there was nothing beyond the realistic treatment of the shepherd scenes in the religious drama, and *Robene and Makyn* of Robert Henryson (died c.1500), written in Scottish. The pastoral on the continental model made its first English appearance in the six dull eclogues of Alexander Barclay (died 1552). They closely resemble the work of Mantuan. In 1563 appeared eight equally dull eclogues by Barnabe Googe. To

Tottel's Miscellany (1557) Surrey contributed two beautiful pastoral songs in the Italian manner. The important date for the English pastoral is 1579, when Edmund Spenser published the *Shepherd's Calendar*, the best English pastorals. In 12 eclogues under this title Spenser handles the leading motives—allegory, satire, and love. During the next quarter of a century English literature became saturated with pastoral sentiment. In all the great writers lived the image of a "golden world" somewhere in Arcadia or the Forest of Arden. The pastoral poem was cultivated in many lyrics, of which may be cited Marlowe's *Passionate Shepherd*, and in many collections, as *Britannia's Pastorals* of William Browne and the *Eclogues* of George Withers. Of romances inspired originally by Italy and Spain, the most typical is Sir Philip Sidney's *Arcadia* (1590), which had many imitators. There was, moreover, another large group of romancers, at the head of whom stood Robert Greene and Thomas Lodge, the authors respectively of *Menaphon* (1589) and *Rosalind* (1590). Undying charm was given to the pastoral ideal by Fletcher, Ben Jonson, and Shakespeare, in *The Faithful Shepherdess*, *The Sad Shepherd*, and *As You Like It*. A generation later Milton placed the masque in an exquisite pastoral setting and composed his great dirge in the manner of Moschus (*Comus* and *Lycidas*). After Milton the English pastoral fell into sad ways. The pastorals of Pope and Ambrose Philips, each published in 1709, are utterly conventional. Their imagery, when not borrowed, is either false or so general as to convey nothing. In ridicule of Philips, John Gay professed to depict rustic life with the gilt off. His *Shepherd's Week* (1714) probably comes somewhere near country manners. William Shenstone wrote several pretty ballads, in which appear Strephon and Chloe. We come to something better in Allan Ramsay's *Gentle Shepherd* (1725), a genuine picture of Scottish rural life. Later in the eighteenth century the pastoral was fused with other forms of descriptive poetry and hardly existed as an independent species. The pastoral elements may, however, be uncovered. For example, the summons from the city to the country, so frequent in Cowper, is a motive of Spenser. And the lyrics of Burns, many of them, are pastoral songs. The Vergilian type of pastoral has become thoroughly discredited. But several of the greatest English poets in the nineteenth century drew upon the Sicilian idyllists. There they found truth, grace, and charm. The two finest dirges since Milton, Shelley's *Adonais* and Arnold's *Thyrsis*, go back to Bion and Moschus. Pastoral themes were beautifully rendered by Landon in some of his *Hellenics* (1847), e.g., "The Hamadryad." Theocritus is easily discovered in Tennyson's *Dora* and *The Miller's Daughter*.

Bibliography. Material for the history of the pastoral is scattered. Consult: Andrew Lang (trans.), *Theocritus, Bion, and Moschus*, in "Golden Treasury Series" (New York, 1880); Gaspary, *Geschichte der italienischen Litteratur* (Berlin, 1885-88); better in the translation of Zingarelli, *Storia della letteratura italiana* (Turin, 1889-91); E. C. Stedman, *Victorian Poets* (New York, 1887); F. M. Warren, *History of the Novel Previous to the Seventeenth Century* (ib., 1895); Smith, "Pastoral Influence in the English Drama," in *Modern Language Association, Publications* (Baltimore, 1897);

Gregg, *Pastoral Poetry and Pastoral Drama* (London, 1906); J. C. Dunlop, *History of Prose Fiction* (new ed., with notes, etc., by Henry Wilson, 2 vols., ib., 1906); E. K. Chambers, *English Pastorals* (New York, 1906); Edmund Spenser, *Shepherd's Calendar*, edited by C. H. Herford (new ed., ib., 1907); H. M. Hall, *Idylls of Fishermen* (Columbia University Press, ib., 1912); and the authorities referred to under FRENCH, PROVENÇAL, and SPANISH LITERATURES.

PASTORAL STAFF. See COSTUME, ECCLESIASTICAL; CROSIER.

PASTORELS, or **PASTOUREAUX** (OF. *pastorel*, Fr. *pastoral*, from Lat. *pastoralis*, relating to a shepherd). A name given to two movements which appeared in France—one about 1250, the other in 1320. They were recruited from the lower orders of society, including many shepherds, whence the name. In the year 1251 a certain Jacob, who claimed to be Lord of Hungary and is commonly known as Jacob of Hungary, appeared as their leader in Flanders. The King, Louis IX (St. Louis), was then in the East, engaged in the disastrous Seventh Crusade, and the preceding year had been a prisoner in the hands of the Mohammedans. Jacob preached that God had rejected princes and the mighty and would free the Holy Land by means of the common people. He claimed to have special revelations and assumed ecclesiastical functions.

Encouraged by the Queen mother, he formed his followers in well-organized companies, and, ostensibly on the way to Palestine, they began to overrun the country. The true character of the movement soon became evident. The rulers were attacked, property was destroyed, priests and monks were murdered, and the Jews in particular suffered cruel persecution. The disorders were ultimately put down with a firm hand. Jacob was killed while haranguing a crowd in Paris, or, according to another account, in a conflict at Bourges. In 1320, under Philip V, similar disorders broke out under the same pretext of a crusade to Palestine. These bands of Pastorels ultimately threatened to attack Avignon, when the Pope, John XXII, excommunicated them and the seneschal of Carcassonne dispersed them with an army. Many were slain, but scattered bands long continued to ravage the south of France. Consult Berger, *Histoire de Blanche de Castille* (Paris, 1895), and Le chugeur, *Histoire de Philippe le Long* (ib. 1897).

PAS'TOR FI'DO. See GUARINI.

PASTORIUS, FRANCIS DANIEL (1651-1719). An American colonist, born at Sommerhausen in Franconia, Germany. Having joined the Society of Friends while in England, where he met William Penn, Pastorius in 1683 led a party of German and Dutch Mennonites to the new Colony of Pennsylvania, where they founded Germantown. He was a man of noble character and deep learning and exerted great influence among his countrymen. Five years after his arrival in America he signed a protest addressed to the Friends' yearly meeting in Burlington, N. J. which characterized slavery as unchristian. This protest is said to have been the first formal plea for emancipation made in America and is the subject of Whittier's "Pennsylvania Pilgrim." Whittier also translated the Latin ode to posterity which Pastorius prefixed to the Germantown book of records. Among his other writings is an interesting *Geographical Description of Pennsylvania*, first published under the title

Umständige geographische Beschreibung der allerletzt erfundenen Provinz Pennsylvaniae (1700).

PASTURE, PASTURAGE (OF. *pasturage*, from ML. *pasturare*, to pasture, from Lat. *pastura*, Fr. *pâturage*, from OF. *pasturer*, Fr. *pâture*, feeding, pasture, from *pasci*, to feed; connected with *pastor*, shepherd, *pabulum*, food, OChurch Slav. *pasati*, to feed, Skt. *pā*, to protect). In English and American law, the right of one to turn his cattle or sheep into public or common land or into the land of another for grazing purposes. In the case of private land such a right may arise by agreement, and such is generally the origin of the right in the United States. At common law the owner of pasture land, known as an agister, had no lien on the cattle for the agreed price of pasturing them, but such a lien has in some of our States been conferred on him by statute. The transaction constitutes a bailment for mutual benefit, and accordingly the agister is liable, like any other ordinary bailee, for injuries to the cattle resulting from lack of ordinary care on his part.

In England rights of pasture are frequently found in the nature of permanent rights in another's land known as profits *a prendre*. These, like easements or like other profits (such as the right to take wood or minerals from the land of another), may arise by grant or prescription. Rights of this nature were formerly known as commons or rights of common (Blackstone describes the right under consideration as "common of pasture"), not because they were enjoyed by the community as a common right, but apparently for the reason that the person who had acquired the right, whether by grant or prescription, usually enjoyed it in common with the owner or possessor of the land. Where the right was exclusive even of the owner, it was described as a "sole" or "several" profit. Where the right of pasture was of this character and perpetual, it was deemed to vest possession of the land in the grantee of the right.

A right of pasture may either be appurtenant to land of the person having the right, i.e., the land on which the pasturing cattle belong (on which they are "levant and couchant"), or it may be "in gross," i.e., personal to the owner of cattle to be pastured. In the former case the right passes on the conveyance of the land, as an incident thereof; in the latter case it may be conveyed separately, as a right in gross, but only if it is restricted to a certain number of cattle. In England also a right of pasture may exist as a "common appendant" to arable land, for oxen used to plow the land and for kine and sheep to manure the land. This variety of common exists only by prescription and probably dates back to a time when the lands subject to the right were common in fact, i.e., open to the community for pasturage. Consult Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899), and works cited under EASEMENT and REAL PROPERTY. See COMMON; PROFIT.

PASTURE, PASTURAGE. Pasture is here used in its limited sense, and pasturage as meaning the growing grass and herbage on which stock feeds. The area of the ranges, those great natural pastures of the Rocky Mountain and Great Plains regions, is decreasing as the land is being brought under cultivation by settlers. The pampas of South America and to some extent the steppes of Asia are vast natural feed-

ing grounds corresponding to our ranges. Sometimes the different kinds of farm animals are confined in one enclosure, but most farmers have a separate pasture for swine. Horses and cattle are generally pastured together, although they sometimes annoy and injure each other. Sheep graze much closer than horses and cattle and so place the latter at a disadvantage when pastured with them, while, on the other hand, they are useful in keeping down certain weeds which horses and cattle do not eat. A dairy herd is always most profitably pastured by itself. In the United States, and in all countries where new lands are brought into cultivation, the native prairie is often used for pastures, while in older countries or long-settled regions the cultivated soil is laid down to grass for this purpose. Native grasses are hardy and adapted to the prevailing conditions of soil and climate, so that when they are used the element of uncertainty is entirely eliminated. Pasturing more stock than can be well fed in a pasture of this kind has the effect of killing out the grasses and encouraging the growth of weeds, especially during times of drought. Occasional light applications of well-rotted barnyard manure, followed by a thorough harrowing, are very beneficial when the sod has become unproductive and hard. The care of native pastures further requires that the weeds be always kept down and that hardy tame or wild grasses be sown on places where the sod is becoming bare.

The practice of laying down land to pasture is common in all farming regions and often forms a part of the crop rotation. Pastures on cultivated land intended for only a few years are called temporary pastures and those for a long series of years permanent pastures. In starting pastures on cultivated land the first and most important requisite is a good condition of the soil. The kinds of soil best adapted for pastures are loams and clays, while loose, sandy, and gravelly soils are entirely unsuitable in this connection. Before the land is seeded down the soil is brought to the best possible condition of cultivation and fertility, and if the natural drainage is inadequate artificial drains are laid. A high state of fertility is conducive to a luxuriant growth of grass and a rapid formation of a good sod. A heavy dressing of barnyard manure is well adapted to grass lands, because it not only furnishes all the necessary elements of plant food, but also has a beneficial effect on the mechanical condition of the soil. It is preferable to lay land down to pasture after a hoed crop like corn, which leaves the soil in a good condition of tilth and comparatively free from weeds. The methods of preparing the soil and sowing the grass seed are the same in pasture making as in laying down land to grass for a meadow (q.v.).

The choice of grasses depends largely upon the conditions of climate and soil. On ordinary soils in regions where the rainfall is generally sufficient, Kentucky blue grass (*Poa pratensis*), Canada blue grass (*Poa compressa*), tall fescue (*Festuca elatior*), redtop (*Agrostis vulgaris*), perennial rye grass (*Lolium perenne*), orchard grass (*Dactylis glomerata*), and red and white clover form a good mixture for pastures. Redtop, alsike clover, creeping bent grass (*Agrostis stolonifera*), and perennial rye grass are grown in wet pastures, and red fescue (*Festuca rubra*), redtop, Kentucky blue grass, and white clover in pastures on light sandy soils. In the Southern States Bermuda grass (*Cynodon dactylon*), car-

pet grass (*Paspalum platycaule*), large water grass (*Paspalum dilatatum*), and Texas blue grass (*Poa arachnifera*) are valuable pasture grasses. Timothy (*Phleum pratense*), an excellent hay grass, is often sown for pasture, but it is rather subject to injury by the trampling of stock and close grazing, and it does not form a good turf. Unlike the course pursued for meadows, in selecting pasture grasses those species are sought which furnish a succession of green forage throughout the season. For temporary pastures annual and biennial crops and short-lived grasses are suitable, but for permanent pastures perennial and good turf-making species are required.

Many farmers grow forage crops near their pastures to feed to the stock during times of drought, to prevent injury being done by too close cropping. The droppings of the stock are not sufficient to keep up the fertility of the soil, and hence, as mentioned above, top dressings of barnyard manure and commercial fertilizers are applied to supply the deficiency. The droppings of cattle ought to be broken up and scattered over the ground. Harrowing a pasture in the spring admits heat and light into the soil and favors the growth of grasses and leguminous plants. Weeds should never be allowed to grow in pastures, and the coarsest and rankest grass should be mowed once or twice each year. Re-seeding old pastures is usually not so profitable as breaking and working up the sod and growing a few crops before the land is again seeded down. An abundance of pure water in pastures is a prime necessity. A few trees on the highest points where the stock can find cool shade are of great benefit. A paddock is a small pasture generally located near the barns. Consult W. J. Spillman, *Farm Grasses of the United States* (New York, 1909), and M. J. Sutton, *Permanent and Temporary Pastures* (London, 1911). See MEADOW.

PASTURE, MRS. HENRY DE LA. See DE LA PASTURE, MRS. HENRY (LADY CLIFFORD).

PASZKOWSKI, päsh-köf'ské, WILHELM (1867-). A German educator, born in Gumbinnen. Educated at the University of Berlin, he was employed in the university library from 1892 to 1899, when he became assistant in the Royal Library. In 1902 he became librarian there and was made lector of the German courses for foreign students in the university. Two years later he was put in charge of the university's academic information bureau (Akademische Auskunftsstelle für wissenschaftliche Anfragen). He wrote: *Adam Smith als Moralphilosoph* (1890); *Berlin in Wissenschaft und Kunst* (1910); *Berlin und seine Universität* (1914, and in English); guidebooks for foreign students in Germany; and the report on *German International Progress in 1913* (1914), made to the Carnegie Endowment for International Peace.

PATAGONIA. A name formerly applied to the whole south portion of the South American continent, extending from the Strait of Magellan indefinitely northward to about the thirty-eighth parallel of south latitude. In its present use, though the name has no political significance, it is generally restricted to the region lying east of the Andes and south of the Río Negro (Map: Argentina, F 7). The name is supposed to be derived from the Spanish word *patagón* (a large foot), in allusion to the large footprints found by the first explorers; but it may also come from the Quichua word *patacuna*

(terraces). The region was visited by various Spanish and English explorers after it was first seen by Magellan in 1520. It remained unclaimed by any country until 1881, when it was incorporated into Argentina, while the strip west of the Andes was given up to Chile. The latter portion now constitutes the Chilean Territory of Magallanes (q.v.), and Patagonia proper consists of the Argentine territories of Río Negro, Chubut, and Santa Cruz (qq.v.).

Bibliography. H. H. Prichard, *Through the Heart of Patagonia* (London, 1902); Princeton University expeditions to Patagonia, 1896-99, *Reports* (8 vols., Princeton, 1901-11); T. Falkner, *Descripción de la Patagonia* (Buenos Aires, 1911); F. B. Loomis, *Hunting Extinct Animals in the Patagonian Pampas* (New York, 1913); B. Willis, *Northern Patagonia* (ib., 1914). See ARGENTINA; CHILE; POLAR RESEARCH; and, for the inhabitants, TEHUELCHES.

PATAGONIAN CAVY. See CAVY.

PATALA, pä-tä'lä. In Hindu mythology, the name of a series of lower worlds, each 10,000 *yōjanas*, or miles, in depth. According to the Puranas (q.v.), they are usually seven in number: Atala, Vitala, Sutala, Rasatala, Talatala, Mahatala, and Patala. Other authorities make eight: Patala, Tala, Atala, Vitala, Tala, Vidhi-Patala, Sarkara-Buhmi, and Vijaja. These regions are entirely distinct from the Narakas (see NARAKA), or hells, and are inhabited by various classes of semidivine beings such as the Nagas, or serpents. The soil is white, black, purple, yellow, sandy, stony, and golden, respectively, and they are embellished with magnificent palaces, decorated with brilliant jewels, and filled with delicious viands and wines. There are in these regions beautiful groves and streams and lakes, where the lotus blows and the skies are resonant with the songs of birds. Consult Wilkins, *Hindu Mythology* (2d ed., London, 1900).

PATALIPUTRA, pä'tä-lé-pōō'trä. A famous city of ancient India and the capital of the Kingdom of Magadha (q.v.). It was situated at the junction of the Son (Skt. *Sōna*, classical *Erannobos*) River with the Ganges. It seems, therefore, to have stood near the site of the modern city of Patna. It was the chief city of the Nanda and Maurya dynasties and is famous as the residence of Megasthenes (q.v.) during his stay in India about 305 B.C. It was also called Palibothra, Pushpapura, and Kusumapura, both of the latter terms meaning "Flower City."

PAT'AMAR (East Indian name). A species of sailing vessel or boat used along the coast of India, especially in the vicinity of Bombay. It is of the grab (q.v.) type, is fast, and has a large carrying capacity. It was formerly much used for carrying dispatches, but steam vessels have now superseded it in this work.

PATAN, pä-tän', or PATTAN. A town in the State of Baroda, India, 55 miles northwest of Ahmadabad (Map: India, B 4). It contains over 100 Jain temples and is celebrated for its collections of Jain manuscripts of palm leaf. It occupies the site of Anhilvada, the ancient capital of the Gujarati Kingdom, which was captured by Mahmud of Ghazni in 1024. The principal products are swords, embroidery, silk, and pottery. Pop., 1901, 31,402; 1911, 28,339.

PATAN. A town in Gujarat, India. See SOMNATH.

PATANJALI, pä-tün'jä-lé (probably second century B.C.). The founder of the Yoga

(q.v.) system of Hindu philosophy. There seems to be little reason to doubt that he actually composed the *Yōga sūtras*, edited and translated by Rajendralala Mitra (Calcutta, 1883), which formulate the principles of the Yoga philosophy. He is generally regarded, probably correctly, as the author of the *Mahā-bhāṣya*, edited by Kielhorn (3 vols., Bombay, 1878-85), a commentary on the *Vārttikas*, or Explanations, of Katayana (q.v.), which form in their turn a commentary on the grammar of Panini (q.v.). Consult: R. Garbe, *Sāṃkhya und Yoga* (Strassburg, 1896); Max Müller, *Six Systems of Indian Philosophy* (New York, 1903); Paul Deussen, *Outlines of Indian Philosophy* (Berlin, 1907); Desai, *Study of Indian Philosophy* (Bombay, 1906); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

PATAPSCO RIVER. A river of Maryland, which flows in a southeasterly direction into Chesapeake Bay, 13 miles south of Baltimore (Map: Maryland, F 2). The volume of the stream is comparatively small, but as it has a considerable current there have been established along its course numerous water-power stations which are valuable to Baltimore.

PATARINES, or PATARENES, pāt'ā-rēnz. A name applied in Milan in the eleventh century to the reforming party, who held their meetings in the Pataria, or ragmen's quarter. Under the leadership of Anselm of Lucca and the deacon Arialdo they took energetic steps to suppress clerical concubinage and simony. They were supported by Pope Nicholas II, but the emperors and many of the nobility opposed them forcibly, and as a popular movement the Pataria died out early in the twelfth century. The name of Patarini was, however, appropriated by the Cathari (q.v.) or Manichean heretics of northern Italy and southern France and was also used for the Bogomiles (q.v.) of Bosnia and Herzegovina. Consult A. Krüger, *Die Pataria in Mailand* (Breslau, 1873-74).

PATAS (pā-tās'; African name) **MONKEY.** One of the guenons (*Cercopithecus*, or *Erythrocebus*, *patas*), a native of Senegal, west Africa, distinguished from all others by its reddish color and grayish cheeks and underparts. It is usually to be seen in menageries. See **GUENON**.

PATA'VIAN. The Roman name of the modern Padua.

PATCH, SAM (UEL) (1807-29). An American noted for various feats of leaping. He was born in Rhode Island, went to sea in early life, and afterward settled at Paterson, N. J., where he was a cotton spinner. Because of his threats to jump from a bridge over the Passaic River he was finally placed under arrest. A few months later the successful performance of the feat gave him such widespread notoriety that he traveled about, leaping from the yardarms or diving from the topmasts of ships. He lost his life in making a jump of 125 feet into the Genesee River below the falls at Rochester, N. Y.

PATCHOGUE, pā-chōg'. A village in Suffolk Co., N. Y., 55 miles east of New York City, on the shore of Great South Bay and on the Long Island Railroad (Map: New York, B 2). It is popular as a place of residence and as a summer resort and has several hotels, fine church edifices, a high school, and a public library. The village has extensive oyster and fish interests, an ice and cold-storage plant, lumber yards, and manufactories of lace curtains and surveyor's steel tapes and supplies. It was incorporated

in 1893. The government is administered by a village president, who holds office for a year, and a board of trustees, elected on a general ticket. Pop., 1910, 3824; 1915 (State census), 4500.

PATCHOULI, pā-chō'li (Fr., from the East Indian name). The powerfully odoriferous dried branches of *Pogostemon patchouli* or *Pogostemon heyneanus* of the family Labiatae, which first appeared in commerce in 1844. The plant is a native of the Malay coast, Ceylon, Java, the neighborhood of Bombay, and probably also of China and Japan. The odor of patchouli was known in Europe before the material itself was introduced, because of its use in keeping moths out of Cashmere shawls; hence genuine Cashmere shawls were known by their scent until the French found the secret and imported the herb. In India, where it is known as puchapat, it is used as an ingredient in fancy tobaccos, as a perfume for the hair, and for keeping insects from linen and woolen articles. Patchouli yields by distillation a peculiar heavy brown oil, disagreeably odoriferous, which requires extreme dilution for perfumery purposes.

PÂTÉ DE FOIE GRAS, pāt'ā de fwā grā (Fr., paste of fat liver). A dish, sometimes called Strassburg pie, resembling a very delicately seasoned potted meat, greatly esteemed by epicures, and, as the name indicates, made of the abnormally large and fat livers of artificially fattened geese or ducks. The pâtés, ordinarily covered with rendered goose fat as a protection from the air, are usually marketed in earthenware pots. Strassburg and Toulouse are the chief places of manufacture. The pâtés are exported to every part of the world, and the trade amounts to several hundred thousand dollars annually. The fowls are fed and "stuffed" to repletion with salted maize, and by this means the liver is increased to the unnatural weight of two, three, or more pounds.

PATELLA (Lat., small pan or dish, kneepan, patella), or **KNEECAP.** A sesamoid bone, developed in the common tendon of the rectus, vastus externus, and vastus internus muscles—the great extensor muscles of the leg. It is of rounded, somewhat heart-shaped form, the broad end being directed upward and the apex downward. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striæ, while the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh bone, while the two facets (of which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture. Dislocation is rare. It may occur either inward or outward, most frequently the latter. The displacement may be caused either by external violence or by too sudden contraction of the extensor muscles in knock-kneed, flabby persons. It may be readily detected by the limitation of active motion and by the bone being felt in its new position; the dislocation is easily reduced.

Fracture of the patella may (like dislocation) be caused either by muscular action or by external violence. The conservative treatment consists in relaxing the opposing muscles by raising the trunk and slightly elevating the limb, which should be kept in a straight posi-

tion, while straps and other devices are applied directly to the fragments to secure their close approximation. In consequence of the great difficulty of bringing and retaining the broken surfaces in exact apposition, it is difficult to obtain bony reunion of the parts, and the treatment often results either in mere ligamentous union or in no true union at all. The end in these cases is a loss of power to completely extend the leg.

The operative treatment consists in cutting down on the fragments and fastening them together with catgut, wire, or some other form of suture. It is attended with remarkably perfect results, but is not devoid of danger to the joint. A measure intermediate between operative and nonoperative treatment consists in the application of hooks, pegs, nails, or other devices which seize the fragments through the skin and hold them in apposition until union has taken place. See illustration in KNEE JOINT.

PATELLA. See LIMPET.

PATEL/LAR REFLEX. See KNEE JERK.

PAT'EN (Lat. *patena*, *patina*, flat shallow dish, from *patere*, to lie open; connected with Gk. *περαννίνα*, *petannynai*, to spread out). The plate on which the bread in the eucharistic service is consecrated, sometimes used also for the distribution to the faithful. In the earliest centuries it was of wood, glass, or the more ordinary metals and underwent the same changes as the chalice (q.v.), which it accompanied. As early as the fourth century, however, patens were often made of silver or gold, weighing 30 pounds and more. These early examples were of large size and called *patenæ ministeriales* or *communicales*. The smaller patens (*patenæ parvæ*) for the use of the celebrant at the altar were of far later origin. Special patens were used for the chrism in baptism and confirmation (*patenæ chrismalis*). Patens were usually circular, though later examples are sometimes polygonal or square. A very few examples remain of the Byzantine and Romanesque periods, of silver with decoration in low relief, niello, or enamel.

PATENIER, JOACHIM. See PATINIR, JOACHIM.

PÂTENÔTRE (DES NOYERS), păt'nôtr' (dă nwă'yă'), JULES (1845-). A French diplomat, born at Baye, Marne. He was educated at the Ecole Normale Supérieure, entered the diplomatic service in 1871, held posts in Greece, Persia, Argentina, China, and Sweden, and in 1884-85 had charge of the negotiations to regularize the French protectorate in Annam and signed a treaty of peace at Tientsin with Li Hung Chang. Pâtenôtre then served as Minister in Morocco in 1888-91; in the latter year was transferred to Washington, where he was Ambassador in 1893-97; and was Ambassador to Spain from 1897 to 1902. He published *Souvenirs d'un diplomate* (1913 et seq.).

PAT'ENT (from Lat. *patens*, lying open, patent, pres. p. of *patere*, to lie open; originally in the phrase *litteræ patentes*, letters patent, open letters). In the most general sense a grant by the sovereign or the state to an individual of any property, franchise, privilege, or title; specifically such a grant to an inventor or discoverer of a useful art or device of the exclusive right to make, manufacture, and sell for a certain period the thing invented or discovered by him. By the common law an inventor has

no protection in the exclusive use of his invention in the absence of a patent conferring such a right upon him. The policy of encouraging useful discoveries and inventions in the arts and industries by securing to discoverer and inventors the exclusive benefits of their discoveries is an old one among governments. It was a common practice among the Tudor sovereigns of England to grant to inventors such exclusive privileges, a power which was much abused until it was controlled and regulated by the famous Statute of Monopolies, passed in the twenty-first year of James I (1624). This statute restricted the grant of such rights to "the true and first inventor" and limited it to a fixed term of 14 years. It is still in force though it has been amended by successive enactments, now embodied in a comprehensive Patent Act, 1907. The British policy of encouraging by exclusive privilege the invention of new and useful articles was extended to the English Colonies in America, and we find occasional Colonial statutes empowering certain persons to exercise the exclusive right to manufacture articles of use which they have invented.

The Constitution (Art. I, Sec. 8) of the United States recognized and sanctioned the policy by conferring authority upon Congress to secure to inventors the exclusive use of their invention for limited periods of time. In pursuance of this authority Congress in 1790 passed the first national Act providing for the granting of patents to the inventors of "any useful art, manufacture, engine, machine, or device, or any improvement therein not before known or used." Applications for patents under this law were required to be made to a board consisting of the Secretary of State, the Secretary of War, and the Attorney-General. The patent was issued by this board upon the concurrent action of two members, was authenticated by affixing the great seal of the United States, and was valid for such term not exceeding 14 years as the board might in its discretion agree upon. The Law of 1790 contained provisions for the punishment of infringements and provided that no distinction should be observed between foreigners and American citizens in the granting of letters patent. In 1793 a new statute was passed, repealing the Act of 1790 and making several changes in the system. The new Act restricted the grant of patents to citizens of the United States; required applicants to surrender to the United States any patents which they might have received from any State prior to the adoption of the Constitution; provided that application should be made to the Secretary of State, the conflicts between applications should be decided by a board of three arbitrators, and that patent obtained by fraud or misrepresentation could be declared void by a United States district court upon due proof. Supplemental Acts were passed in 1794 and 1800. About this time the judicial question arose as to whether the power of Congress was exclusive in the matter of patent (*Gibson v. Ogden*, 9 Wheat. i.), but the precise point as to the right of a State to grant patent was not decided. Since then, however, the opinion has become settled that the power of Congress in the premises is exclusive.

The year 1836 marks the beginning of a new era in the patent system of the United States. In that year all previous statutes were repealed and a comprehensive Act was passed which brought the system substantially into its present

condition. It created a patent office to be attached to the Department of State, at the head of which was to be a commissioner of patents; it introduced the policy of preliminary examinations for the purpose of determining the patentability of an invention and provided for a board of appeal to hear appeals from the decisions of the examiner and Commissioner against the patentability of an invention. The patent privilege was now extended to any alien who had resided one year in the United States and who had made a declaration of intention to become a citizen. Provision was also made for filing caveats on uncompleted inventions, and the policy of reissuing patents was confirmed and extended. Exclusive jurisdiction of cases involving patent rights was conferred upon the United States Circuit Courts. Provision was also made for extending the duration of patents for a period of 7 years after the expiration of the original 14. Various amendments of the patent laws were made during the succeeding years. In 1842 provision was made for patenting designs for a period of 7 years. By an Act of 1861 the term of patents for inventions was extended from 14 to 17 years, all former acts discriminating between aliens and citizens were repealed, a uniform scale of fees was adopted, and a board of examiners intermediate between the regular examiners and the Commissioner was established to hear appeals from the former. Finally, in 1870, the whole system of patent legislation was revised and codified and brought into its present condition.

As the laws now stand (Rev. Stat., § 4886) any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof, and not in public use or on sale for more than two years prior to his application, unless the same is proved to have been abandoned, may upon payment of the fee required by law obtain a patent therefor.

Patents are obtained by making application to the Commissioner of Patents in accordance with forms prescribed by law. The form prescribed is that of a petition together with an oath that the applicant believes himself to be the first inventor. The application is accompanied by a specification describing the invention in a full, clear, and concise manner. Drawings accompany the specification in cases which admit of it, and the Commissioner may require the applicant to furnish the office with a model of the article, but this of late years has not usually been required except when necessary to a correct understanding of the article. The application upon being received is referred to the proper examiner for inquiry as to whether the article possesses novelty and utility and whether it has already been anticipated in the United States or abroad. If no objection is found by the examiner the patent is issued. If objection is raised by the examiner the applicant may amend his application so as to eliminate from the claims the features to which exception has been taken. If still refused he may appeal to the board of examiners, and from their decision he may appeal to the Commissioner of Patents. Finally, an appeal lies to the Court of Appeals of the District of Columbia. The fee upon filing an application is \$15; on issuing

Vol. XVIII.—11

the patent, \$20; on application for reissue of a patent, \$30. A prior patent by the inventor in a foreign country does not debar him from receiving a patent in the United States, provided the application be made within seven months of the application for the foreign patent.

The Statute of 1870 permitted the inventor of an incomplete invention to protect himself against the anticipation of his patent by filing in the Patent Office a caveat describing the invention and asking that his rights be protected, but this provision was repealed by Act of Congress in 1910.

The judicial interpretations of the provisions of the statute above outlined form the great body of the substantive law of patents in the United States. The alternative use of the words "invention" and "discovery" early attracted attention, and the question arose as to whether different meanings were to be ascribed to them. It was undisputed that the mere discovery of a force of nature could not be patentable, as natural forces and elements belong to all mankind, and it was finally determined that the word "discovery" as used in the statute was synonymous with "invention" and involved the exercise of inventive or creative genius. For example, the person who discovered electricity as a force could not have obtained a patent allowing him the exclusive use of that force of nature, but Morse, who applied electricity to the communication of messages, was allowed a patent on his system of telegraphy, as that was a device calling for inventive genius in its creation and was not merely the finding of an already existing thing.

Under the word "art" many of the processes now held patentable are classified. A process is a combination of the elements or laws of nature designed to accomplish a useful result. The word "machine" includes all contrivances whereby mechanical parts or pieces are arranged to move together for the production of some useful result, and it is under this head that most patents are granted in the United States. The word "manufacture" is construed to mean anything new, made by the hand of man, which is not included in the other terms employed in the above sections, and covers fabrics, furniture, clothing, etc. The term "composition of matter" is defined as the uniting of two or more elements or substances by chemical union or by mechanical mixing, and includes such products as paints, medicines, etc. Frequently it is very difficult to determine under which of the above heads an invention should properly be classified, but it is held not to be absolutely essential for an inventor to do so, provided it is certain that his invention comes under one or more of them. The section allowing patents for designs is liberally construed to include ornamental as well as useful designs.

A thing for which a patent is asked must have the three general characteristics prescribed by the statute, viz.: it must be an invention; it must have novelty, i.e., be new; and it must be useful. The determination of whether a thing presented really constitutes an invention is sometimes a very difficult matter. In general it may be said that it is not invention to devise something that is not a practical working device but needs more thought or experiment to enable it to produce the result; or to construct or produce something which any mechanic or reasonably skilled person in the particular line would produce, upon request, in the exercise of his ordi-

nary skill; or to put better materials or workmanship into a known article; or to change the size of a thing; or to omit a useless or dead part of a machine or device; or to substitute an equivalent which merely performs the same office as the part taken away without improving the operation of the whole; or to make a new or double use of a known article without improving on it, as by utilizing the principle of an ice-cream freezer for the purpose of preserving fish. A person who produces a combination of elements or of mechanical devices need not be able to explain the scientific reasons for their combination or adjustment in the particular manner or form in which he presents them in order to be considered the inventor, provided he can describe the materials and the combination or construction in such a way that the same result can be accomplished again. See INVENTION.

A distinct and original improvement on an old invention is patentable, but a patent on the improvement does not disturb the rights of the inventor of the first device to its exclusive use as it was. It is not necessary that an inventor be personally able to construct the device which he has conceived, if he can dictate his ideas to a skilled mechanic so that the latter can readily construct the device without the exercise of his own inventive genius. However, the mere conception of a result without a practical means of attaining it is not invention.

The word "new" in the statute is not confined to its ordinary meaning, but includes anything which has not before been made public or been given to the world. For example, if A presents a model of a machine together with an application for a patent on it, at the Patent Office, he is first entitled to a patent, although another inventor may later bring there a machine identically the same as the first and be able to prove that he had conceived and constructed it long before A, provided the inventor who first conceived the machine had not used it or made it public in any way. However, if the thing which is sought to be patented has been previously used in a single instance by other parties, even though that use was not known to the public at large nor to the person seeking to have it patented, it is sufficient to defeat a claim for a patent on the device presented, through want of novelty.

The statute also requires that an invention to be patentable must be useful. This requirement is liberally construed, and almost anything which is not injurious to public health or morals can be patented if it contains the other essential characteristics and contributes to the comfort, convenience, or pleasure of mankind. Thus, a toy intended for the amusement of children may be patented as a useful article.

A patent will be issued only to the inventor, except that, if he dies before making application, his personal representatives are permitted to do so, and that he may sell his rights in his invention before obtaining a patent and have the patent issued to his assignee. Joint inventors must have their inventions patented to both jointly.

Foreign inventors may obtain patents in the United States subject to the condition that if their inventions are not known in the United States before they make application, and a citizen of the United States has made the same invention without knowledge that it had previously been produced abroad, the latter can obtain a

patent in preference to the former, even though his application be filed subsequently. Where an employee makes a new thing under the guidance and direction of his employer, the latter is entitled to the patent, as he is the actual inventor; but if an employee, independently of the suggestions of his employer, conceives and produces something which is patentable, he is entitled to the patent, as his inventive faculties alone were employed; but the employer may by the terms of his contract with the employee be entitled to an assignment of the patent.

Before or after filing an application an inventor may abandon his invention to the public by express acts or words or by such conduct that an intention to do so may be presumed. Delay in making or completing an application and lack of public exhibition or use of the invention are considered evidence of abandonment. However, if the inventor was too poor to defray the expenses of an application, or was unable, through temporary insanity, illness, or any other reasonable cause, to make application, the above presumption will be rebutted.

Where a patentee has reason to believe that his patent is defective by reason of an insufficient description in the specifications, or that his claims were not broad enough to include all the principles of his invention, or if there was an error affecting it in the Patent Office, he may surrender the old patent and at the same time file an application to have a new one issued to him upon proper specifications. This is known as surrender and reissue. A good patent cannot be thus surrendered for the purpose of having a new one containing the features of a subsequent improvement issued to the inventor. The reissue must be for the same invention.

Where a claim in a patent covers more than the patentee is lawfully entitled to, the patent is void. However, where this has occurred through inadvertence or mistake, the patentee may file an instrument known as a disclaimer, which should contain a clear statement of what he justly claims as his own invention and what he disclaims. Unless this is done such a patentee cannot maintain an action to protect whatever rights he is actually entitled to in the invention.

Where two or more patents contain claims which are identical they are known as interfering patents. In such a case any one of the patentees may bring an action in equity to have the respective rights of the interfering patentees determined, and only one of the patents can be sustained as valid.

Patents are considered as property, and may be sold and transferred by assignments in writing. Provision is made for recording such assignments in the Patent Office, and unless this is done within three months after its date an assignment will be void as against innocent purchasers or mortgagees for value. Patents may be held by joint owners, partners, or corporations. An owner of a patent may convey a part interest in it, or grant a license to another to use it upon payment of royalties or a fixed rent, or may grant the right to make and sell it for an agreed period.

All patented articles should be marked with the word "patented" and with the exact date on which the patent was granted. Unless this is done no damages can be recovered in an action for an infringement, if the infringer had no previous notice of the existence of the patent.

Where an unpatented article is marked "patented" the person so marking it is liable to a penalty of not less than \$100 and costs, to be recovered in a *qui tam* (q.v.) action, one-half of which goes to the informer and the other half to the government.

An infringement of a patent consists in wrongfully making, using, or otherwise dealing with a patented invention. A person to whom the patentee sells a patented machine may make necessary repairs from time to time, but they must not amount to a reconstruction of the machine, and he cannot build a new machine without being guilty of an infringement. Many cases of infringement arise in regard to patented compositions of matter by an infringer substituting an equivalent for one element. A patentee has two remedies for an infringement. He may sue at law for damages or may apply to a court of equity for an injunction restraining the infringer from continuing his acts and incidentally be awarded damages for the injury suffered. If the patented article is properly stamped it is no defense that the infringer had not seen or heard of it.

From the earliest period through 1913, 1,093,223 patents had been issued by the United States government and (estimated) 2,455,810 by foreign governments. In 1913, 35,788 patents were issued in the United States out of 70,376 applied for, 31,382 to citizens of this country and 4212 to citizens of foreign countries; 164 were reissued and 30 withdrawn. It is estimated that during the same year, 1913, 104,907 patents were issued in foreign countries. Of the patents taken out by foreigners Germany claimed 1433, England 908, Canada 557, and France 340.

PATENT LEATHER. See **LEATHER**.

PATENT OFFICE. A government department or bureau established by Act of Congress in 1836, with a commissioner at its head charged with performing all duties relative to the granting of patents. In 1849 the Patent Office was transferred to the newly created Interior Department, where it has since remained. From the beginning provision was made for the collection and preservation of models, as a result of which an immense collection of specimens and designs has been gathered. In 1836 the building in which the models had been kept was burned and many of them were destroyed, but Congress made an appropriation of \$100,000 to procure duplicates of the most valuable ones. Again in

1877 a part of the building was burned together with many models, but the most of these were replaced by the manufacture of new ones.

The business of the Patent Office during the early years of its existence was small, the number of patents granted varying from 400 to 600 annually during the period from 1837 to 1847. In 1840 the applications for patents amounted to 765, while the number of patents actually issued was 473. In 1914 the number of applications was 67,774, while the number of patents granted was 39,945. The receipts of the Patent Office usually exceed the expenditures, although there have been exceptional years. In 1840 the receipts and expenditures were respectively \$38,056 and \$39,020; in 1914 they were \$2,251,893 and \$2,000,770. The Commissioner of Patents is required to make an annual report of the business of the office, giving with other information a list of patents issued during the year, with the names of the patentees. Specifications and drawings of all inventions are likewise published in a monthly volume. Until 1862 the Patent Office also published an annual volume on agriculture. An official gazette containing lists of patents, issued together with brief descriptions and drawings, decisions of the office on important questions arising in the course of the administration, and important judicial decisions affecting patents, is now one of the regular weekly publications of the office. The Commissioner of Patents is aided by an assistant commissioner, three examiners in chief, and a large number of examiners, each of whom has charge of a distinct class of inventions. Besides these there are several hundred assistant examiners, clerks, messengers, etc.

PATER, pâ'tâ', JEAN BAPTISTE JOSEPH (1696-1736). A French genre painter, born in Valenciennes. He studied under his father, Antoine Pater, a sculptor, and for a short time under Watteau. About 1717 he established himself in Paris, and by dint of hard work and miserliness amassed a considerable fortune, but died worn out at the age of 40. He was made an Academician in 1728. His art is copied after Watteau, but lacks his master's vivacity, invention, and poetic refinement. His methods are mechanical and his execution, which was forceful and lively in his earlier paintings, became more and more superficial. His figures are elegant, his heads graceful, and his color delicate and pleasing, but his landscapes are tiresomely conventional. The "Fête Champêtre" and "The Bath" are examples of the subjects he most frequently treats. Good examples are in the Louvre; in London in the South Kensington Museum, Buckingham Palace, and the Wallace collection; in the galleries at Edinburgh and Stockholm; and in the royal palaces at Potsdam, which latter contain the finest existing collection of his works. "The Comical March" is in the Metropolitan Museum, New York.

PATER, pâ'tēr, WALTER HORATIO (1839-94). An English essayist, born at Shadwell in the east of London, Aug. 4, 1839. He was educated at King's School, Canterbury, and at Queen's College, Oxford, graduating B.A. in 1862. In 1864 he was elected fellow of Brasenose College. Except for his visits to the Continent and a short residence in London, he passed his life at Oxford. He had come to the university with the intention of entering the Church of England, but by 1865, the date of his first visit to Italy, he had lost all belief in Christian doctrines. He

found his mission in interpreting to his age the spirit of the Renaissance in art and literature. For this end he employed the historical novel, the story, and, mainly, the essay. In all his work, much of which originally appeared in the reviews, he wrought with the greatest care, aiming at absolute precision in the expression of his thoughts and emotions. The result was an extremely delicate and refined style, delightful in its rhythm, but lacking in vigor and simplicity. After a quiet career as tutor and author Pater died at Oxford, July 30, 1894. His publications in book form comprise: *Studies in the History of the Renaissance* (1873), containing the brilliant essay on Winckelmann; *Marius the Epicurean* (1885), a masterly exposition of the best phases of Epicureanism, put into the form of an historical novel; *Imaginary Portraits* (1887), essays in philosophic fiction; *Appreciations* (1889); *Plato and Platonism* (1893); *The Child in the House* (1894), an imaginary portrait. After his death appeared *Greek Studies and Miscellaneous Studies* (1895); *Gaston de Latour* (1896); and a volume of essays collected from the *Guardian*, privately printed (1897). His *Works* in 10 volumes appeared in 1910 (New York).

PATERAITE. See MOLYBDENUM.

PATERCULUS, GAIUS VELLEIUS (c.19 B.C.-c.31 A.D.). A Roman historian, descended from an ancient and wealthy Campanian family. He entered the army at an early age and from 4 to 12 A.D. served under Tiberius as *Præfectus equitum* or *legatus* in Germany, Pannonia, and Dalmatia. He was a great favorite with Tiberius, and, when the latter became Emperor 14 A.D., Paterculus was appointed prætor. He was alive in 30 A.D., as his history comes down to that year; but it is conjectured that in the following year he was perhaps put to death as one of the friends of Sejanus, of whom he speaks highly in his work. Paterculus' claim to remembrance lies in his *Historiæ Romanæ*, a compendium of universal, but more particularly of Roman, history, in two books. The work as we have it is not complete, the beginning and a portion following the eighth chapter being wanting. It seems to have commenced with the fall of Troy and describes only the most prominent historical incidents, but these, fortunately, with considerable fullness of detail. The editio princeps of the *Historiæ Romanæ* appeared at Basel in 1520. Later editions are by Kritz (Leipzig, 1840); Haase (ib., 1863); Halm (ib., 1876); and Rockwood (Boston, 1893). There is a partial English translation by Baker (London, 1814) and a complete one in the Bohn Library (ib., 1859). Consult W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910).

PATERERO, păt'ê-râ'rô (corrupted from *pederero*, from Sp. *pedrero*, swivel gun, from ML. *petraria*, stone-throwing engine, from Lat. *petra*, from Gk. *πέτρα*, rock). A small gun, firing a

shot weighing 12 pounds or less, formerly much used as a swivel. It was mounted on the ship's rail or in the bow of a boat. (See GUNS, NAVAL.) The name is also applied to a small mortar for firing salutes on holidays and at festivals, especially in Roman Catholic countries.

PATERINA. A genus of brachiopods found fossil in the lowest Cambrian rocks of North America and including the most primitive forms. It is semicircular in outline, with straight hinge line and no cardinal area. Its characters are repeated in the ontogenetic development of later brachiopods. See PALEONTOLOGY.

PATER JOCHEM, păt'êr yô'kêm. See HAS-PINGER, JOACHIM.

PATERNO, păt-êr'nô. A town in the Province of Catania, Sicily, situated on the south side of Mount Etna, 11 miles west-northwest of Catania (Map: Italy, E 6). On a height overlooking the city stands an ancient Norman castle, including a Norman tower and chapel with frescoes. There are mineral springs and a trade in wine, oil, and hemp. Paterno is built on the site of the old Greek city of Hybla Major. Pop. (commune), 1901, 23,453; 1911, 28,923.

PATERNO' DI SESSA, dê sês'sâ, EMANUELE (1847-). An Italian chemist. He was born at Palermo, where he graduated from the university in 1872 and where he was later, for a time, rector of the university. After 1889 he was a member of the national Senate, and afterwards resided at Rome, where he was also professor of chemistry in the university there. Paterno' wrote extensively on chemical subjects.

PATERNOSTER, păt'êr-nô's'têr or păt'êr- (Lat., Our Father). A name for the Lord's Prayer (q.v.) commonly used among Roman Catholics, from the opening words of the Latin version employed in all their services. In the rosary (q.v.) it is combined with the Hail Mary, the beads used for the Lord's Prayer, which are also called paternosters, being larger and sometimes made of different material.

PATERNOSTER ROW. A noted London street, long the focus of the publishing and book trade of the city. Its name is derived from the makers of rosaries and prayer books, who formerly made it their headquarters.

PATERSON. An important manufacturing city, the county seat of Passaic Co., N. J., 16 miles northwest of New York City, on the Passaic River, the Morris Canal, and the Erie, the Delaware, Lackawanna, and Western, and the New York, Susquehanna, and Western railroads (Map: New Jersey, D 2). Its area of 8½ square miles makes it one of the smallest of the densely populated cities of the United States. The city was founded primarily as an industrial centre through the activities of Alexander Hamilton. Hamilton was convinced that the United States would never be independent of Europe until it could manufacture within its own borders all the textiles needed for its own use. He therefore was instrumental in organizing the first great industrial corporation in America, the Society for the Establishing of Useful Manufactures, which received a charter from the State of New Jersey in 1791 and established the town site of Paterson in the vicinity of Passaic Falls for the purpose of using the water power. The Company was authorized to issue \$1,000,000 in capital stock. They established cotton mills, paper mills, and other manufactories and still maintain a large number of mills in Paterson and vicinity. Paterson became a township in

1831 and was made a city in 1851. Its government is of the commission form. The mayor is elected by the people and he appoints bipartisan commissions of four members each, consisting of board of finance, board of public works, board of fire and police commissioners, and larger boards of education, health, playground and recreation, parks, library, and the like. The board of finance is so organized that it has no power to spend money, that being delegated to the other boards, which in turn have no power to pay bills, that being the province of the board of finance. Paterson spends annually for municipal purposes \$1,575,120. The main items of expense are \$615,822 for schools, \$210,554 for the fire department, and \$207,000 for the police department. The assessed valuation in 1914 was \$106,000,000, the bonded indebtedness \$5,087,000, and the sinking fund \$1,149,936.

Paterson has 350 silk-manufacturing plants of all kinds, the silk mills being the most extensive in the United States. Other prominent industries are the manufacture of locomotives, shirts, machinery, paper boxes, twine, and thread, and the dyeing of silk and cotton. In 1909 there were 702 manufacturing establishments, representing an invested capital of \$66,402,000. The number of wage earners was 32,004 and the value of products \$69,584,000. The production of the silk industry was valued at \$40,358,000. The city is a large trading centre.

On account of the necessity of keeping the silk fabric clean while in process of making, none of the factories in the city use soft coal, and consequently Paterson has the aspect rather of a residential than of a manufacturing city. Its death rate of 11.43 is one of the lowest of the large cities in the United States. Paterson has two large and many small parks. The hills about the city make natural play and recreation grounds. The city is midway between the lake and seashore resorts of New Jersey. The fine roads from Paterson leading to Lake Hopatcong, Greenwood Lake, and other famous inland New Jersey watering places make driving and motoring one of the principal pleasures of the people. There are a number of fine clubhouses and institutional buildings, and the City Hall, County Court House, and Public Library are imposing buildings. The city's nine banks show resources of \$43,000,000 and the largest of the savings banks has deposits of \$14,500,000. Besides the many social and civic clubs Paterson has 250 fraternal, benevolent, and similar organizations. The steady growth of the city is indicated in the following statistics: Pop., 1850, 11,334; 1860, 19,586; 1870, 33,579; 1880, 51,031; 1890, 78,347; 1900, 105,171; 1910, 125,600; 1914 (U. S. est.), 134,305. In 1910 the population included 50,179 persons of foreign birth. Of these 9317 came from Italy, 6861 from Russia, and 5741 from Germany.

PATERSON, JAMES ALEXANDER (1851-). A Scottish Biblical scholar, born in Dalry, Galloway, where his father was a United Presbyterian minister. He was educated at Aberdeen University and at Pembroke College, Oxford. In 1876 he was made professor of Hebrew and Old Testament exegesis in the United Presbyterian College at Edinburgh and in 1900, upon the union of the Free church and United Presbyterian church, he became colleague (and then successor) of A. B. Davidson in New College. He edited Davidson's *Old Testament*

Prophecy (1904) and his other posthumous works and translated Hermann Schultz's *Old Testament Theology* (2d ed., 1898). Paterson wrote *The Period of the Judges* (1887) and commentaries on Leviticus (Temple Bible) and Numbers (Polychrome Bible).

PATERSON, JOHN (1744-1808). An American soldier, born at New Britain, Conn. He graduated at Yale in 1762, practiced law for a time in New Britain, removed to Lenox, Mass., in 1774, and was elected a member of the Massachusetts Provincial Congress. Immediately after the battle of Lexington he led a regiment of minutemen to Cambridge and helped to erect the first redoubt near Boston. He afterward served with great gallantry in the Canada and New Jersey campaigns in the operations against Burgoyne and became a brigadier general (1777) and a major general (1783). He held a command in the Massachusetts militia during Shays's Rebellion in 1786, and afterward (1794) removed to Lisle (now Whitney's Point), N. Y., and became county judge of Broome County. He served four terms in the State Legislature, was a member of the State Constitutional Convention in 1801, and was a member of Congress in 1803-05. From 1805 until his death (at Lisle) he devoted himself to farming. Consult Eggleston, *Life of Major-General John Paterson* (2d ed., New York, 1898).

PATERSON, ROBERT (1715-1801). A Scottish stonemason, born near Hawick, who is immortalized by Sir Walter Scott as Old Mortality. After his marriage he leased a quarry of his own, but, being a Cameronian (see CAMERONIANS) with the courage of his convictions, his house was burned and himself made prisoner by the Jacobites on their retreat from England with Prince Charles in 1745. Paterson began his wanderings by taking monuments into the Galloway district for the graves of the Covenanters, and from 1758 he forsook his wife and family in his enthusiasm for his self-appointed task. For more than 40 years he and his old white pony were well-known figures in the vicinity of every churchyard of southern Scotland where there were Cameronian monuments. Old Mortality restored their lettering and otherwise kept them in order. He depended for his living chiefly upon Cameronian hospitality, which never failed him, had ever a melancholy mania for discoursing upon the persecutions of the hillmen, and died in poverty.

PATERSON, WILLIAM (1658-1719). A British financier, born in Dumfriesshire, Scotland. When a young man he removed to England and then went to the Bahama Islands. Returning to London, he engaged in trade and soon acquired a considerable fortune. Paterson is chiefly famous for having been the originator of the Bank of England and for having projected the Darien scheme. His first overtures to the government for the establishment of the bank were made in 1691, but it was not until 1694 that Parliament adopted his plan and passed the Act creating for 10 years the corporation called the Governor and Company of the Bank of England. Paterson was one of the original stockholders and a director of the bank, but in less than a year he resigned and soon afterward took up the more visionary Darien scheme (q.v.). Removing to Edinburgh, he succeeded in persuading the Scottish Parliament to pass the Act of 1695, which created the Company of Scotland trading to Africa and India, under the management of which

the settlement at the Isthmus of Darien was made. Paterson, who had, because of a quarrel with the directors, accompanied the expedition merely as a private individual, lost his wife by death and suffered greatly from hardships and sickness. Upon his return to England he was an active and influential advocate of the union between Scotland and England and had a considerable share in framing the articles of the treaty relating to trade and finance. In consideration of his public services the united Parliament of 1708 recommended that he be given an indemnity for his losses in the Darien undertaking, but this was not done until 1715, when he received £18,241. Paterson published anonymously more than 20 works on finance, colonial enterprises, legislative union, and other subjects. His *Works* have been collected by Bannister in three volumes (London, 1859). Consult also Bannister, *Life of W. Paterson* (Edinburgh, 1858).

PATERSON, WILLIAM (1745-1806). An American statesman and jurist, born in Antrim, Ireland. He came to America when very young, graduated at the College of New Jersey (Princeton) in 1763, studied law, and was admitted to the bar in 1769. In 1776 he was a member of the Legislative Council of New Jersey and of the State Constitutional Convention. The same year he was elected Attorney-General and served until 1783, the close of the Revolution, when, finding that his duties could properly end, he resigned. He was a delegate to the Continental Congress in 1780-81 and in 1787 to the National Constitutional Convention. Here, as a representative of the smaller States, who feared to enter a union in which population or wealth should govern representation, he proposed (June 13) the famous "New Jersey plan." (See *NEW JERSEY, History*.) This provided for a single legislative house in which each State should have one vote, an Executive Council removable by Congress, and a supreme judiciary to be elected by Congress. The national government should have power to regulate commerce, levy import duties, and, if necessary, make requisitions for money upon the States. He was one of the first Senators from New Jersey in 1789, but resigned in 1790. From 1791 to 1793 he was Governor of the State, and the town of Paterson was named in his honor. In 1793 Washington appointed him an associate justice of the Supreme Court, on which he served until his death. A collection of his letters has been published under the title *Glimpses of Colonial Society and the Life at Princeton College, 1766-1773, by One of the Class of 1763*, edited by Mills (Philadelphia, 1903).

PATERSON, WILLIAM (1839-1914). A Canadian statesman. He was born at Hamilton, Ontario, and was educated in that city. After some years of business training he became a manufacturer in 1863. Entering municipal life, he served as mayor of Brantford (1872-73), after which he took an active part in Dominion politics and was a Liberal member of the House of Commons from 1873 until 1911. In 1896 he was appointed Controller of Customs in the Laurier administration and took a prominent part in framing the customs tariffs of 1897 and 1907. He was Minister of Customs (1897-1911) and on several occasions was acting Minister of Finance. In 1902 he was one of the Canadian delegates to the Imperial Colonial Conference, London, and in 1909 was appointed Royal Commissioner concerning improved trade relations

between Canada and the West Indies. With William Stevens Fielding (q.v.), Paterson conducted at Washington the Canadian side of the negotiations in the Taft-Fielding reciprocity agreement in 1911. In the same year he retired on the defeat of the Laurier administration.

PATERSON, WILLIAM ROMAINÉ (1871-). A British novelist, better known by his pseudonym, Benjamin Swift. He was born in Glasgow, studied a year at Lausanne, and graduated from Glasgow University. His books are: *Nancy Noon* (1896); *The Tormentor* (1897); *The Destroyer* (1898); *Siren City* (1899); *Dartnell* (1899); *Nude Souls* (1900); *The Eternal Conflict: An Essay* (1901); *Sardon* (1902); *In Piccadilly* (1903); *Gossip* (1905); *The Nemesis of Nations* (1907); *The Death Man* (1908); *The Old Dance Master* (1911); *Lady of the Night* (1913). Of these the earlier were overfanciful or consistently disagreeable in matter, and in manner imitations of Meredith, but with *Siren City* he struck an original note.

PATHANS, pā-thānz'. One of the names of the Afghan peoples of the borderland of Hindustan and Afghanistan. The Indian Pathans have been of considerable historical importance, and the less cultured tribes have at times fought desperately against the British. Consult: Bellet, *The Races of Afghanistan* (London, 1880) and *Inquiry into the Ethnography of Afghanistan* (ib., 1891); Oliver, *Across the Border, Pathan and Biloch* (ib., 1890).

PATHELIN, pāt'lān', **PATELIN**, or **MAÎTRE PATELIN**. A noted French farce, composed probably at Rouen about 1464. Pathelin is a tricky lawyer, whose dishonest shifts form the staple of the action. It was worked over in modern style by Brueys and Palaprat (1706) as *L'Avocat Patelin* and had great success and in 1872 by E. Fournier. From their dialogue comes the familiar phrase *Revenez à vos moutons*, used there to recall Pathelin to the sheep whose disappearance is under discussion. Consult Richard Holbrook, *Master Pierre Patelin* (Boston, 1914).

PATH-FINDER. A name given to Gen. John Charles Frémont (q.v.) on account of his success in exploring the passes of the Rocky Mountains.

PATHFINDER, THE. A novel by James Fenimore Cooper (1840). It is the third in the *Leatherstocking Series* and continues the career of Natty Bumppo under the name of the Pathfinder.

PATHOLOGICAL ANATOMY (from Gk. *πάθος*, *pathos*, disease + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The branch of anatomy which treats of organs, tissues, and cells as changed from the normal by disease. It is usually studied in connection with the causative disease, and therefore in this work the pathological changes occurring during a disease are described in the article which treats of that disease.

PATHOL'OGY (from Gk. *πάθος*, *pathos*, disease + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The study of disease as a province of scientific knowledge; pathological physiology. Disease is well defined as "the expression of the sum of abnormal cell activities." (Schmaus.) Such activity disturbs the regular cell life in one of three directions: nutrition, function, or multiplication. It is evident, then, that pathology is, equally with physiology, a department of biology.

Many theories of disease and its causation are found in the history of medicine. Greek physicians, even before Hippocrates (c.460-357 B.C.), spoke of humoral pathology. Corresponding to the four elements, earth, air, fire, and water, there existed, according to their theory, the four qualities, dry, cold, hot, and moist. These qualities with the four elements formed the four humors of the body, blood, phlegm, yellow bile, and black bile. Galen (130-c.201) elaborated and advanced the humoral pathology of Hippocrates. Health he conceived to be the due combination, or "crasis," of the four humors, while illness he considered was the result of a disturbance of this condition. During favorable progress of disease these humors underwent a change, or "coction," which was taken as a sign of returning health and as a preparation for the "crisis," when an expulsion of morbid matter occurred. The humoral pathology was long in vogue. Jacques Dubois (Sylvius) (1478-1535), Ambroise Paré (1510-90), and Boerhaave (1668-1738) championed a new pathology. Sylvius and later Boerhaave asserted that the iatrochemical "acidities" of the fluids played a most important rôle. They classified acid, saline, oleaginous, glutinous, alkaline, and mixed acidities, which were supposed to originate in the food and to be especially active in chronic diseases. Francis Glisson (1597-1677) advanced the theory of "irritability," attributing it to both solids and liquids, which was much improved and amplified by Albrecht von Haller (1708-77). Life itself was considered to be irritability. Friedrich Hoffman (1660-1742) originated the "solidist pathology." He asserted that disease was "a marked disturbance in the movements of the solids and the fluids." In these disturbances the solids are the active and the fluids are the passive agents. Excessive movement produces "spasm," and defective movement produces "atony." Disease, he admitted, "might be due to alteration in the humors, and especially to a gradual thickening of the vessels, which tends at once to hinder their free circulation and to prevent the excretion of waste products." His four main sources of disease were, therefore, spasm, atony, altered humors, and deficient excretion. Paul Joseph Barthez (1734-1806) launched the mystic and vague vitalistic pathology. He assumed the existence of a "vital principle," neither soul nor body. Disease he asserted to be the effort of the vital principle to resist harmful agencies, or to be due to "a morbid idea manifesting itself by alterations in sensibility, abnormal movements, or an aberration in those acts which regulate the chemical constitution of the humors."

It was reserved for Virchow (q.v.) in 1858 to enunciate clearly and elaborate convincingly the cellular pathology, now accepted the world over and forming the basis of a universal view of the organs and the diseases which affect them.

The complex human organism may be reduced to very simple elements, the cells and the intercellular substance to which they give origin. All parts of all organs and tissues are composed of cells or products of cells. Blood and lymph are tissues, differing from muscular or fibrous tissues in that they have fluid intercellular substance. Cells are the conductors of vital functions, normal or abnormal. Their condition changes with age, disease, and fatigue, on the one hand, and reparation and nutrition on the other.

Pathological conditions affect an organ in one

of two ways, as an increase or as a decrease in vital activity. Hence such conditions may be divided into two classes, the retrogressive and the progressive disorders. It is obvious that each of these processes involves functional as well as anatomical differences and abnormalities. Between the two processes seems to stand the condition of arrest of development, due to mechanical causes or to interrupted vascular supply. If development begins but is arrested, the condition is termed aplasia. If the arrest is partial, the condition is termed hypoplasia. If an organ is wholly undeveloped, the condition is termed agenesis.

The pathologist's attention is fixed largely upon the nature of anatomical changes found, and the explanation of their occurrence. These changes are termed lesions, and upon more or less accurate idea of their nature and extent depend the success of measures taken for the relief of disease. Having established a conception of the lesions present, the investigator turns to their cause. The inquiry as to causation is embraced in the branch of pathology termed etiology. This department includes not only the study of vegetable organisms (bacteria) and animal organisms (such as plasmodia) and mineral toxins and their agency in producing lesions, but also the study of reaction following the activity of the agent. This reaction depends in some measure upon the developmental disorder present, or the inherited dispositions of the tissues as to resistance or susceptibility. Inherited conditions are largely speculative and inferential, and this factor of etiology is of less importance in the analysis of disease. The essential feature of the whole matter is the adequate comprehension of the abnormal expression of cellular life. There are, then, three subdivisions of pathology: etiology, or the study of causes of disease; morbid anatomy, or the study of structural changes in disease; and morbid physiology, or the study of disturbances of function, including morbid chemical action.

Pathology naturally separates into two great divisions: (1) general pathology, or the study of morbid conditions which are common to several different diseases; (2) special pathology, or the study of individual diseases. To illustrate, fever is a morbid condition which enters into a number of diseases and therefore belongs to the realm of general pathology; while the study of the lesions of typhoid fever, an individual disease, belongs to special pathology. The study of the gross and microscopic anatomy of diseased tissues are termed respectively gross pathology and pathological histology.

General Pathology. Of prime importance to the pathologist is the study of disorders of circulation, whether (1) hyperæmia, arising from excess of supply or diminished escape of supply of blood; or (2) anæmia, a decrease of supply of arterial blood; or (3) hemorrhage (see BLEEDING); or (4) œdema (q.v.); or (5) thrombosis (q.v.), under which is to be considered embolism (q.v.), with consequent necrosis or relief by anastomosis.

Necrosis (q.v.) is a local death of tissue, due to circulatory disorder, thermic action, or inflammation. A regressive disorder of the life of cells in which there is diminished nutritive and functional derangement is degeneration, which appears in several forms. The degeneration may be parenchymatous (or albuminous), fatty, mucous, colloid, amyloid, hyaline, glyco-

genic, or hydropic, or may appear in the form of petrification or pigmentation. Some of these forms of degeneration are described in BRIGHT'S DISEASE. In some forms of degeneration products of imperfect metamorphosis accumulate within the cells. In others necrotic cells and tissue elements or foreign material collect between the cells. In still others there is a gradual degeneration of the cell elements and a deposition in their place of a new substance. Atrophy (q.v.), on the contrary, is essential loss of substance without deposit of pathological or foreign material. Each component part of the tissues shrinks in volume. Yet atrophy may be accompanied by deposits of various kinds and in such cases coexists with degeneration, as in arteriosclerosis (q.v.). Defective innervation, exhausting diseases, disuse, long-continued moderate pressure, or certain drugs may be the cause of atrophy in different tissues, and these causes must be weighed by the physicians in determining pathological conditions in the course of treatment of a diseased person.

Among the progressive processes, or those in which the vital activity of the organism is actually increased, the most important are the reproductive. Inherent in every cell is the tendency for reproduction. Stimulus of various kinds awakens this innate tendency, which results in production of new tissue of various forms. Closely allied to the reproductive energy are the stimulus and the power to repair, to replace lost parts. Should the process of rebuilding go on to an excess of mere replacement, or should regular physiological growth be excessive, and the result be an increase in size as well as an increase in number of the elements, the condition is termed hypertrophy (q.v.). The phenomena of irregular development are considered under MONSTROSITY. Under the influence of bacteria or chemical agents or unascertained causes, and accompanied by pronounced vascular disturbance, a certain progressive process results in inflammation (q.v.). Still another progressive process results in the formation of neoplasms, or new growths, constituted of tissues of a different kind from those adjacent and developing at their expense. Most of these formations are considered under TUMOR.

With this preliminary knowledge of the processes at work, it is usual, in taking up the study of special pathology, to consider first the diseases of the blood, next those of the lymphatic tissues, then those of the various systems with their organs—respiratory, gastrointestinal, urinary, and reproductive—and then the diseases of bones and of joints, of voluntary muscles, of the brain and its membranes, of the spinal cord and its membranes, and of the peripheral system of nerves.

To bacteria are ascribed the production of lesions, and they certainly influence chemical and physiological processes locally and systematically. To their agency are ascribed pneumonia, diphtheria, cholera, leprosy, bubonic plague (qq.v.), etc. Animal parasites also play an important rôle in the production of pathological conditions. Among them are the *Amœba coli*, the *Mamatozoon malariae*, etc. There are also parasitic worms which produce diseases, e.g., tapeworm, lumbricoid, filaria (qq.v.), etc.

Preëminent among the many phases of pathological investigation during the last few years are the behavior of the blood in its reaction to bacterial and other toxins (see IMMUNITY).

the relation of the ductless glands to the body metabolism in health and disease (see ORGANO-THERAPY; SECRETIONS, INTERNAL); and the identification of new microorganisms as causes of diseases hitherto only suspected to be of bacterial origin, e.g., infantile spinal paralysis, as well as the methods of transmission. The special pathology of the different diseases is considered under the proper title for each disease.

Horder, *Clinical Pathology in Practice* (Oxford, 1911); Adami and McCrae, *A Textbook of Pathology* (2d ed., Philadelphia, 1914); Delafield and Prudden, *Pathological Anatomy and Histology* (10th ed., New York, 1914). See HISTOLOGY.

PATHOLOGY, MENTAL. See MENTAL PATHOLOGY; PSYCHOTHEAPEUTICS.

PATH'ROS. The Hebrew corruption of the Egyptian name for Upper Egypt, *Pa'to'rës*, literally "the South-land." It occurs in four passages of the Old Testament: Isa. xi. 11; Jer. xlii. 1-15; Ezek. xxix. 14, xxx. 14. The name was probably pronounced *Pathoris* by the Hebrews, as is indicated by the Greek rendering Παθόρης, and Φαθώρης. According to Cheyne (*Encyclopædia Biblica*, vol. iii), while the word means undoubtedly "Upper Egypt" as the passages now stand, it is much to be doubted if this was the meaning in the mind of the original writer. Since in Gen. x. 14 Pathrusim most probably is a distortion of *Sârêphâthim*, it is possible that Isa. xi. 11 is to be read "from Geshur and from Misrim," from *Zarephath*. The same change to Zarephath is most probable in the other references. In Assyrian it appears as *Paturisi*. The Pathrusim mentioned in Gen. x. 14 and 1 Chron. i. 12 belongs to the people of Pathros, or Upper Egypt. Consult Erman, in *Zeitschrift für die alttestamentliche Wissenschaft*, vol. x (Giessen, 1890), and *Encyclopædia Biblica* (London, 1902; see article "Pathros" by T. K. Cheyne).

PATIALA, püt'i-ä'lä. An eastern native state of the Punjab, India. Area, 3524 square miles. It has excellent timberland and produces grain, barley, wheat, maize, gold lace, iron and brass ware. Pop., 1901, 1,596,692; 1911, 1,407,659. Capital, Patiala.

PATIALA. The capital of a native Punjab state of the same name, India, 34 miles west of Ambala (Map: India, C 2). Pop., 1901, 53,545; 1911, 46,974. There are about 5000 Sikhs; the rest are almost equally divided between Hindus and Mohammedans.

PATIENCE. A comic opera, the music written by Sir Arthur Sullivan to the words of Sir W. S. Gilbert (qq.v.), first produced in London, April 25, 1881; in the United States, Sept. 22, 1881 (New York).

PATINIR, pá'té'nér', or **PATENIER**, -nyá', JOACHIM (c.1485-1524). A Flemish landscape and historical painter, born at Dinant. He was probably the pupil of Gerard David at Bruges. Afterward he lived in Antwerp, where Albrecht Dürer painted his portrait in 1521. He was the first of the Flemish painters to make figures subordinate to the landscape in his pictures. He had little knowledge of perspective, and the small figures he introduced are fantastically grouped. He painted with extreme detail. Among his best pictures are: "Baptism of Christ," Vienna Museum; "Temptation of St.

Anthony," Madrid Museum; "Repose in Egypt," New York Historical Society.

PATIÑO, pa-tē'nyó, José (1666-1736). A Spanish statesman, born at Milan (then a duchy belonging to the King of Spain), of a distinguished Gallegan family. In 1707 he was appointed to the Royal Council of Military Orders and became a knight of Alcántara with the intendancy of Estremadura. He served as intendant of Cataluña (1711-18) and was made intendant of the navy (1717), in which position he rapidly built up that newly organized branch of Spain's military establishment. The King appointed him (1726) Secretary of the Navy, of the Colonies, and of Foreign Affairs. To these heavy duties were added the War portfolio (1730) and the premiership (1734), so that during the last 10 years of his life the most important branches of the public service were concentrated in his hands. And yet these enormous duties did not seem to surpass his capacity for hard work, and in every one of these departments of public office he made important reforms.

Consult William Coxe, *Memoirs of the Kings of Spain of the House of Bourbon, 1700-1788*, vol. ii (London, 1815), and Antonio Rodríguez Villa, *Patiño y Campillo* (Madrid, 1882).

PATKUL, pät'kul, JOHANN REINHOLD VON (1660-1707). A Livonian nobleman, prominent as an opponent of the Swedish power during the last part of the seventeenth century and the beginning of the eighteenth. He was born at Stockholm, where his father was then a prisoner of state, and after receiving a military education entered the Swedish army (1687) and rose to the rank of captain. His bold advocacy of the rights of the Livonian nobility, which the Swedish crown had suppressed, gained him the hatred of Charles XI, who in 1694 condemned him to mutilation and the loss of his estates. Patkul escaped and, in 1698, took service with Augustus the Strong, Elector of Saxony and King of Poland, as a member of the Privy Council. He was instrumental in bringing about the alliance of Russia, Poland, Saxony, and Denmark against Charles XII in 1700, but soon after left the Saxon court and entered the service of Peter the Great. In 1704 he was Russian Ambassador at Warsaw, where his outspoken criticism of the conduct of Augustus led to his being imprisoned. In the Treaty of Altranstädt, concluded between Saxony and Sweden in 1706, Augustus promised to surrender Patkul to Charles XII, but privately gave orders to the commandant of the prison to connive at his escape. Before this could be effected, however, a Swedish detachment entered Warsaw and Patkul was delivered into their hands. At Kazimierz, near Posen, on Oct. 10, 1707, Patkul was broken on the wheel and quartered as a traitor to his country. Consult Sjögren, *J. R. v. Patkul* (Stockholm, 1882), and Buchholz, *Beiträge zur Lebensgeschichte J. R. Patkuls* (Leipzig, 1893).

PATMORE, COVENTRY KEARSEY DIGHTON (1823-96). An English poet, born at Woodford, Essex. His earliest publication was a volume of *Poems* (1844), praised by Bulwer and utterly condemned by *Blackwood's* in an unsparing review. He also contributed to various periodicals, in particular to the *North British* and the *Edinburgh*, critical articles, which, although marked by valuable detached observations, are unsatisfactory because of his failure to understand work other than his own. It was he who

asked Ruskin to send to the *Times* the latter's famous letter in defense of the Pre-Raphaelites, and he wrote for the *Germ* an essay on *Macbeth*, and verse, including *The Seasons*. However, he was not much concerned with the Pre-Raphaelite movement, and latterly at least held no complimentary opinion of Rossetti. He was at one time a disciple of Tennyson, and in 1850 recovered the manuscript of *In Memoriam* from a cupboard in which it had been left. From 1846 to 1866 he was assistant in the printed-book department of the British Museum. In 1804 he became a convert to Roman Catholicism. His published verse includes: *The Angel in the House* (in part, 1854; complete, 1863; later ed., 1905); *The Unknown Eros and Other Odes, i-æææi* (1877); and *Poems* (in a definitive edition, with a treatise on English metrical law, 1886; reprinted, 1890, 1894, 1897). Of these the more pretentious are in narrative form, quite lacking in any unity of interest, but with fine isolated passages, particularly descriptions of natural scenery, set in the mass of context. His triviality and baldness have been perhaps too monotonously dwelt upon by the critics, and the high esteem of eminent contemporaries is not wholly to be disregarded; but his work seems much less remarkable than his rugged and striking personality. Of his prose may be mentioned *Principles in Art* (1889; new revised and rearranged ed., 1898), essays reprinted from the *St. James's Gazette*, and *Religio Poetæ* (1893; revised and rearranged, 1898). He wrote, also, a memoir of the poet Procter, better known as Barry Cornwall (1877), and *Root, Root, and Flower* (1895), religious observations and meditations. There is an edition in his *Works* in five volumes (New York, 1907). Consult: Basil Champneys, *Memoirs and Correspondence of Coventry Patmore* (2 vols., London, 1900); E. W. Gosse, *Coventry Patmore* (New York, 1905); Paul Claudel, "Coventry Patmore," in *Etudes francoisaises*, vol. iii (Paris, 1914).

PATMOS (Lat., from Gk. Πάμος). An island in the Ægean Sea, one of the Sporades, about 28 miles south-southwest of Samos (Map: Greece, H 6). Area, about 15 square miles. The island is 10 miles long from north to south, and its greatest width is 6 miles. The most prominent physical feature of the island is its masses of volcanic hills, which rise 800 feet at their highest point. The island has borne no conspicuous part in history and owes its reputation to the reference made to it in the Bible (Rev. i. 9), where it is stated that Patmos was the place to which St. John was exiled and that there he received the visions contained in the Book of Revelation. The most important feature of modern Patmos is the monastery of St. John, founded in the eleventh century. Here was once gathered a very valuable library, many of the most important books in which have been sold. Under Turkish rule the condition of the island deteriorated. Patmos was taken by Italy in 1912 during the Turco-Italian War. In that year delegates from the Ægean islands met at Patmos and voted an address to the Italian government expressing their desire for union with Greece. Patmos remains (1915) under Italian rule. Pop., about 4000, mostly Greek.

PATNA, püt'ná. A native state of India, feudatory to Bengal. Area, 2399 square miles. Pop., 1901, 277,748. After having been for a number of years under British administra-

tion the state was restored to a dependant of its ancient Rajput rulers.

PATNA. A division of the Province of Behar and Orissa, Bengal (q.v.), British India, comprising the districts of Patna, Gaya, Shahabad, Saran, Champaran, Muzaffarpur, and Darbhanga. Area, 23,748 square miles. Pop., 1901, 15,614,987. The locality is watered by the Ganges and its tributary, the Son. The climate is extremely hot in summer and mild in winter. Rice, wheat, barley, and indigo are grown and the opium poppy is extensively raised. Capital, Patna (q.v.).

PATNA. The capital of a district and division of Behar and Orissa, British India, on the right bank of the Ganges, 332 miles northwest of Calcutta (Map: India, E 4). It covers a large area, stretching with its suburbs for 9 miles along the river bank; its streets are crooked and dirty and there are few interesting buildings. The Golah, a large, circular structure with walls more than 12 feet thick, originally built as a granary, is remarkable for its acoustic properties. The city has extensive bazars, contains the largest opium factories in India, has a large indigo trade, and after Calcutta is the most important city in Bengal. In the European quarter on the west are a Roman Catholic cathedral, Protestant churches, government offices, a government college, a school of engineering, the Nabob's palace, and the great tank.

Patna, under the former name of Palipatna, or Lotus City, is supposed to have been the capital of Behas as early as 419 B.C. Here at an early period the East India Company established factories and traded in opium, rice, etc. In 1763 disputes about transit duties arose between the company's servants and the native government. A war ensued, resulting in a massacre and British occupation of the district. Patna was the headquarters of the Wahabi or Mussulman conspiracy in 1864. It lies on the principal railroad of the Ganges valley, and also has considerable shipping on the river. Pop., 1901, 134,785; 1911, 136,153, most of whom were Hindus, with about 40,000 Mohammedans and 500 Christians.

PATON, JOHN BROWN (1830-1911). A British Congregational minister, born at Gals-ton, Ayrshire. He studied at Spring Hill College, Birmingham (succeeded by Mansfield College, Oxford), and graduated from London University (B.A., 1849; M.A., 1854). In the latter year he took up ministerial work in Sheffield. When Cavendish College at Manchester was opened in 1861 Dr. Paton became connected with it, and on the removal of the institution to Nottingham (1863) as the Congregational Institute, he accepted the principalship. He retired in 1898. His publications include: *The Origin of the Priesthood in the Christian Church* (1877); *Christianity and the Wellbeing of the People* (1885; 2d ed., 1900); *The Two-fold Alternative* (1889; 4th ed., 1909); *Present Remedies for Unemployment* (1909).

PATON, JOHN GIBSON (1824-1907). A British missionary, born near Dumfries, Scotland. "The Cotter's Saturday Night" illustrates well his early home life. Self-support devolving on him before he was 12 years old, he persisted, despite many hardships, in earning his way through school, college, and divinity hall. In 1858 he sailed for the New Hebrides with his devoted wife, who died, with their only child, in

the following year. On the island of Tanna, inhabited by cannibals, he had a long and desperate struggle to plant the gospel. An indomitable energy was Paton's inheritance from Covenanters forefathers; his escapes from death were many and often marvelous. Better success attended his efforts on the neighboring island of Aniwa, which was entirely won to Christianity, but the whole cluster of islands was occupied by churches within Paton's lifetime. Meanwhile he repeatedly visited Australia with its sister colonies, and also the homeland, securing thousands of pounds for three successive missionary ships which plied among the New Hebrides. An apostolic fervor of spirit drew men enthusiastically to his support. In 1864 he was married to Margaret Whitecross, who was thereafter an ideal companion of his life and labors. It was in 1885 that he yielded reluctantly to the importunities of his youngest brother and consented to write out the story of his life. Hastily penned amidst engrossing duties in the southern islands and dispatched in fragments to his brother, this autobiography was carefully edited by the latter and published in two volumes in 1889, taking at once the place it has retained ever since in the first rank among intimate human documents. In 1892 Dr. Paton came to the United States, where he pleaded before vast audiences for a reversal of the national policy that tolerated the liquor traffic and the trade in firearms among the Melanesians. Victory in both these campaigns, though not immediate, cheered the veteran missionary some years before his death. Consult, besides the *Autobiography*, Margaret Whitecross Paton, *Letters and Sketches from the New Hebrides* (New York, 1895), and James Paton, *John G. Paton: Later Years and Farewell* (ib., 1911).

PATON, SIR JOSEPH NOEL (1821-1901). A Scottish historical painter. He was born at Dunfermline, Scotland, and studied for a short time at the Royal Academy Schools, but was mainly self-taught. He received two prizes in the Westminster Hall competition (1845, 1847), and became a member of the Royal Scottish Academy in 1850. In 1866 he was appointed Queen's limner for Scotland and in 1867 he was knighted. Paton made the cartoons for the glass of the great windows of Dunfermline, restored in 1884 by Andrew Carnegie. His subjects are drawn from fairy tales, history, poetry, and religious lore, but his interest in them was literary and sentimental rather than pictorial, and though exceedingly popular in his own day and displaying fertile invention and deft and accurate technique, his paintings are deficient in design and handling and harsh in color. His chief works include: "The Spirit of Religion" (1845); "The Quarrel of Oberon and Titania" (1846) and "The Reconciliation of Oberon and Titania" (1847), both in the National Gallery, Edinburgh; "Home from the Crimea" (1856); "Luther at Erfurt" (1861).

PATON, LEWIS BAYLES (1864-). An American theologian. He was born in New York City, graduated from New York University in 1884 and from Princeton Theological Seminary in 1890, and studied at Berlin (1890-92) and at Marburg (Ph.D., 1897). In 1890 he was ordained to the Presbyterian ministry, two years later becoming a Congregationalist. At Hartford Theological Seminary Paton was instructor in Old Testament exegesis and criticism in 1892-93, associate professor from 1893 to

1900, and thereafter Nettleton professor. In 1903-04 he directed the American School of Oriental Study and Research in Palestine. Besides editing *Recent Christian Progress* (1909) he is author of *The Early History of Syria and Palestine* (1901); *Jerusalem in Bible Times* (1908); *The Early Religion of Israel* (1910).

PATOS, pã'tosh, LAGOA DOS. A lake in Brazil. See LAGOA DOS PATOS.

PATRAS, pã'trás, or **PATRÆ**. A fortified seaport of Greece and the capital of the Nomarchy of Achaia, situated in a fertile plain on the Gulf of Patras (Map: Greece, C 5). The town is dominated by a citadel-crowned ridge, the site of the ancient acropolis. It was rebuilt, after Greece had acquired its independence in the nineteenth century, with wide and straight streets, and has a fine church and post office, a high school, and ruins from ancient Greek and Roman times. The harbor is only a roadstead, protected by a breakwater, but the town is, nevertheless, an important trade centre and the seat of a United States consul. The chief exports are currants, wine, oils, valonia, and skins. Pop., 1889, 33,529; 1907, 37,724. Patras was one of the foremost among the twelve cities of Achaia. At the time of the Slav invasion of the Balkans many Greeks sought refuge within its walls. During the Middle Ages it became the chief commercial city of the Peloponnesus. It was the first Greek city to revolt against the power of the Turks, by whom it was destroyed in 1821.

PATRES CONSCRIPTI. See CONSCRIPT FATHERS.

PATRIA POTESTAS (Lat., paternal power). The power of the father over his children in early Roman law was similar to that which existed among other Aryan peoples at the same stage of social development. (See PARENT AND CHILD.) What was peculiar in later Roman law was the extent to which this early power was maintained even at an advanced stage of civilization, and the duration of the power, in the case of sons, until the father's death. Daughters passed out of the paternal power upon marriage, but sons remained subject even after their marriage. The son had no *potestas* over his children until his father's death. *Patria potestas* was thus the authority not merely of the father over children, but of the paternal ancestor over all descendants in the male line (son's children, son's son's children, etc.).

In early Roman law the father had an unlimited right to expose to death all infant daughters except the first-born. Sons and first-born daughters might also be exposed if they were deformed and the deformity were attested by five of the nearest neighbors. The father had also, as domestic magistrate, the right to punish his children, even with death, after a trial at which the kinsmen were present. These paternal rights existed throughout the Republican period, unchecked except by the arbitrary power of the censors and of the popular assembly to punish abuses of paternal power. In the Imperial period, however, exposure of children was forbidden and the right of punishment was reduced within reasonable disciplinary limits.

The father had also the right to sell the child. Sale into slavery was unusual; in the later Empire it was permitted only in the case of new-born children and only when the father was in extreme poverty, and even then he retained the right of ransom. To pledge the person of

a child for the father's debt (which was originally accomplished by sale with the right of ransom) was not uncommon, nor was this practice forbidden until the Imperial period. It was also not unusual for a father to sell his son's services for a number of years. A so-called royal law (i.e., a rule of the old religious law; see CIVIL LAW) forbade the sale of a married son; and another royal law declared that a son sold three times should be free from the father—a rule of which the jurists took advantage in devising a form of emancipation (q.v.). Sales of children for the purposes of emancipation or of adoption into a new family, and sales of daughters as a method of giving them in marriage, were of course purely formal.

Sons and daughters and their children under *patria potestas* had no property of their own; whatever they acquired was acquired for the head of the house. In the Imperial period, however, the son and also the daughter obtained property rights.

With the development of the legal recognition of the child's right to life came the recognition of his right to support. With the development of independent property rights of the child came the duty to support an indigent parent.

Even at early Roman law there was one field in which sons were independent, viz., that of public law. The son under paternal authority had political rights and was eligible to office, and, if clothed with official power, he could control the actions of the father.

Paternal authority existed only over children born to the father in lawful marriage. In the later Empire children born of a concubine (*fili naturales*) could be legitimized by the subsequent marriage of their parents or by rescript of the Emperor. Children thus legitimized and children brought into the family by adoption (see ADOPTION) were subject to *patria potestas*.

Patria potestas was extinguished not only by the death of the father, but also by his loss of liberty or citizenship. His capture and enslavement by foreign enemies, however, only suspended his paternal authority, and if he escaped or was ransomed it revived. The practical meaning of the rule was that condemnation to any penalty which carried with it loss of freedom or of citizenship destroyed *patria potestas*. Forfeiture of paternal authority was also imposed, by Imperial legislation, on the father who exposed his child or prostituted his daughter. The marriage of a daughter extinguished her father's authority as long as marriage carried the woman into the power (*manus*) of her husband, but when the free marriage was developed the married woman remained under her father's authority. Even in such a marriage, however, her children were under the paternal authority of her husband or of her husband's father. Paternal authority was extinguished, in the older Roman law, when a son became a flamen of Jupiter or a daughter became a vestal virgin. In the law of Justinian the same result attached to the elevation of the son to the episcopate or his appointment to any important secular office. Finally, paternal authority was extinguished when the son or daughter was voluntarily emancipated or transferred to an adopted father. The emancipation of children originally deprived them of all right of inheriting property in their original family except by testament; but this result was obviated, as regarded the father's estate, by the prætorian edict, and, as regarded the estates of brothers,

sisters, and paternal relatives, by Imperial legislation. See EMANCIPATION; FAMILY; MANUMISSION; SLAVERY; and consult the authorities referred to under CIVIL LAW.

PATRIARCH (Lat. *patriarcha*, *patriarches*, from Gk. *πατριάρχης*, patriarch, chief of a tribe, from *πατρία*, *patria*, lineage, from *πάτρις*, *pater*, father + *ἀρχεῖν*, *archein*, to rule). 1 The head or ruler of a family; used especially of the Hebrew ancestors, Abraham, Isaac, Jacob, and the sons of Jacob, and of the names of the progenitors of the race as given in the antediluvian period of the Biblical narrative. See METHUSELAH.

2. In the history of the Christian Church the title is applied to the bishops of certain great metropolitan sees of a wider jurisdiction than other metropolitans. The three earliest instances seem to be directly connected with a tradition of the establishment of those sees by St Peter. These are the three which the First Council of Nicaea asserts to be recognized by ancient custom—Rome, Antioch, and Alexandria. After the translation of the seat of empire to Byzantium, thenceforward called Constantinople, that see, which had originally been subject to the Metropolitan of Heraclea, obtained first metropolitan and then patriarchal rank, and eventually established a precedence over Antioch and Alexandria, being ranked second only to Rome. To these four patriarchates was added in 451 that of Jerusalem, which was formed by the Council of Chalcedon out of the ancient patriarchate of Antioch. The limits of these five patriarchates can only be loosely assigned. These patriarchs had authority to consecrate the metropolitans under their jurisdiction and to preside over councils and high judicial tribunals within the same limits. After the Greek schism, and particularly after the establishment of the Latin Kingdom of Jerusalem, Latin prelates were appointed with the rank and title of patriarch in each of the four great Eastern sees. Since then there have been a number of patriarchs in the East—among the Greek Orthodox (one for Russia, created in 1589 and removed by Peter the Great), among the Nestorian, Jacobite, Armenian, and Coptic communities, and among those who have returned to union with Rome.

Besides the five greater patriarchates there have been others in the West known by the name of minor patriarchates. The controversy of the Three Chapters (see CHAPTERS, THE THREE) gave the Bishop of Aquileia an opportunity to assume this title, whereupon the orthodox Bishop of Grado asserted an equal right to it. It remained in the former line even after the first bearer made his submission, until Benedict XIV abolished it; that of Grado was transferred to Venice in 1451. In France the Bishop of Bourges at times claimed the title, and Napoleon had the idea of creating a French patriarch. Pope Paul III granted the dignity of Patriarch of the Indies to the grand chaplain of the King of Spain, and the King of Portugal asked a similar dignity for his grand chaplain, with his see in Lisbon. As a matter of fact, by the Concordat of 1886, which regulated the relations between church and state in the Portuguese East Indies, the honorary title was conceded to the Archbishop of Goa. For the Eastern patriarchate, consult K. Lübeck, *Reichseintheilung und kirchliche Hierarchie des Orients* (Münster, 1901).

PATRIARCHAL CROSS. A cross which, like the patriarchal crossier, has its upright part

crossed by two horizontal bars, the upper shorter than the lower.

PATRIARCH'ATE. 1. The rule or jurisdiction of a father. 2. Any social group, as a family, a clan, or a tribe, living under the rule of a father or eldest male member of the group. The term stands for an important stage in the development of human society and for an important theory commonly called the patriarchal theory. In nomadic communities, and often in simple agricultural populations, there are found compound families, in which two or three generations of relatives, including many brethren with their wives and children, live together under the rule of the eldest male and in the common ownership of a household property. The society of the ancient Hebrews in the very early days is described in the Old Testament as patriarchal. The nomadic tribes of the Arabian desert and of the steppes of Central Asia are patriarchal now. The family and clan organization of the ancient Greeks and of the ancient Romans was patriarchal and a large proportion of the Slavic population of Russia and of southeastern Austria is patriarchal still. In its simplest form the patriarchal theory is stated by Aristotle in the opening pages of *The Politics*. Society is represented as springing from a single family, consisting of a man and his wife and children. The children and children's children continue to live with the first father, acknowledging him as chief or patriarch as long as he lives. On his death his descendants divide into as many families as he has sons with offspring. Each such son becomes the patriarch of a new compound family. In the course of time many such related families, living in one district and speaking one tongue, become a tribe. Tribes enlarging divide, but if they do not separate too far they presently confederate and become a nation. This simple theory underwent great modification through the researches of Sir Henry Sumner Maine, who in *Ancient Law* (London, 1861, new ed., New York, 1907) showed that the patriarchal family of the Romans was a partly natural, partly artificial group held together by the supreme power (*potestas*) of the eldest male. Membership in the group might be acquired through adoption as well as by actual descent from the first father, and it could not be acquired through blood relationship on the side of the mother. Neither males nor females not subject to the father's power were accounted as of the group, and property descended only through kinship in the male line. The group was thus essentially not a compound family, but, rather, a clan or gens (See GENS). Maine attempted to prove in this work, and later in *Early Law and Custom* (London, 1891), that this highly artificial patriarchal system had been general among Aryan peoples. A destructive criticism of Maine's theories by John F. McLennan, *The Patriarchal Theory*, edited and completed by Donald McLennan, was put forth (London) in 1885. In this work it was shown that the patriarchal family has everywhere been preceded by the clan and family system based on kinship through females, and that the true *patria potestas* has been of exceptional occurrence, even after the patriarchal system has been established. Substantially the same conclusions are maintained by W. Robertson Smith, *Kinship and Marriage in Early Arabia* (London, 1885; new ed., 1903). An exceedingly interesting and instructive account of the economic aspect of

patriarchal institutions, especially in Slavic communities, is found in E. de Laveleye, *De la propriété et de ses formes primitives* (Paris, 1874; Eng. trans. by G. R. L. Marriott under title of *Primitive Property*, London, 1878). The most satisfactory treatment of the patriarchal theory in the light of recent research and with reference to C. N. Starcke, *The Primitive Family* (New York, 1899), and E. A. Westermarck, *The History of Human Marriage* (London, 1891; new ed., New York, 1912), is found in G. E. Howard, *A History of Matrimonial Institutions*, part i of vol. i (Chicago, 1904). See MARRIAGE; MATRIARCHATE.

PATRIARCHS, TESTAMENTS OF THE. See APOCRYPHA, *Old Testament*.

PATRIARCHS, TESTAMENTS OF THE TWELVE. See APOCRYPHA, *Old Testament*; APOCALYPTIC LITERATURE.

PATRICIAN, pà-trish'an (Fr. *patricien*, from Lat. *patricius*, of the rank or dignity of the fathers, from *pater*, Gk. *πάτερ*, *patēr*; connected with Goth. *fadar*, OHG. *fatar*, Ger *Vater*, AS. *fæder*, Eng. *father*). A name given to the members of the original Roman *gentes* (see GENS), of whom the *populus Romanus* consisted, and to their descendants by blood and adoption. The patricians were thus those who could point to definite fathers or forebears, i.e., those of blood and consequent social and political standing. The amalgamation of the three tribes of Ramnes, Tities, and Luceres gave rise to a distinction between *patres majorum gentium* and *patres minorum gentium*, the latter term being applied to clans recently elevated to an equality with the old patrician class. A recent theory makes the patricians originally a Sabine race that conquered a Ligurian people established on the site of Rome; by this theory the plebeians were survivors of the conquered Ligurians, with a family organization less highly developed than that of the conquering Sabines. On the establishment of the plebeians as a distinct order, sharing certain rights with the patricians, the patriciate became an aristocracy of birth, in the exclusive possession of a number of important privileges. A long struggle between the two orders ended in the attainment by the plebeians of a political equality and the establishment of a new aristocracy of *nobiles* based on wealth and office. From 300 B.C. the old political distinction between patricians and plebeians had no real existence, except that patricians were ineligible to the tribunate of the plebs. The Empire made an end even of this relic of earlier days. Under Constantine the dignity of *patricius* became a personal title, not hereditary, but conferring very high honor and certain privileges. It was created at Constantinople, and not confined to Romans or subjects of the Empire, but sometimes bestowed on foreign princes. These patricians, unlike the old Roman order, were distinguished in dress and equipage from the ordinary citizens. The popes in after times conferred the same title on eminent persons and princes, including many of the German emperors. In several of the Germanic kingdoms the title of patrician was bestowed on distinguished subjects, and in some parts of Italy the hereditary nobility are still styled patricians. Consult: For discussion of various views of the origin of the patricians and the plebeians, G. W. Botsford, *The Roman Assemblies* (New York, 1909). For the mediæval patriciate, J. B. Bury, *Later Roman Empire* (London, 1899); Bryce, *Holy Roman*

Empire (new ed., New York, 1911). For the patriciate in German territory, Foltz, *Beiträge zur Geschichte des Patriciats in den deutschen Städten* (Marburg, 1899). See PLEBEIANS; ROME.

PATRICK, ALBERT T. (?-). An American lawyer, born in Texas. After a sensational trial of more than nine weeks he was convicted on March 26, 1902, of instigating the murder (Sept. 24, 1900) of William Marsh Rice (q.v.), an aged New York millionaire. It was charged that Patrick sought to gain control of Rice's property by means of a forged will. On April 7, 1902, he was sentenced to die. The electrocution was to have taken place in the following month, but by an extraordinary series of delays and appeals, managed largely by Patrick himself, he was still alive in December, 1906. At this time his sentence was commuted by Governor Higgins to life imprisonment and in 1912 he was pardoned by Governor Dix. Two years later it became known that more than \$162,000 had been spent by Patrick and his friends during his long fight. His wife never ceased in her efforts to save his life and then to secure his pardon.

PATRICK, MARY MILLS (1850-). An American college president, born at Canterbury, N. H. She studied at Lyons College, Iowa, in 1866-69 and received the degree of A.M. from the State University of Iowa in 1890. In the latter year she became president of the American College for Girls in Constantinople. Between 1892 and 1897, when she took her Ph.D. at Bern, she spent several years in Europe on leave, studying at various universities. She was a member of psychological congresses at Munich (1896) and Paris (1900) and of philosophical congresses at Paris (1900) and Bologna (1911). Miss Patrick is author of an *Armenian Translation of a Text-Book of Physiology* (1876); *Seatus Empiricus and Greek Skepticism* (1889); *Sappho and the Island of Lesbos* (1912).

PATRICK, SAINT (†389-461). The apostle of Ireland. The known facts of his life are so meagre and so surrounded by legend that nearly every event from his birth to his burial has received various interpretations. His father was named Calpornius, a Briton, a deacon, and the son of a presbyter, evidently a man of some property, as his office of decurion, or member of municipal council, indicates. Patrick was born in Banneventa, the locality of which has been disputed. Tradition placed it at Dunbarton, Scotland, but it was more probably in southwestern Britain, not far from the Irish Channel. His British name was Succat, but perhaps from childhood he bore also the Roman name Patricius. When 16 he was taken captive in an Irish raid on Britain and carried to Ireland. In his autobiography he says that his master lived "nigh to the western sea," which would place the location of his service in the Kingdom of Connaught. Later tradition placed it in northern Dalaradia, near Mount Miss, the modern Slemish, in County Antrim, where he is said to have served a master named Milucc. After six years of slavery, impelled, he says, by visions, he escaped and, after some difficulty, gained an opportunity to work his passage to the Continent. After a voyage of three days he and his fellow voyagers landed on a coast which must have been western France, though he does not name it. Thence they traveled 38 days before they came to human habitations. They suffered

much from hunger, and again visions came to Patrick. This strangely desolate land may have been southwestern Gaul, lately devastated by the Vandals, who had passed thence into Spain. At length Patrick separated from the rough pagan sailors and found a refuge in the island monastery of Lérins, off the coast of Provence. Here he remained for a few years, but did not become a monk. At this point also later tradition varies and places his sojourn with the famous Martin of Tours (q.v.), who some accounts even state was his mother's brother. He returned home and was joyfully received by his family, but soon a vision came again, this time calling him to preach the gospel in the land of his captivity. He regarded the dream, which doubtless reflected his own meditations, as the voice of God, went to Autissiodorum (Auxerre) in Gaul for further preparation, and was shortly after ordained deacon by the Bishop, Amator. It was at least 14 years before he went to Ireland, though the cause of this long delay is not known. At last, in 432, he was consecrated Bishop of Ireland, upon the death of the former Bishop, Palladius, and went to his long-desired missionary field with the prestige of authority and office. The Christian communities were doubtless near the western and southern coasts, but Patrick had no intention of confining his work to the communities already Christian. His mission was to convert the pagans of Ireland, and he labored in various parts of the island. He probably landed near Wicklow, but tradition laid his first extensive labors in southern Dalaradia, in County Down, on the shores of Lake Strangford. Ireland was divided into petty kingdoms, with Loigaire in the position of high king, having a measure of authority over the other kings, and Patrick soon came into relations with him at Tara, his capital. The king did not become a Christian, but his brother, Conall, was converted and, in spite of vigorous Druid opposition, Patrick gained royal protection and favor. He is said to have founded many churches in County Meath. Thence he went into Ulster, and thence journeyed into Connaught, perhaps on three occasions. Tradition connects him with churches in Trim, Dunshaughlin, Uisnech, Donaghpatrick, Aghamagh, Shancough, Tannach, Caiselire, and Crosspatrick. About 441-443 he went to Rome, where he secured the approval of Pope Leo the Great. In 444 he founded Armagh and made it the ecclesiastical centre of Ireland. Traces of his work in south-Ireland are less clear, though tradition claims some work in Leinster and Munster. In his old age he was the subject of bitter and unjust criticism and, it would seem, retired from the headship of the church some years before his death. He died at Saul in Dalaradia, the scene of his earlier labors, near the mouth of the river Slaney, in County Down. The church at Armagh long possessed two relics claimed to be his—a crosier, destroyed in the Reformation, and a four-sided iron bell, now in the National Museum at Dublin.

Tradition has embellished his story with many legends: he drove the snakes out of Ireland; he brought darkness upon his enemies; he overcame Druid sorceries by miracles; after his death there was no night for 12 days, and his body diffused sweet odors. Patrick was rightly venerated as the greatest missionary to Ireland, but to say that he "found no Christians in Ireland and left no heathen" is to err in both parts

of the statement. There were Christians before and pagans after him, but his work insured the speedy and complete triumph of Christianity over the Druid religion.

Patrick was emphatically a man of deeds and not of words, and so his literary remains are few, though of great interest. First is his autobiography, which he calls his *Confession*. This was written in Latin, in which tongue he had become very rusty. Next comes his epistle to Coroticus, a Welsh prince, who had taken captive some of the Irish Christians. Patrick wrote to secure, if possible, their release. Finally, a hymn in Irish, called the *Lorica*, which is a confession of faith, may possibly be his work. Other remains bearing his name have not such good claim to be called genuine. All his remains, genuine and disputed, are in Migne, *Patrologia Latina*, liii; also in better shape with the *Tripartite Life*, one of the sources of his biography, in the "Roll Series," No. 89, two parts, edited by Whitley Stokes (London, 1887). For English translations of his genuine works and notes, consult: T. Olden, *Epistles and Hymns of St. Patrick* (Dublin, 1876; 3d ed., 1895); C. H. II. Wright, *The Writings of Patrick, the Apostle of Ireland* (London, 1889; new ed., 1909); N. J. D. White, "The Writings of St. Patrick," in *Proceedings of the Royal Irish Academy* (Dublin, 1904). For his life, consult: J. H. Todd, *St. Patrick, the Apostle of Ireland* (Dublin, 1861); Miss Cusack, *Life of St. Patrick, Apostle of Ireland* (London, 1871, with a translation of the *Tripartite Life* from the original Irish by W. M. Hennessey); J. F. Shearman, *Loca Patriciana: An Identification of Localities Chiefly in Leinster Visited by St. Patrick* (Dublin, 1882); W. B. Morris, *Ireland and St. Patrick* (London, 1888); E. J. Newell, *St. Patrick, His Life and Teaching* (ib., 1890); John Healy, *The Life and Writings of St. Patrick* (Dublin, 1905); J. B. Bury, *Life of St. Patrick and his Place in History* (London, 1905).

PATRICK, SAINT, ORDER OF. See SAINT PATRICK, MOST ILLUSTRIOUS ORDER OF.

PATRICK, SIMON (1626-1707). A Church of England divine. He was born at Gainsborough, Lincolnshire, and graduated from Queens' College, Cambridge, in 1648. He took orders and in 1655 was received as chaplain into the family of Sir Walter St. John, of Battersea. In 1662 he was appointed rector of St. Paul's, Covent Garden, London, and endeared himself to his people by faithful instructions and especially by remaining with them during the plague of 1665. In 1671 he was made chaplain in ordinary to the King. In 1672 he was made prebendary of Westminster and in 1679 dean of Peterborough. During the reign of James II he defended the Reformation. In 1689 he was made Bishop of Chichester and in 1691 transferred to the see of Ely. In his early life he wrote against the Nonconformists, in a pamphlet entitled *A Friendly Debate between a Conformist and a Non-Conformist* (1669), but after he became Bishop he changed his opinion, regarded them with favor, and used his influence to allay strife. He stood next to Tillotson in learning and influence. Among his numerous works were: *Mensa Mystica, or A Discourse Concerning the Sacrament of the Lord's Supper* (1680); *The Heart's Ease, or a Remedy against Trouble* (1660); *The Parable of the Pilgrim* (1664); *The Christian Sacrifice* (1671); *The Dignity of the Christian Priesthood* (1704). His para-

phrases upon the books of the Old Testament from Genesis to Solomon's Song were published in 10 volumes between 1695 and 1710. They are included with the commentaries of Lowth, Arnold, Whitby, and Lowman, in *A Critical Commentary and Paraphrase on the Old and New Testament and the Apocrypha* (London, 1809). A complete edition of his works was published in 1858 by the Rev. Alexander Taylor, in nine volumes. His *Autobiography* was published at Oxford in 1839. A *Memoir* by T. Chamberlayne was published with *The Parable of the Pilgrim* (London, 1839).

PATRIOFELIS (Neo-Lat., from Lat. *patrus*, relating to a father, hereditary, ancient + *felis*, cat). A fossil creodont mammal found in the Middle Eocene (Bridger) beds of Wyoming and of interest because it is considered by some authors to be the ancestor of the modern seals. Other writers, basing their conclusions on more recent examination of the material, consider *Patriofelis* to have been a terrestrial creodont with habits similar to those of the cats and presenting a lateral line of evolution that seems to have no descendants among modern carnivores. The animal, as indicated by the finely mounted skeleton in the American Museum of Natural History, was of heavy build, about 6 feet in length, with low, crouching attitude, flexed limbs, and long tail. The skull is rather large, with small brain case and a prominent posterior crest. The powerful jaws are armed with sharp cutting teeth. The feet are digitigrade, with spreading clawed toes. *Oxyæna*, from the Wasatch Lower Eocene beds, is a more slender, less specialized ally of *Patriofelis*. Consult Wortman, "Osteology of *Patriofelis*, a Middle-Eocene Creodont," in *Bulletin of the American Museum of Natural History*, vol. vi (New York, 1894), and H. F. Osborn, "Oxyæna and *Patriofelis* Re-Studied as Terrestrial Creodonts," in *Bulletin of the American Museum of Natural History*, vol. xiii (ib., 1900).

PATRIOTIC SECRET SOCIETIES. See SECRET SOCIETIES.

PATRIOTIC SOCIETIES (ML. *patrioticus*, from Gk. πατριώτικος, *patriōtikos*, relating to descent or to a fellow countryman, from πατριώτης, *patriōtēs*, fellow countryman, from πατρία, *patria*, race, country, from πατήρ, *patēr*, father). Societies having as their objects the preservation of the records of important events in history and especially of the wars in which the United States has participated, the encouragement of love of country, the saving and restoration of historical sites and objects, the celebration of anniversaries of historic events, and the fostering of fraternal feeling and intercourse among veterans.

Of the Colonial period, the earliest of the hereditary patriotic bodies is the Society of Mayflower Descendants. (See MAYFLOWER DESCENDANTS, SOCIETY OF.) Similar to this is The Society of the Ark and the Dove, which admits to membership lineal descendants who came over either in the *Ark* or the *Dove* under Governor Calvert in 1633 and settled in Maryland. The Society of Colonial Wars admits to membership adult male descendants of Colonial ancestors of distinction. (See COLONIAL WARS, SOCIETY OF.) Similar to the foregoing is the Order of the Founders and Patriots of America. Besides Colonial ancestry, it requires that its members shall be descended from ancestors who were loyal to the Colonies during the War of the

Revolution. (See FOUNDERS AND PATRIOTS OF AMERICA, ORDER OF.) Of like character is the Settlers and Defenders of America (q.v.), which admits both men and women. The first patriotic hereditary society of women to be organized was the Society of Colonial Dames of America. It admits on invitation women who are directly descended from some ancestor of worthy life who resided in an American Colony before 1776. (See COLONIAL DAMES OF AMERICA, SOCIETY OF.) Broader in its scope is the National Society of Colonial Dames of America. It admits on invitation women who are descended from an ancestor of worthy life who resided in an American Colony prior to 1750. (See COLONIAL DAMES OF AMERICA, NATIONAL SOCIETY OF.) The Society of Daughters and Patriots of America admits to membership by invitation women who are descended in the direct paternal line of either father or mother from an ancestor who settled in the Colonies before 1687, and of an ancestor in the same line who was loyal to the Colonies during the War of the Revolution. The Order of Washington, which was organized on May 13, 1908, as an order of patriotism and chivalry, admits to membership descendants of ancestors who arrived in America prior to 1750 and who were landowners or who held some official military, naval, or ministerial office. In New York City there is the Holland Society (q.v.), which admits to membership male descendants in the direct male line of a man of Dutch blood resident in America before 1675.

Commemorating the period of the great struggle between the Colonies and Great Britain are a number of hereditary societies, of which the oldest and best known is the Society of the Cincinnati (q.v.), which admits to membership descendants of officers who served in the Continental army for at least three years. Following the centennial celebration of the battle of Lexington, there was organized in San Francisco, Cal., on Oct. 22, 1875, the Sons of Revolutionary Sires, which, on April 30, 1889, became the Society of the Sons of the American Revolution. (See SONS OF THE AMERICAN REVOLUTION, SOCIETY OF THE.) The Society of the Sons of the Revolution has priority over the previously mentioned society in the Eastern States and has almost identical requirements, for it admits to membership lineal descendants of participants in the War of the Revolution. (See SONS OF THE REVOLUTION.) Similarly the Naval Order of the United States (q.v.) admits to membership any officer, or descendant of one, who served in the naval forces of the United States during the War of the Revolution or any of the subsequent wars. Enlisted men who have received the naval medal of honor are also eligible to membership. One of the most distinguished among the patriotic societies is the Military Order of Foreign Wars, which admits to membership commissioned officers who participated in the foreign wars of the United States and their direct lineal descendants in the male line. See FOREIGN WARS, MILITARY ORDER OF.

Originally the Sons of the American Revolution admitted to membership women, but, this being found unsatisfactory, special organizations were instituted for women, the first of which was the Society of the Daughters of the American Revolution, which admits any woman of acceptable character descended from an ancestor who rendered material aid to the cause of inde-

pendence. (See DAUGHTERS OF THE AMERICAN REVOLUTION, SOCIETY OF.) Of similar nature is the Daughters of the Revolution (q.v.). Other societies are the Daughters of the Cincinnati, organized in New York City in 1894, and the Dames of the Revolution, organized in New York City in 1896. The Society of the Children of the American Revolution, with a membership of boys and girls too young to join the older societies, was organized in Washington in 1895. There was organized in 1897 a Society of the Descendants of the Signers of the Declaration of Independence, to which any person over 21 years of age who is lineally descended from a signer of that immortal document is eligible.

Of the period subsequent to the War of the Revolution and prior to the Civil War, there are comparatively few associations that are both patriotic and hereditary, although worthy of mention of that character is the St. Nicholas Society of New York, organized in New York City on Feb. 28, 1835. This society admits natives or residents of New York State who are descended from residents of the State prior to 1785. The War of 1812 is commemorated by the Veteran Corps of Artillery. (See WAR OF 1812, MILITARY SOCIETY OF THE, by which name it has been known since 1892.) The General Society of the War of 1812 admits to membership any male person who is lineally descended from a participant in the War of 1812. (See WAR OF 1812, GENERAL SOCIETY OF.) Corresponding to the last mentioned is the Society of the United States Daughters of 1812. (See UNITED STATES DAUGHTERS OF 1812.) The memory of the War of Mexico is preserved by the Aztec Club of 1847 (q.v.). The Association of Mexican Veterans admits to membership descendants of any participant who served in that war. Daughters of the Republic of Texas consists of lineal descendants of those who served in the military or civil service of the Republic of Texas prior to its annexation in 1845.

The Civil War proved rich in the formation of commemorative societies. One of the most important of these is the Military Order of the Loyal Legion, which admits to membership officers who participated in the war, and as a second class the eldest sons of living original members. (See LOYAL LEGION OF THE UNITED STATES, MILITARY ORDER OF.) The Grand Army of the Republic (q.v.), popularly known as the G. A. R., admits to membership any soldier or sailor who was honorably discharged after service. As the Grand Army grew in strength, there was organized as an auxiliary the Woman's Relief Corps (q.v.), which admits to membership mothers, wives, daughters, and sisters of Union soldiers. Also auxiliary to the Grand Army is the Sons of Veterans (q.v.). The Union Veteran Legion (see VETERAN LEGION, UNION) draws the line closer than the G. A. R., for it admits only those who volunteered prior to July 1, 1863, for a term of three years. That is to say, it will not admit any drafted person or substitute. It has as an auxiliary the Ladies of the Union Veteran Legion, which was organized in Newark, Ohio, on Feb. 20, 1890. The Union Veteran Union (see VETERAN UNION, UNION) admits veterans who served between April 12, 1861, and April 30, 1865, and who participated in one or more engagements or battles and received an honorable discharge. Of broader scope than the foregoing is the Army and Navy Union of the United States of America, in which

any honorably discharged soldier, sailor, or marine, without regard to time or length of his service, is eligible for membership. The Medal of Honor Legion (q.v.) is composed of officers and enlisted men who have received the medal of honor (q.v.) for distinguished conduct in action. There is also a Military Order of the Medal of Honor with similar membership and objects. The United States Veteran Navy (q.v.) admits to membership any officer or enlisted man in the naval service during the period of the Civil War or during the Spanish-American War. There is also the National Association of Naval Veterans, to which any officer or enlisted man who served in the navy or marine corps during the period of the Civil War is eligible. (See NAVAL VETERANS, NATIONAL ASSOCIATION OF.) Mention should also be made of the Society of the Army of the Cumberland, Society of the Army of the Potomac, and Society of the Army of Tennessee, as well as the Eleventh Army Corps Association, whose character is evident from their names. They now admit to membership descendants of original members, thus becoming hereditary societies.

The history of the Confederate States of America is preserved by three organizations, the oldest of which is the United Confederate Veterans, which admits to membership any soldier or sailor who served in the Confederate service during the Civil War. (See CONFEDERATE VETERANS, UNITED.) The United Sons of Confederate Veterans admits to membership any male descendants over 16 years old of a soldier or sailor who served in the Confederate army or navy. (See CONFEDERATE VETERANS, UNITED SONS OF.) The United Daughters of the Confederacy admits to membership the widows, wives, mothers, sisters, and lineal descendants of those who served in the army or navy of the Confederate States. See CONFEDERACY, UNITED DAUGHTERS OF THE.

The long period between the Civil War and the War with Spain saw the organization of two patriotic societies—the Order of the Indian Wars of the United States, founded at Chicago in 1896, and the Society of Veterans of Indian Wars of the United States, established at Philadelphia in the same year. The War with Spain (1898) was prolific in the formation of war societies. Corresponding to the Loyal Legion is the Naval and Military Order of the Spanish-American War, which admits to membership officers who were on the active list in the United States army, navy, marine corps, or revenue marine during the War with Spain or the subsequent insurrection in the Philippines. (See SPANISH-AMERICAN WAR, NAVAL AND MILITARY ORDER OF.) The most important organization of this period, however, is the United Spanish War Veterans (q.v.), which admits to membership soldiers and sailors of the regular and volunteer armies, navy, and marine corps who served honorably during the war. This society was organized in April, 1904, and was a consolidation of the National Army and Navy Spanish War Veterans, National Association of Spanish-American War Veterans, and the Society of the Service Men of the Spanish War, to which was added in 1906 the Legion of Spanish War Veterans and in 1908 the Veteran Army of the Philippines. The Society of the Army of Santiago de Cuba admits to membership all officers and soldiers of the United States army who served with the expeditionary force to Santiago de Cuba. (See

SANTIAGO DE CUBA, SOCIETY OF THE ARMY OF.) The occupation of Porto Rico gave rise to the Military and Naval Society of the Porto Rican Expedition. (See PORTO RICAN EXPEDITION, MILITARY AND NAVAL SOCIETY OF.) The members of the first regiment of United States Volunteer Cavalry that served in Cuba, before disbanding, organized the Rough Riders' Association. The Spanish-American War in the West Indies was also productive of the Society of the Caribbean, which was founded by American war correspondents who participated in the naval and military campaigns in Cuba and Porto Rico. Service in the Philippines led to the organization of the National Society of the Army of the Philippines. Membership is extended to soldiers and sailors who served during the war in the Philippine Islands. The Military Order of the Carabao was formed in the Philippines by officers who served in those islands during the fighting period, and any officer is eligible to membership who was there prior to July 4, 1902. Participants in the Chinese expedition for the relief of Peking, on their return to Manila, organized the Military Order of the Dragon.

The Mount Vernon Ladies' Association has for its special purpose the preservation of the home of Washington. Of similar nature is the Ladies' Hermitage Association, which cares for the home of Andrew Jackson, near Nashville, Tenn., and the Betsy Ross Memorial Association, which has saved the house in Philadelphia where the first American flag was made. The American Flag Association, organized in 1898, is a union of the flag committees of the patriotic societies of the United States and also of individual members. Its object is to preserve the American flag from desecration. The George Washington Memorial Association, which was incorporated in 1898, has for its purpose the erection of a George Washington Memorial building in the city of Washington. The Landmarks Club in Los Angeles is doing a splendid work in the restoration and preservation of the old missions which were left by the Spanish occupants of Alta California, and the beautiful missions near San Antonio are cared for by an organization of women in Texas. In Colorado the cliff dwellings of the Mancos Cañon were leased by the Colorado Cliff Dwellers' Association; through their efforts the permanent preservation of these ancient ruins has been secured. A national body has been formed known as the American Scenic and Historic Preservation Society, which is doing excellent work. (See SCENIC AND HISTORIC PRESERVATION SOCIETY, AMERICAN.) Consult S. A. Phillips, *The Patriotic Societies of the United States* (New York, 1914).

PATRIOTS' DAY. The anniversary celebrated in Maine and Massachusetts of the double battle of Concord and Lexington on April 19, 1775. It was first observed April 19, 1894.

PATRIPAS'SIANISM (from Lat. *patrius*, relating to a father, from *pater*, father + *passio*, suffering, from *pati*, to suffer, to endure). One variety of monarchianism, a belief held by many Christians in the West about 200 A.D., according to which Christ and God were so completely identified that the Father himself was said to have suffered and died on the cross. It seems to have originated in the East, but was brought to Rome by Praxeas, late in the second century, and a little later by Noëtus of Smyrna. Its most famous advocate was Sabel-

lius (q.v.), whose name is often used to designate this form of belief (Sabellianism). The origin of the position was a strong reaction from such distinctions between God and Christ as would make them seem to be two Gods. Tertullian and Hippolytus vigorously attacked the Patripasianists, or Modalists, as they are also called. Largely under the influence of Origen's teaching, the Church rejected modalism, and defined the Catholic doctrine of the Trinity so that it expressed personal distinctions in the Godhead. Consult: I. A. Dorner, *History of the Development of the Doctrine of the Person of Christ* (Edinburgh, 1861-63); W. Mackintosh, *Study of the Doctrine of Jesus* (Glasgow, 1894); G. P. Fisher, *History of Christian Doctrine* (New York, 1896); Adolf Harnack, *History of Dogma*, vol. ii (trans. from 3d Ger. ed. by Neil Buchanan, Boston, 1897). See ATHANASIUS; MONARCHIANS; NICÆA, COUNCILS OF.

PATRISTIC THEOLOGY. The name applied to the teachings of the early Christian writers who are collectively known as fathers (q.v.) of the Church. They are commonly divided as follows: 1. The apostolic fathers. These include Clement of Rome, Polycarp, Ignatius, Barnabas, Hermas, and Papias. 2. The ante-Nicene fathers of the second and third centuries, whose work is mainly of an apologetic nature, against Jews on the one hand and Gentiles on the other. Of these the principal names are Justin Martyr, Irenæus, Clement of Alexandria, and Origen in Greek, and Tertullian and Cyprian in Latin. 3. The Nicene fathers of the fourth century, who set forth the fully developed doctrines of the Trinity and the incarnation and defended them against heretics on both sides of the received teachings. They include Eusebius the historian, Athanasius, Gregory of Nazianzus, Gregory of Nyssa, Cyril of Jerusalem, John Chrysostom, and Epiphanius in Greek, Hilary of Poitiers, and Ambrose in Latin. 4. Classed as post-Nicene are, in the East, Cyril of Alexandria, Theodoret and John of Damascus; in the West, Jerome, Augustine, Leo the Great, and Gregory the Great. For extended treatment, see the articles under each of these names. There were three great theological movements during this period: (1) that represented by Clement and Origen, in which Greek philosophy was brought into connection with Christianity, especially in the development of the doctrine of the Logos (q.v.) as an explanation of the person of Christ; (2) that led by Athanasius, which issued in the definition of the person of Christ as expressed in the Nicene Creed (see CHRISTOLOGY); (3) that which discussed the problem of God's sovereignty and man's free will, forming the basis of the later theology of the Western church on the subjects of sin and redemption. This movement is best expressed by Augustine (q.v.). Consult Adolf Harnack, *History of Dogma* (trans. from 3d Ger. ed. by Neil Buchanan, 7 vols., Boston, 1897-1900), giving a full treatment of the theology of the period.

PATROCLUS (Lat., from Gk. Πάτροκλος, *Patroklos*). In Greek legend, a son of Menæceus and friend of Achilles (q.v.). According to the common story, while yet a boy in Opuntian Locris, he accidentally killed a playmate and in consequence was brought by his father to Peleus, father of Achilles, at Phthia. With Achilles he went to the Trojan War. Though

he was mentioned in the stories of the earlier years of the Trojan War, it is through the *Iliad* that his name has become familiar to us. At the crisis of the battle, when the victorious Trojans had begun to burn the Greek ships, Patroclus persuaded Achilles, who in anger had withdrawn from the fighting, to allow him to lead the Myrmidons to the rescue. At their head he drove the routed Trojans to their walls, but fell before Apollo and Hector. Over his body raged one of the fiercest struggles described in the poem, and it was only when the cry of Achilles struck panic among the Trojans that the Greeks were able to bear the body of Patroclus to the ships, where it was mourned in touching verses by Achilles. In later times Patroclus was worshiped as a hero on the Hellespont, where he was believed to be buried with Achilles, and at Opus in Locris.

PATROL' (from Fr. *patrouiller*, to patrol, dabble in the water, paw, OF. *patrouiller*, *patouiller*, *patoiller*, to paddle through water, from *patte*, *pate*, paw). Small detachments employed for a variety of purposes, the name of the detachment indicating its duty, as visiting, connecting, combat, exploring, reconnoitring, flanking, harassing, pursuing patrols, etc. *Visiting* patrols maintain communication between the parts of the outpost and supervise the performance of duty on the line of observation. (See **OUTPOST**.) *Connecting* patrols keep separated bodies of troops in touch with each other and are usually composed of cavalry. *Combat* patrols are usually disposed on the flanks to give warning and protect from a sudden surprise and attack. They are usually of sufficient strength to delay such an attack. *Exploring* patrols are usually required to furnish road sketches or maps. *Flanking* patrols are located, as their name indicates, with a view to securing information of the enemy's approach from the side. *Harassing* and *pursuing* patrols are combat patrols with the special missions indicated by their names.

Reconnoitring patrols are employed to gather military information for the use of commanders in the field charged with the duty of leading troops. Such patrols habitually seek safety in concealment or flight, fighting *only* when their mission demands it. The most skillful patrolling is where patrols accomplish their mission and return without being discovered by the enemy.

The commander determines the number and strength of patrols and when they are to be sent out. It is a cardinal principle to send out only such patrols as insure effective reconnaissance. Patrols vary in strength from two or three men to a company. Small patrols have great mobility, are easily concealed, and do not draw heavily on the fighting strength. In hostile territory, or when resistance is expected, stronger detachments are required. These cover themselves with small patrols of two to four men, the remainder acting as support. The officer sending out a patrol verifies the detail, designates a second in command, and gives the necessary instructions. Horses of conspicuous color and those that neigh when alone should not be sent. Precautions are taken to avoid the glitter and rattle of weapons and equipment.

The orders or instructions for a patrol, or for any detachment going on reconnaissance, must state clearly where the enemy is or is

supposed to be, what information is desired, what features are of special importance, the general direction to be followed, whether friendly patrols are liable to be encountered, and where messages are to be sent or the patrol is to report. Important and comprehensive instructions should be in writing, but precautions against capture of papers must be taken. An officer sending out a patrol must be certain his orders are understood. Detailed instructions are, as a rule, avoided. When necessary, the time of return is stated. Patrol leaders are selected with care, officers being detailed for important missions. They may often find themselves in positions where the situation must be viewed from the standpoint of a higher commander and should be able to reason accordingly. In the conduct of the patrol the greatest vigilance must be exercised to prevent discovery. For this reason no normal formation is or should be prescribed. Whatever the formation, it should favor the escape of at least one man to bring back the information. In questioning civilians care must be taken not to disclose information that may be of value to the enemy. Indications of the enemy should be at once reported to the patrol leader, and with all such indications every member of the patrol should be familiar by training and experience. A system of simple signals for use between the members of the patrol should be devised and practiced. The information most desired by a commander from his patrols is the number, character, and condition of the enemy, the direction in which he is marching, and whether the enemy troops discovered are the main body or the advance guard or outposts. To obtain this information requires a patrol leader possessing good health, vigorous physique, keen eyesight, presence of mind, and courage, with good judgment, military training, and experience. Consult Bond and McDonough, *Technique of Modern Tactics* (Menasha, Wis., 1913), and *Field Service Regulations of the United States Army*, 1914 (Washington, 1914).

PA'TRON (OF., Fr. *patron*, from Lat. *patronus*, protector, from *pater*, father). Among the Romans, originally the appellation of a citizen who had dependents, noncitizens, called clients, attached to him. Before the time of the Laws of the Twelve Tables the most frequent use of the term *patronus* was in opposition to *libertus*; the two words were used to signify persons who stood to one another in the relation of master and manumitted slave. The Roman was not deprived of all right in his slave when he freed him; a tie remained somewhat like that of parent and child, and the law recognized important obligations on the part of the *libertus* towards his patron, the neglect of which involved severe punishment. In some cases the patron could claim a right to the whole or to a part of the property of his freedman. The original idea of a patron apart from the manumitter of slaves continued to exist. A free Roman, a plebeian, whether citizen or not, desirous of a protector, might attach himself to a patron, whose client he thenceforward became; in this way he secured connection with a *gens*. Distinguished Romans were sometimes patrons of dependent states or cities, particularly where they had been the means of bringing them into subjection. Thus, the Marcelli were patrons of the Sicilians because Claudius Marcellus had conquered Syracuse and Sicily. The patron was

the guardian of his client's interests, public and private; as his legal adviser, he vindicated his rights before the courts of law. The client was bound on various occasions, if he was able, to assist the patron with money, as by paying the costs of his suits, contributing to the marriage portions of his daughters, and defraying in part the expenses incurred in the discharge of public functions. Patron and client were under an obligation never to accuse each other; violation of this law was tantamount to treason, and any one might slay the offender with impunity. This relationship between patron and client remained virtually unchanged down to 100 B.C. From that time on, especially after the establishment of the Empire under Augustus, the relation became more and more a purely formal one, till in the time of Juvenal and Martial the main duty of the client (who was often himself a person of consequence) was to attend his patron in public; in return he received a daily dole, the *sportula*, in food or in money. As the patron long was in the habit of appearing in support of his clients in courts of justice, the word *patronus* acquired in course of time the signification of advocate or legal adviser and defender, the client being the party defended; hence the modern relation between counsel and client. Patron in after times became a common designation of every protector or powerful promoter of the interests of another; and the saints, who were believed to watch over the interests of particular persons, places, trades, etc., acquired in the Middle Ages the designation of their patron saints. The saint in whose name a church is founded is considered its patron saint. For the earlier period, consult G. W. Botsford, *The Roman Assemblies* (New York, 1909).

PATRONAGE (Lat. *patronaticum*, homage due a patron, from Lat. *patronus*, protector), ECCLESIASTICAL. The right of presenting a properly qualified person to a vacant ecclesiastical position. Such a right is under many circumstances a species of property that may be enforced in the proper courts of law. The most important distinction is between lay and ecclesiastical patronage—the first exercised by laymen, the second by ecclesiastics holding some particular office. The patron originally was the person who founded or endowed the benefice, yet the title came to be applied also to one who succeeded to the right as property. Proprietors of lands were early encouraged to build and endow churches on their own possessions. In such cases the priest in charge did not look to the bishop for his support, but was allowed to receive the whole or a part of the profits of the lands with which the founder had endowed the church. In 655 the Council of Toledo granted to laymen the right to nominate a person in holy orders to be the incumbent of churches founded by them. The person enjoying the privileges of a founder was called *patronus* and *advocatus*. He had a prominent seat and a burial place in the church; his name and arms were engraved on the church and on the church walls, and he was specially named in the public prayers. He sometimes also had a right to a portion of the church funds, called *patronagium*.

In France the right of patronage was often extended by the sovereigns to churches not originally private foundations. Church property was bestowed in fee on laymen, who appropriated the greater part of the revenues and took the

appointment of the clergy into their own hands. It was at last ruled by the third and fourth Lateran councils (1179 and 1215) that the presentation of the patron should not of itself suffice to confer any ecclesiastical benefice when the presentee was a layman.

Towards the close of the twelfth century letters of request began to be issued by the popes to patrons that benefices should be bestowed upon particular persons. What had at first been requested as a favor was soon demanded as a right. In the thirteenth century the patronage of all livings whose incumbents had died at the court of Rome (*vacantia in curia*) was also claimed by the Pope. By the fourteenth century these claims encountered effective opposition. England took the lead in a resistance which was in the end successful. In Scotland, at the time of the Reformation, the rights of patrons were reserved, and the presbyteries were bound by several statutes to admit any qualified person presented by the patron. For three centuries the question of lay patronage was a cause of contention, legislation, and litigation, but by an Act of Parliament passed in 1874 patronage in Scotland was abolished and the right of choosing their minister transferred to the congregation. Upon the continent of Europe, in the Protestant churches of Germany, Denmark, Sweden, and Norway, ecclesiastical patronage exists to some extent. The only form of ecclesiastical patronage to be found in the United States is that in the hands of the bishops of the Roman Catholic church. With these rights the decrees of the plenary councils of Baltimore have dealt upon the general principles laid down by the canons of the third and fourth Lateran councils.

PA'TRONS OF HUSBANDRY. See GRANGE.

PATRONYMIC (Lat. *patronymicus*, from Gk. *πατρωνικός*, *patrōnomikos*, relating to one's father's name, from *πατήρ*, *patēr*, father + *ὄνομα*, *onoma*, name). Properly a name taken from one's father, but generally applied to such names as express descent from a parent or ancestor. In Sanskrit, Greek, and Latin patronymics are very numerous. They may be derived from the name of a father, mother, grandfather, or remoter ancestor, as Atrides, son of Atreus; Æacides, grandson of Æacus. The names of the founders of nations have also been used to form a sort of patronymic, as when the Romans were called Romulide. In Old and Middle High German the suffixes *ung* and *ing* were patronymics, as, e.g., in *Karolingen*, the descendants of Charles, and *Nibelungen*, the sons of Nibel. In Slavic the patronymic *Pavlovitch* is the "son of Paul," while the matronymic *Pavlovna* means the "daughter of Paul." The usual patronymic suffix in Anglo-Saxon was *-ing*. A number of the surnames in use in modern times are patronymics, as Johnson, the son of John. Originally these names fluctuated from generation to generation, as was the case in Shetland, where Magnus Johnson's son called himself John Magnusson or Manson. In the course of time it was generally found more convenient to take a surname from one well-known ancestor, which should descend unchanged to the children of the bearer of it. Consult Gubler, *Die Patronymica im Alt-Indischen* (Göttingen, 1903).

PATROON (Dutch *patroon*, protector, patron, from Lat. *patronus*, protector). The name applied to a special class of settlers in New

Netherland. In 1629, in order to encourage the emigration of farmers to America, the Dutch West India Company granted certain "freedoms and exemptions" to such of their number as within a period of four years after having given due notice should plant a colony of 50 persons over 15 years of age in New Netherland. Such men were to be called patroons (or patrons), and each was to have as his "absolute property" a tract of land extending 16 miles along any navigable river (or 8 miles if on each shore) and "so far into the country as the situation of the occupiers will permit." The proprietors were, besides, invested with many feudal privileges, being empowered to hold both civil and criminal courts, to appoint local officers and magistrates, and to punish offenders against the law, except in certain specified cases, where there existed a right of appeal to the Director General at Fort Amsterdam. In practice, however, this right was virtually abrogated. The settlers were to be exempt from taxes for 10 years, but were to be absolutely bound to their patroon for a specified period and were to pay certain rentals, either in money or in kind. Schools and churches were to be established, but at the same time slavery was introduced, commerce was restricted, and manufacturing was prohibited on pain of banishment. Several patroonships were soon established, the largest (and the first) being Rensselaerswyck, which remained in the Rensselaer family until about the middle of the nineteenth century. In 1640 a new charter of "freedoms and exemptions" was granted, by which patroonship privileges were extended to "all good inhabitants of the Netherlands," the period of settlement limited to three years, the prohibition of manufacturing rescinded, and the size of the grants limited to 4 miles along the coast or bank of a navigable river and 8 miles into the interior. At the same time many inducements were offered to smaller landholders, called masters or "colonists." The system gave New York one of its characteristic features throughout the Colonial period, creating as it did a landed aristocracy, fostering class divisions and semifederal relations between landholder and tenant, and discouraging the immigration of settlers, who naturally preferred to obtain land in fee simple in other Colonies rather than become tenants of proprietors in New York. Under the English régime the system remained unchanged, but in 1775 the patroons became mere proprietors of estates. Many characteristics of the old feudal tenure, however, remained, and the relations between tenant and landlord became more strained, until a modification was effected by the antirent agitation of 1839-47. Consult E. B. O'Callaghan, *History of New Netherland* (2 vols., New York, 1846), and D. S. Alexander, *Political History of the State of New York* (3 vols., ib., 1906-09). See ANTIRENTISM.

PATTAN, pá-tán'. A town of India. See PATAN.

PATTE, pá'tá' (OF. *patte*, broad-footed, from *patte*, paw). A term in heraldry (q.v.) applied to a cross with its arms expanding towards the ends and flat at their outer edges.

PATTEN, JAMES A. (1852-). An American financier and grain merchant, born at Freeland Corners, Ill. He attended the common schools and was early a clerk, a farmer, and (1874-78) employed in the State department of grain inspection, where he learned the

details and operation of the grain commission business. Between 1878 and 1910 he was a member of several firms, from 1880 to 1903 being associated with his brother. Patten was Republican mayor of Evanston in 1901-05. He was prominently before the public in connection with an attempt to corner the wheat crop in 1909. It was alleged that Patten himself secured control of more than 23,000,000 bushels of wheat, and that these holdings, together with those of his associates, were sufficient to force the price of wheat and flour up, while he gained enormous profits. The result was a charge against him of manipulation and indignant censure throughout the country and abroad. Patten also operated his business in Liverpool, where in 1911 his appearance provoked a riot.

PATTEN, SIMON NELSON (1852-). An American economist, born at Sandwich, Ill. He was educated at Jennings's Seminary (Ill.), Northwestern University (Ill.), and at the University of Halle, Germany, and received the degree of Ph.D. in 1878. During the next 10 years he taught in the public schools of Iowa and Illinois. In 1888 he was elected professor of political economy at the University of Pennsylvania. In 1908-09 he served as president of the American Economic Association. His principal works are: *Premises of Political Economy* (1885); *The Consumption of Wealth* (1889); *Malthus and Ricardo* (1889); *The Stability of Prices* (1889); *The Economic Basis of Protection* (1890); *The Principles of Rational Taxation* (1890); *The Theory of Dynamic Economics* (1893); *The Place of University Extension* (1894); *The Theory of Social Forces* (1896); *Development of English Thought* (1899); *The Theory of Prosperity* (1901); *Heredity and Social Progress* (1903); *The New Basis of Civilization* (1907); *Product and Climax* (1909); *The Social Basis of Religion* (1911); *The Reconstruction of Economic Theory* (1912). Professor Patten ranks as one of the most brilliant and original of American economic writers. His chief contributions to economics were his analyses of dynamic forces in economic life, of monopoly elements in value, and of the bearing of the laws of consumption upon distribution. A large part of his work is in the field of sociology.

PATTEN, WILLIAM (1861-). An American zoölogist, born at Watertown, Mass. He graduated from Harvard University in 1883 and received the Ph.D. degree at Leipzig in 1884. Patten was assistant in the Lake Laboratory at Milwaukee, Wis., from 1886 to 1889, professor of biology in the University of North Dakota from 1889 to 1893, and thereafter professor of zoölogy at Dartmouth College. He published *The Evolution of Vertebrates and their Kin* (1912) and numerous articles on invertebrate anatomy and embryology in zoölogical journals.

PATTERSON. A town in St. Mary Parish, La., 87 miles by rail southwest of New Orleans, on the Atchafalaya River and on the Southern Pacific Railroad (Map: Louisiana, G 7). It contains a fine high-school building and St. Mary's Hospital. The surrounding country is adapted to lumbering and the growing of sugar cane. The water works are owned by the town. Pop., 1910, 2998.

PATTERSON, CARLILE POLLOCK (1816-81). An American civil engineer, superintendent of the United States Coast Survey, born at Shields-

boro, Miss. He was appointed midshipman in 1830, served in the Mediterranean squadron, and, after graduation at Georgetown College as a civil engineer in 1838, was attached to the Coast Survey (1838-41). In 1845 he led a hydrographic expedition to the Gulf of Mexico, from 1850 to 1861 commanded the Pacific mail steamer *Oregon*, in 1861 was appointed hydrographic inspector in the United States Coast Survey and in 1874 superintendent. This department was greatly developed by him.

PATTERSON, DANIEL TOD (1786-1839). An American naval officer, born on Long Island, N. Y. He entered the navy in 1800 and was on board the frigate *Philadelphia* in the expedition commanded by Capt. William Bainbridge when the frigate ran upon the rocks off the coast of Tripoli, and the entire crew were held prisoners until peace was declared. In 1813 he was promoted to be commander. In September, 1814, he commanded the expedition which broke up the establishment of the pirate Jean Lafitte (q.v.) in Barataria Bay. He was made captain in 1815, commanded the frigate *Constitution* from 1826 to 1828, and in the latter year was appointed navy commissioner. In 1832-36 he commanded the Mediterranean squadron and on his return was appointed commander at the navy yard at Washington, where he remained until his death.

PATTERSON (BONAPARTE), ELIZABETH (1785-1879). An American woman, famous as the wife of Jerome Bonaparte. She was born in Baltimore, Md., and was the daughter of William Patterson, one of the wealthiest men in the United States. When Jerome Bonaparte visited Baltimore in 1803, he fell in love with Miss Patterson, and the two were married by Bishop Carroll, Dec. 24, 1803. In April, 1804, Napoleon, through M. Pichon, Consul General of France in New York, declared the marriage illegal and ordered Jerome to return to France and to leave the "young person" behind. The other members of his family, however, accepted the situation and promised to receive her. In 1805 Jerome and his wife sailed for Europe. The latter, not being allowed to land either at Lisbon or Amsterdam, went to England, and her son, Jerome Napoleon, was born at Camberwell, July 7, 1805. Meanwhile Napoleon had requested unsuccessfully the annulment of the marriage from Pope Pius VII, but the Council of State granted the divorce. In November Madame Bonaparte returned to the United States and lived with her father. After the battle of Waterloo she went to Europe, where she was well received in the most exclusive circles and was much admired for her beauty and wit. In 1815, by special Act of the Legislature of Maryland, she secured a divorce. From 1816 to 1819 she was in Baltimore and subsequently spent much of her time in Europe. Her last years were spent in Baltimore in the management of her estate, whose value she increased to \$1,500,000. Consult F. B. Goodrich, *The Court of Napoleon III* (Philadelphia, 1864), and E. L. Didier, *Life and Letters of Madame Bonaparte* (New York, 1879).

PATTERSON, JAMES COLEBROOKE (1839-). A Canadian lawyer and statesman. He was born at Armagh, Ireland, and was educated in Dublin. Going to Canada in 1857, he first engaged in teaching, but later studied law and was called to the bar in 1876. Removing to Windsor, Ontario, he served as a Conservative

member of the Ontario Legislature (1874-78) and later of the House of Commons (1878-95). During 1891-95, in the brief Conservative Ministries after the death of Sir John A. Macdonald, Patterson was, first, Secretary of State and afterward Minister of Militia and Defense. He was Lieutenant Governor of Manitoba and Keewatin in 1895-1900.

PATTERSON, ROBERT (1743-1824). An American educator and director of the mint. He was born near Hillsborough, County Down, Ireland, emigrated to the United States in 1768, and lived for a time in Philadelphia. In 1774 he became principal of an academy in Wilmington, Del. In the disputes between the Colonies and the British ministry he allied himself with the Whig or Patriot party, and in the early part of the Revolutionary War served as assistant surgeon and brigadier major in the Continental army. From 1779 to 1814 he was professor of mathematics in the University of Pennsylvania, being also from 1810 to 1813 vice provost. In 1805 President Jefferson appointed him director of the mint, which position he held until a short time before his death. Always actively interested in the American Philosophical Society, he was its president from 1819 until his death. He published *The Newtonian System* (1808) and edited various works on mathematics and physics.

PATTERSON, ROBERT (1753-1827). An American pioneer, born in Pennsylvania. He emigrated to Kentucky in 1775. In October, 1776, on a trip to Fort Pitt to secure ammunition, his party was attacked by Indians, and every member was killed or wounded. He took part in Col. George R. Clark's successful expedition against Kaskaskia and Vincennes in 1778 and in Capt. John Bowman's attack on Chillicothe in 1779. In April, 1779, he built a blockhouse on the present site of Lexington, Ky. In 1780 he was a captain in Colonel Clark's expedition against the Shawnees and in 1782 was second in command under Daniel Boone at the lower Blue Lick. He was a colonel in Clark's second expedition into the Miami country this year and served with Gen. Benjamin Logan's expedition against the Shawnees in 1786, in which he was severely wounded. He, with two companions, bought from John Cleves Symmes a tract of 740 acres of land opposite the mouth of the Licking River and founded in 1788 the town of Losantiville, now Cincinnati. He sold his interest in 1794 and in 1804 settled in Dayton, Ohio, where he lived until his death.

PATTERSON, ROBERT (1792-1881). An American soldier, born at Cappagh, County Tyrone, Ireland. About 1798 he came with his parents to the United States and finally settled in Philadelphia. During the War of 1812 he was assistant deputy quartermaster general with rank of captain from 1813 to 1814 and in 1814 was appointed captain of the Thirty-second Infantry. He was commissioned major general of volunteers in 1846 and in the Mexican War commanded a division at Cerro Gordo, directed the pursuit of the retreating Mexicans by the cavalry and leading infantry brigades, and occupied Jalapa. Under President Lincoln's three-months call for troops (April 15, 1861) he was appointed by Governor Curtin, of Pennsylvania, major general of volunteers, organized the three-months forces in Philadelphia, and later commanded the Department of Pennsylvania. When McDowell began his march against Beauregard,

Patterson was instructed to detain Johnston and prevent him from supplying Beauregard with reinforcements. This, however, he failed to accomplish. He withdrew to Charleston, about 18 miles from Winchester, and Johnston's entire force arrived in time to take part in and determine the result of the first battle of Bull Run. A long controversy ensued as to the responsibility for this event, and Patterson was vigorously criticized in some quarters. He published a vindication entitled *A Narrative of the Campaign in the Valley of the Shenandoah in 1861* (1865). Patterson was mustered out on July 27, 1861. He invested largely in the sugar and cotton industries and was among the leading American mill owners.

PATTERSON, ROBERT WILSON (1850-1910). An American newspaper editor and publisher. He was born in Chicago, graduated from Williams College in 1871, and then began the study of law. After the great fire in Chicago he became a reporter on the *Times*, later joined the staff of the *Interior*, and in 1873 became connected with the *Chicago Tribune*, of which he was successively assistant night editor, Washington correspondent, editorial writer, managing editor, and editor in chief. He was also president of the Chicago Tribune Company.

PATTESON, JOHN COLERIDGE (1827-71). An English missionary, Bishop of Melanesia. He was born in London, was educated at Ottery St. Mary, at Eton, and at Balliol College, Oxford. He obtained a fellowship at Merton, went to Dresden to study German, and was ordained in 1853 to the curacy of Alfrington, near Ottery St. Mary. In 1855, having been influenced by Bishop George Augustus Selwyn (q.v.), he left England with the Bishop to enter upon a missionary career. His first work was instructing boys of the Melanesian Islands, and when the mission was regularly established there he was, in 1861, consecrated Bishop, and fixed his residence at Mota. He spoke as many as 23 of the native dialects and made translations of parts of the Bible into the Mota tongue, which he regarded as typical. He made great improvements in the material and spiritual condition of the natives. His position was rendered difficult by the action of British traders who sometimes used his name to further the kidnapping of natives to be either enslaved or held as laborers upon the plantations of Fiji and Queensland. In mistaken revenge for such an outrage against the islanders of Nakapu, the Bishop himself was slain by the natives. Consult his *Life* by C. M. Yonge (London, 1878), also Frances Awdry, *The Story of a Fellow Soldier* (ib., 1875).

PATTI, pat'té. A town in the Province of Messina, Sicily, situated on the north coast, 35 miles west by south of Messina by rail (Map: Italy, E 5). Its cathedral contains the tomb of Adelasia, mother of King Roger II of Sicily. The town has silk mills, potteries, sandstone quarries, and a shipping trade in olive oil, flour, and fish. Pop. (commune), 1901, 11,082; 1911, 10,535.

PATTI, ADELINA (1843-). An operatic singer of Italian parentage, born in Madrid, Spain. When about 10 years of age, she appeared in a series of concerts with Ole Bull and Maurice Strakosch. After a course of professional study she made her first operatic appearance (1859) in New York. Her real début, which occurred in London, took place in 1861,

when she appeared as Amina in *La Sonnambula*, after which she was acknowledged one of the greatest artists of her day. Her voice was an unusually high soprano, of rich, bell-like quality and remarkable evenness of tone; to these qualities she added purity of style and high artistic finish. She was as popular throughout continental Europe as in England and America. Patti was married first (1868) to the Marquis de Caux (divorced, 1885); in 1886 to Ernesto Nicolini, a well-known tenor (died, 1898); and in 1899 to Baron Cederström, a Swedish nobleman. She made her residence in Wales, being owner of a magnificent castle. After about 1890 she confined herself almost entirely to the concert platform. Carlotta Patti was her sister.

PATTI (DE MUNCK) CARLOTTA (1840-89). An Italian singer, sister of Adelina Patti. She was born in Florence, of musical parents, who were also her first teachers in singing. She afterward studied the piano under Henri Herz at Paris. Her voice was a soprano of unusual compass and of a clear silvery quality, and much power in the upper register; a slight degree of lameness, however, prevented her from appearing in opera. Her peculiarly sweet high notes brought her into favor with the public. She made her début in New York in 1861, where for some years previously she had made her home. She became very popular throughout America as a concert soprano and was almost as successful in Europe, her first appearance there occurring in 1863 in London. Like her sister, she was a brilliant coloratura vocalist. She married De Munck, a violoncellist, in 1879. She died in Paris.

PATTISON, ANDREW SETH PRINGLE. See PRINGLE-PATTISON, A. S.

PATTISON, DOROTHY WYNDLOW (1832-78), better known as **SISTER DORA**. A famous nurse, sister of Mark Pattison (q.v.). She was born at Haukwell, near Richmond, Yorkshire. In 1864 she joined a sisterhood of the Church of England (the Sisterhood of the Good Samaritan) and early in the following year became a nurse in a cottage hospital at Walsall. In 1867 a new hospital was built, of which she had sole charge until 1877, when she resigned to become head of the municipal hospital in the same place. She had many natural gifts for her work, acquired much skill in surgery, and was tireless in philanthropic labors. Consult her life by Margaret Lonsdale (London, 1880), and Ellen Ridsdale, *Sister Dora; Personal Reminiscences of her Later Years* (ib., 1880).

PATTISON, JAMES WILLIAM (1844-1915). An American figure, landscape, and marine painter, also an author. He was born in Boston and studied under J. M. Hart and George Inness in New York, under Flamm in Düsseldorf, and under Luigi Chialiva in Paris. His paintings were exhibited in the Paris Salon and in various American cities. Among them is "Tranquillity" in the Art Institute, Chicago, where Pattison was faculty lecturer from 1896. He edited the *Fine Arts Journal*, Chicago, from 1910, contributed numerous articles on art to periodicals and newspapers, and is the author of *Painting in the Seventeenth and Eighteenth Centuries* (1901) and *Painters since Leonardo* (1904), both brief and popularly written treatises.

PATTISON, MARK (1813-84). An English scholar and writer, born at Haukwell, Yorkshire. He was educated at Oriel College, Oxford (B.A., 1836; M.A., 1840). He translated

the "St. Matthew" from Thomas Aquinas' *Opuscula Aurea on the Gospels* for Newman (written, 1839; printed, 1842) and also contributed biographies of Stephen Langton and St. Edmund to the series of lives of English saints published under Newman's editorship. In 1839 he was elected fellow of Lincoln and in 1843 was ordained priest. He was appointed to a tutorship of Lincoln in 1843 and in 1848 became examiner in the school of *literæ humaniores*. In 1853 he was again appointed examiner and in 1855 resigned his tutorship. He was then for a time a private tutor at Oxford, but later was much in Germany. In 1861 he was elected rector of Lincoln. He also became a curator of the Bodleian Library and of the Taylor Institution. From 1845 his theological views greatly changed; he separated gradually from the High Church party; he wrote for the *Essays and Reviews* (1860) an article on "Tendencies of Religious Thought in England, 1688-1750," intended as "a neutral and philosophic inquiry," and so recognized on the Continent, but not in England, and he remained a liberal member of the Anglican communion. He is one of those English clergymen who contrived to reconcile for himself rationalism and the Anglican profession of faith. His principal studies, however, were not theological or philosophical, but were directed originally to the preparation of a history of learning. Of this work only fragments were executed, most important of which is the *Life of Isaac Casaubon* (1875, 2d ed., 1892). Other portions appear in the selected *Essays* (2 vols., 1889), edited by H. Nettleship. He also wrote an excellent *Life of John Milton* (1879, reprinted, with alterations, 1880, 1883, 1885, 1887) for the "English Men of Letters Series," and edited Pope's *Essay on Man* (1869; 2d ed., 1872) and *Satires and Epistles* (1872, 2d ed., 1874). An edition by him of the *Sonnets* of Milton, with a valuable introduction, appeared in 1883. Other published volumes are *Sermons* (1885) and the *Memoirs* (to 1860), dictated in 1883 and printed in 1885. Pattison's literary work is for the main part marked by the most thorough scholarship, eminent judgment, and a skillful presentation of material. In real academic distinction he was second to none at Oxford. He was a tireless pedestrian and angler, a student of natural history, brief and often ironic in speech, contemptuous of sham, and so reluctant in the expression of his views as sometimes quite to hamper the proceedings of committees of which he was a member. Consult, besides the *Memoirs* mentioned above, John Morley, in *Critical Miscellanies*, vol. iii (London, 1892).

PATTISON, ROBERT EVERETT (1800-74). An American Baptist clergyman and educator. He was born at Benson, Vt., and was educated at Amherst College. In 1829 he was ordained to the ministry. From 1836 to 1839 he served as president of Waterville (now Colby) College in Maine, from 1843 to 1846 as corresponding secretary of the Baptist Board of Foreign Missions, and then for two years as president of the Western Baptist Theological Institute at Covington, Ky. Again in 1853-58 he presided over Waterville College. Subsequently Dr. Pattison held chairs of theology or philosophy in Newton Theological Institution, the Baptist Theological Seminary, Chicago, and the University of Chicago, where he was also vice president. In 1850 he published a *Commentary on the Epistle to the Ephesians*.

PATTON. A borough in Cambria Co., Pa., 20 miles northwest of Altoona, on the Pennsylvania and the New York Central railroads (Map: Pennsylvania, D 6). The borough is engaged chiefly in agriculture and in the manufacture of clay products. Pop., 1900, 2651; 1910, 3907.

PATTON, FRANCIS LANDEX (1843-). An American Presbyterian clergyman and educator. He was born in Warwick Parish, Bermuda. He studied at Knox College, Toronto, at the University of Toronto, and at Princeton Theological Seminary (New Jersey). Ordained to the ministry in 1865, he held several pastorates and in 1871 was appointed professor of didactic and polemical theology in the Theological Seminary of the Northwest (now McCormick Seminary, Chicago). There he remained for 10 years. During the period from 1873 to 1876 he edited the religious journal the *Interior* (Chicago), in which connection he brought charges of heresy against Prof. David Swing, resulting in the latter's trial and subsequent withdrawal from the church. While in Chicago, he also held the pastorate of the Jefferson Park Presbyterian Church, and in 1878 was elected moderator of the Presbyterian General Assembly. In 1881 he assumed the professorship endowed for him in Princeton Theological Seminary, styled the chair of the relations of philosophy and science to the Christian religion, this he continued to hold until 1888, when he succeeded James McCosh as president of Princeton College. Two years earlier he had become professor of ethics in the college, a chair he occupied until 1913, 11 years after he had resigned as president. From this date (1902) till 1913 he served as president of the seminary. In 1891 and 1892 he was again prominently before the public in a "heresy" trial, as a critic of the views of Dr. C. A. Briggs (q.v.) of Union Theological Seminary. Dr. Patton's administration of Princeton was marked by the official assumption (1896) of the title Princeton University (q.v.) in place of the charter name, The College of New Jersey (long out of use), and by large donations which enabled the university to make extensive additions to its equipment and buildings. The number of students nearly doubled during this period from 1888 to 1902, and new courses were added to both the scientific and academic departments. Perhaps most important in the future development of Princeton as a university was the founding of a graduate school. President Patton became widely known as a convincing speaker and as a keen, logical thinker on theological subjects. After his retirement he made his home at Warwick, Bermuda. He contributed frequently to leading periodicals and wrote *Inspiration of the Scriptures* (1869) and *Summary of Christian Doctrine* (1874).

PATUN. See JUANG.

PATUXENT. A river of Maryland, rising in Frederick County and flowing southeastward into Chesapeake Bay north of the Potomac (Map: Maryland, F 2). It is 90 miles long, and for the last 40 miles it is a navigable tidal estuary abounding in valuable oyster beds.

PATWIN, pà-twén'. See WINTUN.

PÁTZCUARO, pás'kwá-rō. A town of Mexico in the State of Michoacán, situated on the south shore of Lake Pátzcuaro, 38 miles southwest of Morelia (Map: Mexico, H 8). It is irregularly built, with narrow, crooked streets,

but is very picturesque in appearance, being surmounted by a church built on the top of a high hill. It is noted for the manufacture of fine furniture and beautiful featherwork. Pop., 1900, 7621; 1910, 5433. Patzcuaro is supposed to have been the Tarasca Indians' ancient capital.

PATZUM, pát-soom'. A town of the Department of Chimaltenango, Guatemala, 33 miles west of the city of that name (Map: Central America, B 3). The chief industry is wool weaving, and in the vicinity coffee, sugar cane, grain, and cotton are produced in abundance. Mines of silver, antimony, lead, and coal are found near by. Pop. (est.), 6964.

PAU, pò. The capital of the Department of Basses-Pyrénées, France, on the Gave de Pau, 105 miles south of Bordeaux (Map: France, S., D 5). It occupies a rocky height, cloven in two by a ravine and united by a high bridge. Towards the south unfold magnificent views of the western Pyrenees. Among its chief buildings are the two Gothic churches of St. Martin and St. Jacques, a palace of justice, a beautiful theatre, a museum, a public library containing 75,000 volumes, and a winter palace built in 1896 in Beaumont Park. The château of Henry IV, erected in the fourteenth century on the site of an older castle, dominates the town and contains sculptures, tapestries, and other memorials of the kings of Navarre. A striking marble statue of Henry IV stands on the Place Royale in the centre of the town. There are linen, cloth, and leather manufactures and a trade in Jurançon wine, grain, marble, and leather. Many swine are fed in the vicinity, and from the pork the famous *jambons de Bayonne* are made. Pau is a favorite resort for those who wish to explore the Pyrenees. Pop., 1901, 34,268; 1911, 37,149. Founded in the tenth century, Pau became important as the residence of the sovereigns of Navarre in the fifteenth century.

PAU, PAUL (1848-). A French general, born at Montélimar. He graduated from the Military Academy of Saint-Cyr in 1867. When the Franco-Prussian War broke out in 1870, he was a lieutenant of infantry, stationed at Châlons. On August 6 of that year, at Woerth, his right wrist was shattered so that the arm had to be amputated. Three months later he was promoted to captain, in 1871 had to spend some time in a hospital at Besançon, then returned to the front, and was decorated with the cross of the Legion of Honor. After Pau became brigadier general in 1897, he was given command of the forces at Montpellier. Highly popular as well as distinguished, at the opening of the European War in the summer of 1914, he was given important commands in Alsace. In 1915 he was sent on a diplomatic mission to Russia, the Balkan states, and Italy. With Joffre, the generalissimo, Foch, and Gallieni, Pau is to be ranked as one of the great French military figures of his day. He declined the post of Chief of the General Staff before it was offered to Joffre (1911). In contrast to the latter Pau became known as a strong clerical. See WAR IN EUROPE.

PAUER, pou'ér, ERNST (1826-1905). An Austrian-English pianist and writer on music, born at Vienna. He studied there with Dirzka, Sechter, and the son of Mozart, and at Munich with Lachner. He directed musical societies in Mainz from 1847 until 1851, when he went to London, but did not sever his conti-

mental connections and gave concerts in Germany and elsewhere. He became a professor at the London Royal Academy of Music in 1859 and was made Austrian court pianist in 1866. In 1867 he was made principal professor in the National Training School and from 1883 to 1896 held a similar position at the Royal College of Music. He was appointed musical examiner at Cambridge in 1879. From 1870 he gave musical lectures throughout Great Britain upon the history of music and kindred subjects, with pianoforte illustrations. In 1896 he retired to his villa at Jugenheim, near Darmstadt, where he died. He fathered German music in London, and to the Augener editions he contributed *Old English Composers for the Virginal and Harpsichord* as well as the Bach, Handel, Schumann, and other classical and romantic selections. Some of his own studies are included in the series of 100 called *The New Gradus ad Parnassum*, which he published. His compositions include, besides three operas, a symphony, quartet, quintet, songs, and pianoforte solos. He was the father of Max Pauer.

PAUER, MAX (1866-). An English pianist and teacher. He was born in London, studied under his father, Ernst Pauer (qv.), until 1881, and under V. Lachner at Karlsruhe until 1885, and thereafter appeared in concerts in London and on the Continent. In 1887-97 he was also professor of pianoforte at the Cologne Conservatory and afterward taught at the Stuttgart Conservatory, being chosen its director in 1908. In 1893 he was appointed chamber musician to the Grand Duke of Hesse. His first American season of 1913 proved a series of triumphs. He appeared in numerous recitals and with almost all the great symphony orchestras. The possessor of a rare combination of the poetic and intellectual qualities, he rendered works of widely different styles in a manner above criticism.

PAUL. The apostle of Jesus Christ who was specially commissioned to work among the Gentiles. The sources from which we secure our knowledge of his life and work are his own Epistles and the Book of Acts. From these it is clear that the condition of the Church when he came to the full prosecution of his work was one which rendered that work not only most significant for the future development of the Church, but most revolutionary to the ideas which the Church's leaders entertained as to what that development should be. These leaders were the Apostles who had formed the nucleus of Jesus' discipleship during his ministry on earth. They were men of limited education and with no great breadth of religious ideas. As a consequence their views of the necessary development of Jesus' religion practically restricted it to a reforming of Judaism in accordance with Jesus' teaching, and, as this reformed Judaism went out in a new evangelism to the world, it involved the bringing of the world into this religion through the gateway of Judaism. In view of their Palestinian training and experience these views were perfectly natural for the Apostles to entertain, but they were also clearly impossible for the Church to carry out if the religion of Jesus was to realize for itself that world-wide development which the Gospels show us Jesus himself intended it should have. It was at this latter point that Paul through his work and teaching introduced into the Church new conceptions which virtu-

ally revolutionized its ideas and made possible for Christianity its development as a universal religion.

Paul's original name was Saul; he was a native of Tarsus, an important city of considerable culture and refinement, in the Province of Cilicia (Acts xxi. 39), where he was born of Jewish parents about the beginning of the Christian era (Acts xxiii. 6; 2 Cor. xi. 22). His primary education was received probably in the synagogue school at Tarsus, where he lived until he had learned his trade of tentmaker (Acts xviii. 3). But while still quite young, perhaps not more than 15 years of age, he was sent to Jerusalem to be educated in the Rabbinic schools of that city, having as his teacher in the sacred Law the liberal-minded Gamaliel (Acts xxii. 3; see GAMALIEL). According to his own testimony he threw his whole heart into all that was taught him there, becoming one of the strictest members of the sect of the Pharisees and having no conception of salvation beyond that to be obtained through a perfect performance of the works of the Law (Gal. i. 14; Acts xxii. 3, xxvi. 4-5; Phil. iii. 4-6).

In time he became one of the more important of the younger Rabbinic students in Jerusalem, although it is not likely that he was actually a member of the Sanhedrin (Acts xxvi. 10 does not necessarily imply this). Whether he ever saw Jesus, or, in particular, was present at his trial and crucifixion, must remain uncertain. Apparently he was not seriously concerned with the new sect called Nazarenes until the preaching of Stephen showed that it was in reality a new system of belief and likely to become hostile to the existing Jewish system. Into the persecution which this produced he threw himself with energy, participating actively in the death of Stephen (Acts vii. 58; viii. 1) and following up this assault with a rigor of inquisition that made him notorious among the persecutors of the infant Church (Acts xxii. 4, xxvi. 9-11; Gal. i. 13-14). In the year 34 or 35, however, while nearing Damascus on a journey undertaken for the purpose of searching out the disciples in that place and bringing them bound to Jerusalem, he went through the experience of a supernatural vision that brought him to a deep conviction of the sinfulness of the course he was pursuing (Acts ix. 1-9). Out of this state of soul he became a Christian disciple, profoundly convinced of the Messiahship of Jesus and distinctly conscious of having received from his Master a commission to preach his religion among the nations of the earth (Acts ix. 10-18; Gal. i. 15-16).

This mission, however, he did not immediately carry out, but for the greater part of three years was in retirement in Arabia (Gal. i. 17). The purpose of this withdrawal it may not be possible definitely to determine, though, from the contrast in which he places it to the alternative course of conference with the Apostles at Jerusalem, it would seem that primarily it was for the sake of meditative thought upon the spiritual revolution which had taken place in his life. In fact, the acceptance of the crucified Jesus as the Messiah necessitated a complete recasting on Paul's part of his whole system of theology. At the same time it cannot be doubted that he availed himself of such opportunity of practical work as the region afforded (Gal. i. 15-23).

Upon his return to Damascus and Jerusalem he began to preach his new-found faith, evidently with some fuller conception of the Gentile direction of his mission than he had had immediately after his conversion (Act ix. 19-22), especially in Jerusalem, where he singled out the Greek-speaking Jews, disputing with them, doubtless largely along the lines of the Messiahship of Jesus (Acts ix. 28-29; xxii. 18). His chief motive, however, in going back to Jerusalem at this time was to visit the Apostle Peter, doubtless to learn from the lips of Jesus' foremost disciple the chief facts of Jesus' ministry and his main teachings (Gal. i. 18 f.). The bitter hostility of the Jews, who now looked upon Paul as a traitor, made it impossible for him to remain longer or carry on an active ministry in Jerusalem. In consequence of a vision to this effect he left the city and gave himself to work among the more distant Gentiles (Acts xxii. 17-20).

All that we know of Paul's next move is given in his own brief statement, "afterwards I came into the regions of Syria and Cilicia" (Gal. i. 21). After some time he found himself back in his native Tarsus, whence he was summoned by his old friend Barnabas to give his aid and assistance in the development of the new effort to evangelize the Gentiles which had recently shown itself in Antioch, the populous capital of Syria (Acts xi. 21-28).

Antioch now became the place of Paul's labors, and here his conspicuous abilities and zeal soon gave him a place among the leaders of the rapidly growing church of Antioch. Approximately 10 years had now passed since his conversion, during which time Paul had had ample time to mature and test his fundamental theological views. He was now sure of his position, and it was probably due to him more than to any other human agency that the first distinctive mission to the Gentiles was undertaken (Acts xiii. 1-3). The remarkable success of this mission (47-49 A.D.) brought Paul at last to a consciousness of the full meaning of his Gentile commission (Acts xiii. 44-48) and also brought the Church to a full realization of the significance of this new departure. In fact, upon their return to Antioch, Paul and Barnabas were confronted with a grave and serious problem. Parties representing the extreme Jewish element in the mother church came to Antioch insisting upon the need of circumcision in order to salvation. This was so contrary to Paul's fundamental conception of salvation by faith that surrender was impossible, and under the advice of the local church the controversy was carried up to Jerusalem for submission to the Apostles and Elders there (Acts xv. 1-2). A clear understanding of the resultant council and the position in it of Paul and Barnabas on the one side, and the leaders of the Church on the other, can only be secured by recognizing the development through which Paul's work had gone from his own original conception of it, and especially from the original conception of it held by the Jerusalem church. That Paul had the fundamentals of his theology from the time of his conversion may be accepted, as far as our records give any light; that these fundamentals included a clear conviction of the principles of justification by faith is almost necessary, if Paul's theology is to be understood as in any sense self-consistent—for this principle is practically essential to his

thinking. But while Paul may have possessed the principle of his theology from the beginning, it is manifestly clear that the practical experiences of his work had an effect upon the application which he gave to these principles. Few greater experiences, however, did he go through in his work than that of the wholesale conversion of the Gentiles during his first mission tour. These experiences must have given the decisive seal to his conviction of justification by faith and also must have widely broadened the application of that principle in the direction of the universalizing of the gospel beyond the bounds of Judaism. If, however, such was the influence of this experience upon Paul's own views, its effect upon the slower and more conservative views of the Jerusalem church must have been even more significant. Treasuring as they did the Jewish origin of Jesus' religion and the Jewish character of his discipleship, this wholesale ingathering of the uncircumcised Gentiles naturally seemed to them to herald the doom of the Church.

From such a situation it was inevitable that there should come dispute and controversy. The extremists on the side of the Jerusalem church insisted on circumcision—the distinctive feature of ceremonial Judaism—as necessary to salvation and acceptance within the Church. Paul and his followers insisted on the freedom from this rite given by the essential principle of justification by faith. It was the determination of this contention, in the light of the practical results of the first mission tour, that constituted the real question before the Jerusalem Council; and the decision which was reached to grant the Gentiles, with a few unessential provisos, full freedom from the ceremonial law was a result which was not only a triumph for the views of Paul, but the salvation of the Church itself. For, in spite of the conviction of the Jerusalem leaders, the Church's future lay beyond Judaism and could be reached only as the way to Christ was no longer obstructed by the forms which Judaism imposed. It was his profound conviction of the importance and vital character of the issue at stake that moved Paul to write so earnestly of the controversy in his Epistle to the Galatians (ii. 1-10).

From this council Paul and Barnabas returned to Antioch, and soon afterward (in 49 A.D.) Paul, having disagreed with Barnabas on some matters of their practical work, took with him Silas, who had come down with them from Jerusalem, and started upon his second missionary tour (Acts xv. 30-40). On this tour he first revisited the churches established at an earlier period in Syria and Cilicia as well as those founded on his first journey. From one of these latter churches he secured Timothy to be a helper in his work. From Antioch in Pisidia he essayed to go farther westward into the Province of Asia, but, being divinely forbidden, he turned northward with a view of entering the Province of Bithynia, but, his way again altered by the Holy Spirit, he at last arrived at the seacoast town of Troas in the old classical region of Troy (Acts xv. 41-xvi. 8).

It is probable, from his general policy of selecting the large city centres for his work, that Paul's purpose in this further extension of his journey beyond Antioch had been to go to Ephesus and, when forbidden to preach there, to go northward to Byzantium, which at that time was within the Province of Bithynia. The

divine prevention of this policy, confusing though it was, left him naturally convinced that the Master had for him some distinctive mission to perform. He was consequently in a receptive mood for the vision which came to him at Troas and called him across the water to Macedonia.

In obedience to this divine direction he entered upon his first European mission, passing down along the commercial highway that gave him entrance at the important towns of Philippi, Thessalonica, and Berea and finally brought him to Athens and Corinth (Acts xvi. 9-xviii. 1). At all of these places, as far as Corinth, his mission efforts had been somewhat disappointing, either having been broken off by persecution or, as was the case at Athens, received with indifference and contempt. As a consequence he came to Corinth (spring of 50 A.D.) in a despondent frame of mind (1 Cor. ii. 3). Here, however, his work was greatly blessed, and for a year and a half he and his companions remained in that region establishing churches, not only in Corinth itself, but throughout the Province of Achaia (Acts xviii. 2-11; 2 Cor. i. 1). It was during the early part of his stay in Corinth that, anxious for their welfare in the face of persecution, corrupting influences, and false teachings, he wrote his two letters to the Thessalonians, generally considered the earliest of his preserved writings (See THESSALONIANS, EPISTLES TO THE). From Corinth Paul returned (fall of 51 A.D.) by sea to Syria, stopping on the voyage at Ephesus long enough to preach in the synagogue and make promise of a return for more extended work. Landing finally at Cæsarea, he went up to Jerusalem with greetings to the Church and then returned to Antioch (Acts xviii. 18-22).

After some time spent there he set out upon his third mission tour (about 51-55 or 52-56 A.D.), visiting again the churches of southern Asia Minor, and then in fulfillment of his promise he proceeded on to Ephesus. At this large centre of activity and influence he remained at work for the greater part of three years, carrying the gospel, either personally or through his helpers, throughout the entire seacoast Province of Asia (Acts xviii. 23-xix. 20, xx. 17-35; 1 Cor. xvi. 19). During this period he was in frequent communication with the church of Corinth, whose problems of organization, Christian brotherhood, and moral life necessitated serious attention on the part of the Apostle. This produced considerable correspondence, portions of which are preserved in his Corinthian Epistles. It is quite clear that late in this period, in consequence of what seemed an urgent necessity, he made a hurried trip from Ephesus to Corinth by the direct route across the sea. The purpose of the visit was apparently to curb the rebellious and disorderly spirit of some of the members of the Corinthian church who were not only guilty of moral wrongdoing, but in a defiant and unrepentant mood. The visit was quite brief and resulted in a practical failure to straighten out the situation. The Apostle returned to Ephesus with a heavy heart. (See CORINTHIANS, EPISTLES TO THE.) Soon after this Paul felt obliged to leave Ephesus because of disturbances occasioned by pagan resentment at his increasingly successful work. Meanwhile he had made one more effort to win back the loyalty of the church of Corinth by dispatching thither Titus with a very touch-

ing letter. While waiting to hear Titus's report before venturing to visit Corinth again, he decided to revisit the Macedonian churches established on his previous journey (Acts xix. 23-xx. 1; 2 Cor. i. 23-ii. 13). It is quite likely that during the progress of this work he received the startling news from the Galatian churches which occasioned his letter to them. (See GALATIANS, EPISTLE TO THE.) Titus rejoined him in Macedonia with the cheering news that the Corinthian church had repented of its unseemly and ungracious attitude. Full of joy, Paul wrote 2 Cor. i-ix, sending it at once by Titus and intending to follow as soon as circumstances permitted. Reaching Corinth in the late autumn or early winter of 54 or 55 A.D., he remained there three months (Acts xx. 1-3). During this time of comparative leisure and freedom from anxiety he wrote his letter to the church at Rome—a church he had not founded or seen, but to the visiting of which he looked forward with earnest longing, and largely to prepare them for this visit he sent them this important letter. See ROMANS, EPISTLE TO THE.

In the spring of 55 or 56 A.D. he left Corinth for Jerusalem with quite a company, who doubtless represented the churches that had been engaged for some time in gathering a contribution for the mother church of Jerusalem (Acts xx. 4; see also Rom. xv. 25 f.; 1 Cor. xvi. 1-4; 2 Cor. viii-ix). After a journey which was accompanied by some incidents of a foreboding nature, to all of which Paul's mind seemed resignedly receptive, he reached Jerusalem (Acts xx. 3-xxi. 15). His reception by the brethren of the church was full of Christian fellowship; at the same time it was clear that the leaders were deeply impressed by the growing alienation from Paul among the believing Jews. As a consequence they suggested that he carry out in the temple a certain course of ceremonial observance designed to show his respect for the Law of Moses and to disprove the charge that he everywhere urged its abandonment by the Christian Jews. This he willingly did; but his presence in the temple was made the occasion of a ferocious onslaught upon him on the part of certain Jews, which would have ended his life but for the intervention of the soldiers of the adjoining Roman garrison (Acts xxi. 17-32).

It is clear from this incident, as presented in the passage cited, that the head and front of Paul's offending in the eyes of the Jews was not so much his heralding of the Messiahship of Jesus as his denial of the continued obligation of the Mosaic Law. This is instructive as to the large significance of the controversy which ensued upon his first mission journey and which, in spite of the wise action of the Jerusalem Council, wrought itself into the Galatian and to a certain degree into the Corinthian churches. Paul's position as to the absolute essentiality of the principle of justification by faith alone apparently went to the heart of the whole problem of salvation as it was present before the early Church.

Having found it impossible to secure from the excited mob any idea of the offense of which his prisoner was guilty, and Paul himself asserting his rights of Roman citizenship, the chief captain of the guard, Claudius Lysias, summoned a council of the Sanhedrin and brought Paul before it for examination (Acts xxi. 33-xxii. 30). This gathering, however, resulting in nothing but disorder among the members of the court,

and, information having been brought of a desperate plot against Paul's life by a secret band of Jews, Claudius Lysias sent him away by night under heavy guard to Felix, the Roman governor or procurator of Judæa, whose official residence was at Cæsarea (Acts xxiii).

Paul's stay at Cæsarea, which lasted two years, was practically a continued commitment for trial. He was given a preliminary hearing by Felix soon after his arrival at Cæsarea and defended himself against the accusations of the high priest Ananias and certain of the elders from Jerusalem, who were accompanied by counsel. But, though the prosecution failed to make out their case, no decision was rendered by the governor (Acts xxiv. 1-23). Later Paul was summoned privately before Felix and his wife to speak "concerning the faith in Jesus Christ," but, though the Apostle "reasoned of righteousness, temperance, and the judgment to come" in such a way as to make a terrifying impression upon Felix, the fear was wholly transient; for Paul was returned again to prison, where Felix kept him during the remainder of his term of office, arranging frequent interviews with him, in hope of securing from the Apostle a bribe for his release. Finally, in order to please the Jews, he handed him over bound to his successor Porcius Festus (Acts xxiv. 24-27).

Almost immediately upon the arrival of the new governor the Jews renewed their charge against Paul, but failed to make out their case. When, however, the governor seemed about to follow in his predecessor's steps and ignore the evidence presented, suggesting that Paul go up to Jerusalem for another trial, the Apostle, on the basis of his rights of citizenship, transferred the case to Rome by appealing to Cæsar. Such action left the governor no further choice, though he took the opportunity of Agrippa's presence in Cæsarea to bring Paul once more into court and to have his case heard by his royal visitor (Acts xxv). In his defense the Apostle presented before Agrippa the course of his life and the grounds of his Christian hope, persuading the King, as he had in fact both governors, that there was no reason for his being retained in bonds (Acts xxvi. 1-31). Beyond such personal impressions, however, his plea was of no use, since his appeal to the Emperor made transportation to Rome obligatory upon the authorities (Acts xxvi. 32).

The voyage to Italy was begun in the fall of 57 or 58 A.D., being marked by disastrous experiences which resulted in shipwreck on the island of Malta (q.v.). There the company remained through the winter, continuing their voyage in the spring and reaching at last their journey's end at the Imperial capital some time in the early half of the year 58 or 59 A.D. (Acts xxvii. 1-xxviii. 14). Here Paul was cordially welcomed by the Christian brethren of the city and kindly received by the authorities, being allowed to reside under guard in his own hired house, with freedom of intercourse among his friends and liberty of preaching his gospel (Acts xxviii. 15-31). It was during this period of imprisonment that he wrote his letters to the Philippians, the Colossians, Philemon, and the Ephesians. Of these, Philippians and Philemon, especially Philemon, dwell upon the Apostle's personal relation to the readers, though the practical problems of Christian brotherhood and moral living emerge quite clearly in Philippians.

On the other hand, Colossians and Ephesians were intended to counteract doctrinal errors of a subtle nature involving a large element of nascent Gnosticism. This is especially true of Colossians; Ephesians, as an encyclical letter, emphasizing rather the principles of Christian solidarity in the membership of the churches. See the articles on the above letters.

It is a matter of considerable debate as to what was the outcome of this imprisonment at Rome. The opinion adopted by the present writer is that after two years Paul was brought to trial before Nero and on the absence of any real evidence against him was released. After this release he resumed his missionary labors, possibly being able at last to fulfill his long-cherished hope of preaching the gospel in Spain (cf. Rom. xv. 24). He also appears to have revisited his former fields of activity (Ephesus, Greece, etc.; cf. 2 Tim. iv. 9-20) as well as Crete, Epirus, and other places (cf. Titus i. 5; iii. 12). In the midst of these labors he was re-arrested and transported again as a captive to Rome. At his second trial he was sentenced to death and suffered martyrdom not later than the year 65. Previous to his second arrest he wrote the letter to Titus and the first letter to Timothy, both of which have to do almost wholly with the practical matters of Church organization and discipline. His second letter to Timothy was written after his reimprisonment at Rome, shortly before his death, and is practically his last word of personal counsel and encouragement to his trusted helper and friend. See the articles on these letters.

The picture of Paul stands clearly before us in the records which the New Testament gives—a man of education, if not of culture, for his time—a Roman citizen and yet a Jew, a student of the Scriptures, a zealot in the law, and withal a conscientious seeker for the way of life within the circle of its precepts—consequently an earnest persecutor of the disciples of Jesus until divinely convinced of his error, when all his energy and enthusiasm and loyal devotion were transferred to his new life and infused into his new work. In this new life and work, however, Paul manifestly remained a Jew. He did not conceive of his Christianity as having severed him from the Israel of God, but rather as having enabled him to realize the ideal of Israel's Godward relations. His doctrinal thinking consequently found its historical and logical background in the Old Testament, rising through its anthropology and its soteriology to its climax in its Christology. His doctrine of Christ controlled all the rest of his theology, and, as this doctrine was fundamentally experiential rather than theoretical, Paul's whole theological system is fundamentally experiential rather than speculative. In all his thinking he was intense and characteristically logical, though he often clothed his thought in the old Rabbinic forms which he had brought with him from the Jerusalem schools, and frequently yielded to the rhetorical impulses more or less belonging to his intensity of nature. He was not metaphysical, even in treating the profoundest themes, but practical in the extreme and sympathetic on broad and comprehensive lines. Though his position in the matter of relationship to ceremonial Judaism was not that of the Jerusalem leaders, his views came to dominate the Church, and he himself became the Church's leader in its world work. On the theology of the Church

since his day his influence has not been even. Conceived of as a completely formulated system, it may be said that during the centuries immediately succeeding the apostolic age Paul's theology largely if not completely disappeared, being revived in its doctrine of man and of salvation in the theology of Augustine and receiving again at these points its conspicuous restoration in the essential position of the Protestant Reformation. Since then these Pauline doctrines have come and gone with the rise and fall of that trend of thinking which may be termed Calvinistic. This is true, however, only of Paul's theology as systematized by theologians and then incorporated into formal dogmatic theology. On the other hand, the spiritual life of the Church has ever been most profoundly influenced and nourished by the rich spiritual treasures of vital religious experience disclosed in Paul's letters, and there is no reason to suppose that it will ever be otherwise.

PAUL. The name of five popes.—**PAUL I** (Pope, 757-767), the brother of Stephen II, whom he succeeded. He was the candidate of the Frankish party, and as Pope maintained close relations with Pepin I, whose help he needed both against the Lombards and against the Greek Emperor, who had not given up his claims to the exarchate and the Pentapolis. Pepin, however, was constant in his support of the Pope and assured him a fairly peaceable possession of the ecclesiastical territory. Consult H. K. Mann, *Lives of the Popes*, vol. i, part ii (London, 1902).—**PAUL II** (Pope, 1464-71), Pietro Barbo. He was born at Venice in 1417, the nephew of Eugenius IV, to whom he owed his introduction to an ecclesiastical career. He was made Cardinal in 1440 and held a position of great influence under Nicholas V and Calixtus III. Pius II, however, did not regard him so favorably, and his election to the papacy as successor to Pius was largely due to the older cardinals, who had not been in sympathy with that pontiff. At the beginning of his reign he tried to form an alliance of Christian sovereigns against the Turks, but the circumstances of the time frustrated his purpose. He was obliged to oppose the claims of the French King, Louis XI, to absolute power, and demanded of him the repeal of the Pragmatic Sanction. He attempted to suppress the non-Christian or properly so-called humanistic Renaissance, especially by the dissolution of the Roman Academy, which had become a meeting place for the enemies of religion, and by severe penalties against the scholars who combined pagan doctrine with pagan immorality. Consult Mandell Creighton, *History of the Papacy*, vol. iv (New York, 1903), and Ludwig Pastor, *History of the Popes*, vol. iii (3d ed., London, 1910).—**PAUL III** (Pope, 1534-49), Alessandro Farnese. He was born in 1468, was educated in Rome by Pomponio Leto, and went to Florence, entering into close relations with the Medici. Alexander VI

made him Cardinal in 1493; later he became Bishop of Ostia and dean of the Sacred College. He held various important offices, twice representing the Pope during his absence as legate in Rome. He strongly advocated the calling of a general council and was a member of the commission appointed by Clement VII to consider the question. After his elevation to the papacy he vigorously pursued the reforming policy he had always advocated. He first summoned the council to meet at Mantua in 1536, then at Vicenza in 1538, and again at Mantua in 1542; but each time its assembly was prevented by the discord between Charles V and Francis I. It finally met at Trent in 1545. (See TRENT, COUNCIL OF.) Against Henry VIII of England he took decisive steps, finally issuing in 1538 the bull of excommunication and deposition prepared three years earlier. He took vigorous steps also for the suppression of Protestantism in Italy, reconstructing the Inquisition and establishing a strict censorship of books. (See INDEX.) The reproach of nepotism is brought against him. In 1545 he made his natural son, Pietro Luigi Farnese (born before his entry into priesthood), Duke of Parma and Piacenza. He did much for the stability of the Church and was as well a patron of art. He appointed Michelangelo architect in chief of the Vatican and of St. Peter's and provided for many great works. Consult Ludwig Pastor, *History of the Popes*, vol. viii (3d ed., London, 1908).

PAUL IV (Pope, 1555-59), Giovanni Pietro Caraffa. He was born at Naples in 1476. In 1494 he entered the service of the Curia and in 1507 was appointed Bishop of Chieti, in which see he labored most earnestly for the reformation of abuses and for the revival of religion and morality. With this view he established, in conjunction with several congenial reformers, the congregation of secular clergy called Theatines (q.v.) and was himself the first superior. It was under his influence that Paul III organized the tribunal of the Inquisition in Rome. On the death of Marcellus II in 1555, although in his seventy-ninth year, he was elected to succeed him. He enforced vigorously upon the clergy the observance of all the clerical duties and enacted laws for the maintenance of public morality. He established a censorship and completed the organization of the Roman Inquisition; he took measures for the alleviation of the burdens of the poorer classes and for the better administration of justice, not sparing even his own nephews, whom he banished from Rome on account of their corrupt conduct and profligate life. His foreign relations, too, involved him in much labor and perplexity. He was bitter in enmity against Charles and the Spaniards. He insisted on the restoration of Church property in England, a demand which Julius III had in the interests of peace refused to press, and recalled Pole, who had arranged the settlement; and on Elizabeth's accession declared her illegitimate and not entitled to the throne. He was embroiled with the Emperor Ferdinand, with Philip II of Spain, and with Cosmo, Grand Duke of Tuscany. Having condemned the principles of the Peace of Augsburg, he protested against its provisions. At home he was unpopular for his strictness and lack of tact. Consult Leopold von Ranke, *History of the Popes*, vol. i (London, 1908).—**PAUL V** (Pope, 1605-21), Camillo Borghese. He was born in

Rome in 1550. In his early life he was a distinguished canonist and theologian, and after the ordinary prelatical career at Rome he rose first to the post of Nuncio at the Spanish court and afterward to the cardinalate under Clement VIII. His pontificate is rendered memorable by the celebrated conflict with the Republic of Venice, into which he was plunged at the very outset of his career. The original ground of dispute was the question of the immunity of the clergy from the jurisdiction of civil tribunals. The Venetian Senate resisted the claim of the clergy to be tried by ecclesiastical tribunals, and further causes of dispute were added by a mortmain law, and a law prohibiting the establishment of new religious orders or associations unless with the sanction of the Senate. Each party remaining inflexible in its determination, Paul issued a brief, directing a sentence of excommunication against the Doge and Senate and placing the Republic under an interdict unless submission should be made within 24 days. The Senate persisted, and an animated conflict, as well of acts as of writings, ensued, in the latter of which the celebrated Fra Paolo Sarpi (q.v.) on the side of the Republic, and on the papal side Bellarmine (q.v.) and Baronius, were the leaders. Preparations were even made for actual hostilities; but, by the intervention of Henry IV of France, the dispute was accommodated and peace restored in 1607, although dissatisfaction afterward arose on the subject of the nomination of a patriarch. Paul's administration was vigorous and marked by the development of religious orders and missionary enterprise. He added to the splendors of Rome and the wealth of his own family. Consult his *Life* by T. A. Trollope (London, 1861), and Leopold von Ranke, *History of the Popes*, vol. ii (ib., 1908).

PAUL I, PETROVITCH (1754-1801). Emperor of Russia from 1796 to 1801. He was the son of Peter III and Catharine the Great. He underwent a vigorous training at the hands of his mother, and this served to harden and warp a nature which was by no means devoid of generous impulses. The memory of his father's violent death made him suspicious of all who surrounded him. During his mother's lifetime he was allowed no share in the government and with the exception of a journey abroad (1781-82) passed his time in brooding idleness on his estates at Gatchina. Catharine seriously contemplated the exclusion of Paul from the succession to the throne in favor of his son Alexander. Paul's reign began with fair promise, but speedily degenerated into an oppressive despotism which weighed alike on the court, the army, and the intellectual life of the nation. The system of police espionage was developed to a hitherto unparalleled degree, and swift punishment was visited on those unfortunate enough to arouse the slightest suspicion in the Emperor's diseased imagination. Nevertheless Paul I carried out a number of important reforms. He promulgated the new law of succession to the throne, which established the rule that the Russian throne should pass from father to son and to the eldest brother in case there was no son. In 1798 he prohibited the selling of peasants without land in the governments of Little Russia. In 1797 he prohibited the lords from working their serfs on holidays or more than three days a week. On his accession to the throne the peasants for the first time in Russian history were

admitted to take the oath of allegiance to the new sovereign. Paul also separated for the first time in Russian history the estates and incomes of the Imperial family from the estates of the state. Reluctant at first to enter the struggle against France, he finally joined the Second European Coalition against the French Republic in 1798, and in 1799 the Russian armies under Suvorov (q.v.) gained a series of notable victories over the French and drove them out of northern Italy. Bonaparte's astute diplomacy, however, succeeded in breeding dissension between the Russian Emperor and his allies. Paul's discontent was intensified by the conduct of England in refusing him possession of the island of Malta, to which he, as Grand Master of the Knights of Malta, laid claim. His opposition to England finally developed into open hostility and led in 1800-01 to the formation of the Northern Maritime League by Russia, Sweden, and Denmark against Great Britain. At home, meanwhile, Paul's despotism had become unendurable, and a conspiracy was formed by some of the highest officials about the court to bring about the Emperor's abdication in favor of his son Alexander. The leaders of the conspiracy were Count Pahlen, Count Panin, Prince Subov, General Bennigsen, and General Uvarov. Alexander knew all about the conspiracy and practically directed it. On the night of March 23, 1801, the Imperial palace was surrounded by the troops of Count Pahlen, while the conspirators, some 30 in number, broke into Paul's chamber and at the sword's point demanded that he sign the act of abdication. No certain knowledge exists of what then occurred, but it would seem that the Emperor, crazed with fear, attempted resistance, that a scuffle ensued, and that in the struggle Paul was killed. Of Paul's 10 children, Alexander and Nicholas ruled over Russia, while Constantine was a prominent figure during the reign of the latter. Consult: Kobeko, *Der Casarewitsch Paul, 1754-96* (Berlin, 1886); Brenemann, *Aus den Tagen Kaiser Pauls* (Leipzig, 1886); K. Waliszewski, *Paul I* (London, 1913).

PAUL, APOCALYPSE OF. See *APOCRYPHA, New Testament*.

PAUL, HERBERT WOODFIELD (1853-). An English biographer and historian, educated at Eton and at Oxford, where he was president of the Union and distinguished as a student. He became a barrister in 1878, and he sat in Parliament from 1892 to 1899 and from 1906 to 1909. His books include: *Men and Letters* (1901); *Life of Gladstone* (1901); *Matthew Arnold*, in the "English Men of Letters Series" (1902); *History of Modern England* (5 vols., 1904-06); *Lord Acton* (1904); *Life of Froude* (1905); *Famous Speeches* (1910).

PAUL, pouL, HERMANN OTTO THEODOR (1846-). A German philologist. He was born in Magdeburg, studied at Berlin and Leipzig, and in 1874 became professor in the University of Freiburg. In 1893 he was appointed professor of German philology at the University of Munich. His publications include: *Gab es eine mittelhochdeutsche Schriftsprache?* (1873); *Zur Lautverschiebung* (1874); *Kritische Beiträge zu den Minnesingern* (1876); *Zur Nibelungenfrage* (1877); *Mittelhochdeutsche Grammatik* (1881; 7th ed., 1908); *Deutsches Wörterbuch* (1896; 2d ed., 1908). He is best known in the United States by his *Prinzipien der Sprachgeschichte* (1880; 4th ed., 1909), translated into

English by Strong (1888) and retranslated with changes by Strong, Logeman, and Wheeler (1891). As editor of *Grundriss der germanischen Philologie* (1888-93; 2d ed., 1896-1900; rev. ed., 3 vols., 1901-09) he rendered valuable service to modern philology. After 1874 Paul, with W. Braune, edited the *Beiträge zur Geschichte der deutschen Sprache*, of which 15 volumes were issued during his editorship. His editions of Hartmann von Aue's *Gregorius* (Halle, 1873-76; 2d ed., 1910), *Kalewala, das Volksepos der Finnen* (1885-86), and of Walther von der Vogelweide (Halle, 1882; 2d ed., 1911) are also noteworthy.

PAUL, JEAN. See RICHTER, JOHANN PAUL FRIEDRICH.

PAUL, päl, (CHARLES) KEGAN (1828-1902). An English publisher and author, born at White Lackington, Somersetshire. He was educated at Eton and at Exeter College, Oxford, from 1853 to 1862 was a master at Eton, and, after 12 years as vicar of Sturminster, left the Church of England and later became widely known in the publishing business, from which he retired in 1899. He was the publisher of the monthly periodical, the *Nineteenth Century*, of the *International Scientific Series*, and of the works of several famous writers. As an author he is best known for his biographies and translations: *A Translation of Faust* (1873); *Life of William Godwin* (1876); *Letters of Mary Wollstonecraft* (1879); *Biographical Sketches* (1883); *Maria Drummond* (1891); Huysmans's *En Route* (1896); *Memories* (1899). In *Faith and Unfaith* (1891) Paul hinted at his own religious beliefs; he had left the Church of England for Positivism, but in his last years entered the Roman Catholic church.

PAUL, LEWIS (?-1759). An English inventor, of whose life very little is known. About 1729 he invented a pinking machine, and his acquaintance with Dr. Samuel Johnson seems due to the fact that Mrs. Desmoulins had learned pinking from him. Paul's important patent dates from 1738, and it is the earliest machine for the spinning of wool or cotton by two pairs of revolving rollers. The factories established at Birmingham and Northampton met with no success. Two other patents taken out by Paul were a carding machine (1748) and a spinning machine (1758). They seem to have been no more successful than the one first constructed, which, however, was the basis of Arkwright's invention.

PAUL, poul, OSKAR (1836-98). A German writer on music, born at Freiwaldau, Silesia. He was a pupil of Klingenberg at Görlitz, then of Plaids, Richter, and Hauptmann at the University of Leipzig, and after sojourns in different German towns he returned to Leipzig (1866) to give private lessons in harmony. Three years afterward he began to teach musical history in the conservatory of that city, and in 1872 he was appointed professor extraordinarius at the university. He founded and edited the periodical *Tonhalle*, which was merged into the *Musikalische Wochenblatt*; published Hauptmann's *Lehre der Harmonik* (1868); wrote *Geschichte des Claviers* (1869) and *Handlexicon der Tonkunst* (1871-73); and made the first German translation of Boëthius (1872).

PAUL, pöl, VINCENT DE. See VINCENT DE PAUL, SAINT.

PAUL, päl, VISION OF. See APOCRYPHA, *New Testament*.

PAULA, SAINT FRANCIS OF. See FRANCOIS OF PAOLA, SAINT.

PAUL AND VIRGINIA (Fr. *Paul et Virginie*, pöl'ä-vërzhé'né'). A well-known romance by Bernardin de Saint-Pierre (1788), the scene of which is laid in Mauritius, where the author had spent three years.

PAUL CLIFFORD. A novel by Bulwer-Lytton (1833). It is the story of a chivalrous highwayman in the time of the French Revolution.

PAULDING, HIRAM (1797-1878). An American naval officer. He was born in New York City, entered the United States navy as a midshipman in 1811, participated in the battle of Lake Champlain (Sept. 11, 1814), receiving a vote of thanks and a sword from Congress for his services, served under Commodore Decatur against the Barbary Powers in 1815, and in the following year was promoted to a lieutenantancy. He accompanied Commodore Porter on an expedition against the West Indian pirates in 1822-23, acting as first lieutenant of the *Sea Gull*, said to have been the first steamer ever used for purposes of war; served on the *Dolphin* in 1826 when that vessel was sent to the Mulgrave Islands in search of the mutineers of the American whale ship *Globe*; cruised in the East Indies, in command of the *Vincennes*, from 1844 to 1847; was in command of the Washington Navy Yard from 1851 to 1854; and from 1854 to 1857 was commander of the home squadron, at the time the highest position in the navy. For arresting the filibuster Walker (see WALKER, WILLIAM) at Greytown, Nicaragua, in December, 1857, he was relieved from command by President Buchanan, though the Republic of Nicaragua in recognition of his services presented him with a sword and a large tract of valuable land, which latter Congress did not allow him to accept. On the outbreak of the Civil War he was ordered to Washington to assist Secretary Welles of the Navy Department and in April, 1861, proceeded to Norfolk and destroyed the navy yard there. Having passed the age limit of 62 years, he was technically retired in December, 1861. In the following year he was promoted to the recently created grade of rear admiral, on the retired list, and subsequently was commandant of the New York Navy Yard from 1862 to 1866, in which position he rendered important services to the government by sending many vessels and thousands of men to the front; was Governor of the Naval Asylum in Philadelphia from 1866 to 1869, and was port admiral at Boston from 1870 to 1871. He published a *Journal of a Cruise among the Islands of the Pacific* (1831). Consult R. P. Meade, *Life of Hiram Paulding* (New York, 1910).

PAULDING, JAMES KIRKE (1779-1860). An American author, born in Nine Partners, Dutchess Co., N. Y. After a scanty education he went to New York, where with William Irving, his brother-in-law, and with Washington Irving, he collaborated in *Salmagundi* (1807), the second series of the same (1819) being by Paulding alone. During the War of 1812 he published the *Diverting History of John Bull and Brother Jonathan*; and in 1814 the *United States and England*, a defense against British criticisms. This work attracted attention and caused him to be appointed secretary of the board of navy commissioners. In 1816 he published a defense of the Southern States and of

slavery in *Letters from the South, by a Northern Man*; in 1822, *A Sketch of Old England, by a New England Man*; and in 1824 *John Bull in America, or the New Munchausen*, a satire on the writings of British tourists. Meanwhile he had published his first novel, *Königsmarke* (1823). *Merry Tales of the Three Wise Men of Gotham* (1826) followed, and other books, mainly humorous and satirical. In 1831 he produced *The Dutchman's Fireside*, a novel dealing with the old Dutch settlers. This, his best work, was followed by *Westward Ho!* (1832), a novel dealing with Kentucky. Next came a good biography of Washington (1835) and *Slavery in the United States* (1836). Meanwhile he had been navy agent at New York City since 1825, a position from which he was advanced in 1837 to the post of Secretary of the Navy in Van Buren's cabinet. On his retirement in 1841 he went to a country residence at Hyde Park, where he wrote a few stories and plays, the novel, *The Puritan and his Daughter* (1849), being the most conspicuous. There he died, April 6, 1860. His select works appeared in four volumes (1867-68). Consult *Literary Life of James K. Paulding*, by his son William (New York, 1867).

PAULDING, JOHN (1758-1818). An American Revolutionary soldier, born in New York City. He, together with Isaac Van Wart and David Williams, captured Major André near Tarrytown, Sept. 23, 1780, and for this received from Congress a silver medal. He was a prisoner three times during the Revolutionary War, being released the second time only four days before André's capture.

PAUL-DUBOIS, pól-du'bwá', LOUIS FRANÇOIS ALPHONSE (1868-). A French economist, born in Paris. He attended the Lycée Louis-le-Grand and became a lawyer and referee of the Audit Office. Himself a son of the painter and sculptor Paul Dubois (q.v.), he married a daughter of the critic Hippolyte Taine (q.v.). He wrote: *Les chemins de fer aux Etats-Unis* (1896); *Les finances communales* (1898), which received the Faucher prize of the Academy of Moral and Political Sciences; *Frédéric le Grand d'après sa correspondance politique* (1902), awarded the Montyon prize by the French Academy; *L'Irlande contemporaine et la question irlandaise* (1907; Eng. trans., *Contemporary Ireland*, 1908).

PAULET, WILLIAM. See WINCHESTER, WILLIAM PAULET, MARQUIS OF.

PAULHAN, pó'lyán', LOUIS (1883-). A French aviator, who was early employed as a mechanic in a balloon factory. He won a prize for designing a model aeroplane, and by 1909, when he visited America, he had become generally known for successful flights. In April, 1910, he won the *Daily Mail* £10,000 prize for an aeroplane flight from London to Manchester. Paulhan became a lieutenant of reserve in the French Aviation Corps and participated in the military manoeuvres of 1910. On the outbreak of the European War (1914), he left his Riviera farm, where for two years he had been growing flowers for the London market, was sent to Serbia, and for bringing down an Austrian aeroplane was promoted captain in the flying corps.

PAULI, pou'le, REINHOLD (1823-82). A German historian. He was born in Berlin, studied there and at Bonn, and lived for several years in England, in antiquarian research and as

secretary to the Prussian Ambassador, Bunsen. In 1866 he lost his professorship at Tübingen because of an attack on the policy of Württemberg. In the following year he was appointed professor at Marburg and in 1870 at Göttingen. His historical works are marked by a lucid style and by painstaking research. They include: *König Aelfred und seine Stelle in der Geschichte Englands* (1851); a continuation of Lappenbergs *Geschichte von England* (1853-58), an able work; *Bilder aus Altengland* (1860; 2d ed., 1876); *Geschichte Englands seit den Friedensschlüssen von 1814 und 1815* (1864-75); *Simon von Montfort* (1867); *Aufsätze zur Englischen Geschichte* (Leipzig, 1869; n. s., 1883); and a sketch of Cromwell (1874). Pauli edited in 1856 Gower's *Confessio Amantis*.

PAULICIANS, pá-lí-sh'anz. An Oriental Christian sect, which flourished in the eighth and ninth centuries, although survivors are found much later. It has generally been represented as an offshoot of the Manichæans (see MANICHÆISM), but recent investigations make it probable that it is of independent origin. In a work entitled *The Key of Truth*, dating in its present form probably from the ninth century, and representing the contemporary usages and beliefs of the Paulicians in Armenia, survivals of ancient baptismal and ordination forms are found, which indicate some connection between this church and the older Adoptionists. The Adoptionists taught that Christ was a man who at his baptism became by adoption the Son of God instead of being so by nature or eternally (the Catholic doctrine). This type of Christology goes back to the end of the second century, when it was brought to Rome by Theodotus. (See MONARCHIANS.) The origin of the name Paulicians is uncertain, but an eleventh-century opponent of the movement traces it to Paul of Samosata (q.v.), Bishop of Antioch in the latter part of the third century, the last great Adoptionist teacher, and this is the most plausible derivation yet suggested. Ancient writers like Petrus Siculus and Photius (ninth century) say that Paulicianism arose in Armenia some 200 years before their time. Their leader was one Constantine (Sylvanus), and the sect stood in opposition to the catholicoi, or head of the national church, on several points of doctrine and practice. They rejected the authority of the hierarchy and chose religious leaders of their own, the "elect ones," wherein lies one resemblance between them and the mediæval Manichæan sects. These facts have led many writers to speak of them as "Protestants." In the ninth century the Paulicians enjoyed a vigorous ecclesiastical life, especially under a leader named Baanes, from whom they are sometimes known as Baanites, but they were subjected to severe and repeated persecution at the hands of the Church and of the Byzantine Emperors. Under such provocation they for a time joined forces with the Mohammedans against all Christian powers. In the eighth century and again in the tenth some of them were removed from Asia Minor to the upper part of the Balkan Peninsula, to serve as an outpost against the Slavic tribes of the north, and thus a considerable Paulician population was established in Europe. Their influence penetrated into Bulgaria, and here no doubt is one source of those mediæval movements generally classed as Manichæan, which include the Bogomiles, Cathari, and Albigenses (qq.v.), and may have influenced the

prereformation evangelical movements. A few surviving Paulicians were discovered in south-eastern Europe in the eighteenth century, and larger numbers of them in Armenia in the nineteenth. Here was found their book, *The Key of Truth*, which has thrown new light on some obscure points of their history. Consult: F. C. Conybeare, *The Key of Truth* (Oxford, 1898); A. H. Newman, *Manual of Church History*, vol. i (new ed., Philadelphia, 1900); H. F. B. Lynch, *Armenia, Travels and Studies* (2 vols., London, 1901); W. F. Adeney, *Greek and Eastern Churches* (New York, 1908); Edward Gibbon, *Decline and Fall of the Roman Empire*, vol. vi (ed. by J. B. Bury, London, 1912).

PAULINE EPISTLES. A group of New Testament letters claiming in their superscriptions to have been written by the Apostle Paul and comprising the following 13 writings: Romans, 1 Corinthians, 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 Thessalonians, 2 Thessalonians, 1 Timothy, 2 Timothy, Titus, Philemon. For detailed discussion, see the articles on the separate Epistles.

PAULINUS, MEROPIUS PONTIUS ANICIUS, SAINT (353-431). He was born at Bordeaux, France, and became a pupil of the poet Ausonius, who secured for him the favor of the Emperor Gratian. He attained the dignity of *consul suffectus* and married a wealthy Spanish lady named Therasia. Through the efforts of St. Ambrose he was converted to Christianity, distributed most of his property among the poor, and continued for a time to reside in Spain. He was ordained a priest in 393 at Barcelona, but soon left Spain for Rome. In 394 he went to Nola, where he had an estate. Near the city was the tomb of the martyr Felix, over which a church had been built, with a few cells for pilgrims. Here Paulinus lived for 15 years in a strictly monastic fashion, except that his wife seems to have been with him, as a sister. In 409 he was made Bishop of Nola, a position which he retained till his death. He was present at the Council of Ravenna in 419. Of his works there have been preserved 50 epistles, 32 poems, and a tract called *Passio S. Genesii Arelatensis*. His name is of frequent occurrence in the letters of Augustine and Jerome. The works of Paulinus will be found in vol. lxi of Migne's *Patrologia Latina* (Paris, 1861), and in vol. xxviii of the Vienna *Corpus Scriptorum Ecclesiasticorum Latinorum*. Consult Lagrange, *Saint Paulin de Nole* (Paris, 2d ed., 1882), and P. Reinelt, *Studien über die Briefe des heiligen Paulin von Nola* (Breslau, 1904).

PAULINUS, SAINT (died 644). A missionary sent in 601 by Pope Gregory I to England, where he joined Augustine (q.v.). In 625 he was made Bishop by Archbishop Justus of Canterbury and went to Northumbria, in attendance on Ethelburga, daughter of Ethelbert, King of Kent, and wife of Edwin (q.v.), King of Northumbria. Edwin was still a pagan at the time, but in 627, through the influence of his wife and Paulinus, he caused himself to be baptized, together with many others. Soon afterward Paulinus founded the cathedral at York. On the overthrow of King Edwin in 633 the Northumbrians relapsed into heathenism, and Paulinus fled to Kent, where he became Bishop of Rochester. He died Oct. 10, 644. Consult: William Bright, *Early English Church History* (Oxford, 1858); Alfred Plummer, *The Churches in Britain before A. D. 1000*, vol. i (London,

1911); Hugh Williams, *Christianity in Early Britain* (Oxford, 1912); *Cambridge Medieval History*, vol. ii (New York, 1913).

PAULISTS. The ordinary designation of the Congregation of Missionary Priests of St. Paul the Apostle. This is a society founded in New York in 1858 by Father Hecker (see HECKER, ISAAC THOMAS) and some other priests. Their desire was to form a community of priests for missionary work in America composed chiefly of those whose native tongue was English; Hecker and his companions had left the Redemptorists largely on the ground that the members of that order working in America were mostly of German birth and did not understand the needs of the country. The plan was approved by Archbishop Hughes and received the papal confirmation from Pius IX. The mother house of the community, most of whose members are converts from Protestantism, is in New York. The Paulists devote themselves especially to mission preaching and have been the main promoters of the remarkable movement originating in the last years of the nineteenth century towards a systematized effort to extend their faith among the non-Catholics of America, which has taken shape in the foundation of a central training house for such work at Washington. Their magnificent church in New York is noted for the perfection of its services, both in the direction of punctilious carrying out of the rubrics and of Gregorian music. They also carry on the Catholic Publication Society work, with a printing plant of their own, and publish a monthly magazine called the *Catholic World*. They numbered, in 1914, 64 fathers and had establishments in New York, Washington, Chicago, Winchester, Tenn., Austin, Tex., Portland, Oreg., and San Francisco. Consult N. A. Hewitt, *Memoir of the Life of Francis A. Baker* (7th ed., New York, 1889), and Walter Elliott, *The Life of Father Hecker* (ib., 1899).

PAULITES (ML. *Paulita*, from Lat. *Paulus*, Paul). 1. An order of hermits which arose in Hungary by the union of two earlier communities, those of Patach and Pisilia, under Eusebius of Gran, the founder of the latter, who united both of them in 1250 and became the first superior of the joint order. Eusebius died in 1270; the rule of St. Augustine was adopted in 1308, and the order, which was confirmed by Pope John XXII, spread throughout northern Europe until it numbered 170 cloisters in Hungary alone, in which country many of its members filled the highest ecclesiastical offices. In the political disturbances of the eighteenth century most of the houses were suppressed, but a few still exist in Galicia, Poland, and Cracow. 2. An order in Portugal, said to have been founded in 1420, whose constitution was approved by Gregory XIII in 1578. It was later suppressed. 3. An order in France, commonly called the Brothers of Death (see DEATH, BRETHREN OF), approved by Paul V (1620) and suppressed by Urban VIII in 1633. 4. Blind Sisters of St. Paul, founded in Paris in 1852 to assist blind women and children. 5. Sisters of St. Paul of Chartres, known as the Hospitaliers of Chartres. It was founded in the latter part of the eighteenth century, for the teaching and care of the sick and poor. It has spread to the West Indies and the Far East and the Philippines. Consult Max Heimbucher, *Orden und Kongregationen* (Paderborn, 1907).

PAULITSCHKE, pou-lieh'ke, PHILIPP VIKTOR (1854-09). An Austrian geographer and explorer of northeastern Africa. He was born at Tschermakowitz, Moravia, was educated in the universities of Graz and Vienna, and in 1889 was appointed docent in the University of Vienna. His first trip to Africa was in 1880, when he made ethnological studies in Egypt and Nubia; but the expedition undertaken in 1884, starting from Harar and going south through Somaliland, was much more important, especially as it covered new territory in Galla. Paulitschke's writings include: *Die geographische Erforschung des afrikanischen Kontinents von den ältesten Zeiten bis auf unsere Tage* (1876; 2d ed., 1880); *Die Afrika-Literatur von 1500 bis 1750* (1882); *Geographische Verkehrslehre* (1881; 2d ed., 1892); *Die geographische Erforschung der Adäländer und Harärs in Ostafrika* (1884); *Die Sudanländer* (1885); *Beiträge zur Ethnographie und Anthropologie der Somali, Galla und Harari* (1886); *Die Wanderungen der Oromó* (1888); *Ethnographie Nordostafrikas* (1893-96).

PAULLINIA, pgl-lin't-ä (Neo-Lat., named in honor of C. F. Paullini, a German botanist, 1643-1712). A climbing plant of the order Sapindaceae, native in Brazil, and sometimes called Brazilian cocoa. A paste made of the crushed seeds and leaves of *Paullinia sorbilis* or *Paullinia cupana* is called guarana and is used in medicine. The dried paste occurs in brown cakes or sticks, with an odor of chocolate and a bitter taste, partly soluble in water and in alcohol. It yields an alkaloid, guaranine, which is considered to be identical with caffeine (q.v.) and has the same therapeutic and physiological effects.

PAULMY, pôl'mé', MARQUIS DE. See ARGENTON, M. A. RENÉ DE VOYER, MARQUIS DE PAULMY.

PAULO AFFONSO, pou'lô äf-fôn'so, FALLS OF. See SÃO FRANCISCO.

PAUL OF MIDDELBURG (1445-1534). A Dutch mathematician, born at Middelburg, whence his name. He studied at the University of Louvain, took orders, became canon of St. Barthélemy at Middelburg, and also taught mathematics, medicine, philosophy, and theology there. He then went to Louvain, where he lectured on mathematics so successfully that the Grand Council of Venice offered him the chair of mathematics at Padua. By 1484 he was at the court of Francesco Maria della Rovere, Duke of Urbino, to whom he became physician and by whom he was appointed to the abbacy of Castel Durante. It was also at the instigation of the Duke that he was elected Bishop of Fossombrone in 1494. In 1513 he presided at the Fifth Lateran Council (1512-17), where he spoke on the necessity of a revision of the existing calendar, later undertaken by Gregory XIII. His publications include: *Practica de Parvis Constellationibus* (1484); *Epistola Apologetica Magistri Pauli de Middelburgo* (1487), in which he answers various objections raised by mathematicians against a revision of the Julian calendar; and *Paulinae de Recta Paschæ Celebratione, etc.* (1513), in which he demonstrates with much learning that, owing to defective reckoning, the Easter festival was frequently celebrated at a period a month earlier than that determined by the Council of Nice. Consult Baldi, *Cronica de' matematici* (Urbino, 1707), and De Paquot,

Mémoires pour servir à l'histoire littéraire de dix-sept provinces des Pays-Bas (Louvain, 1763-70).

PAUL OF SAMOS'ATA. Bishop of Antioch in the third century. Beyond the fact that he was born at Samosata, little is known of his early life. He was at first a sophist and obtained admittance among the clergy in some unknown way. He became Bishop of Antioch (260), probably through the influence of Zenobia, Queen of Palmyra. He was a Monarchian, and his opponents do not give a good account of him. They assert that his character previous to his appointment was in some respects unworthy of the episcopal office, and that after his elevation he was rapacious, arrogant, and vain. His heresies caused several councils to be convened to consider his case; by the last of these, held about 269, he was divested of his office and excommunicated. Trusting to the favor of both Queen Zenobia and the populace, he refused to vacate the episcopal residence, in which also the meetings of the Church were held. In 272 the Emperor Aurelian, having conquered Zenobia, restored Paul's case to the bishops of Rome and of Italy, and they decided against him. There is no notice of either the time or place of his death. Consult Adolf Harnack, *History of Doctrine*, especially vols. iii, iv (trans. from 3d Ger. ed. by Neil Buchanan, Boston, 1897, 1898).

PAUL OF THEBES, SAINT (ST. PAUL THE HERMIT) (c.235-c.347). The first well-known hermit in the Christian Church, called by St. Jerome the founder of monasticism. He was born at Thebes in Upper Egypt and at the age of 15 fled to the desert to escape the Decian persecution. Here he lived about 100 years in prayer and mortification and trained St. Antony to be his successor in the leadership of those who sought an ascetic life in retirement from the world. Consult Joseph Bidez, *Deux Versions Grecques inédites de la vie de S. Paul de Thèbes* (Ghent, 1900), and Nau, in *Analecta Bollandiana* (Brussels, 1901). See ANTONY, SAINT.

PAUL OF THE CROSS, SAINT (1694-1775). The founder of the Order of Passionists (q.v.). His original name was Paolo Francesco Danei, he was born at Ovada, near Genoa. With a few companions he began to live a hermit's life on Monte Argentario, where he believed that God revealed to him that he should found a new order, even showing him its destined habit. The Bishop of Alessandria after careful investigation clothed him with this habit and allowed him even as a layman to preach repentance and conduct spiritual exercises. In 1727 he was ordained priest, and 10 years later the first permanent settlement of Passionists was made on Monte Argentario; from this time the founder took the name of Paul of the Cross. After a life of penance and labor he died in Rome, Oct. 18, 1775. He was canonized by Pius IX in 1867. Consult his *Life* by the Passionist Father Pius (New York, 1867); R. P. Louis-Thérèse, *Histoire du Saint Paul de la Croix* (4th ed., Paris, 1888); C. P. Luke, *A Great Apostle of the Crucified* (Rome, 1878).

PAULOWNIA, pgl-lô'n'i-ä (Neo-Lat., named in honor of Anne Paulovna, daughter of Paul I, Czar of Russia). The common and generic name of an ornamental Japanese tree, *Paulownia tomentosa*, of the family Scrophulariaceae, which attains a height of 20 to 40 feet. It has some-

what the appearance of a catalpa, the heart-shaped leaves being similar but much more downy. The flowers, borne in panicles in spring, are fragrant, violet-colored, 2 inches long, somewhat cylindrical, with rounded lobes at the mouth. The tree was formerly much planted in the United States, but, not proving equal to expectation, has lost in popular favor. It is not hardy north of New York, and even there and farther south it often fails to bloom for several seasons in succession. The branches are crooked, spreading, and nearly horizontal. Since the large flower buds are carried over winter, severe cold generally blights them. The growth of the tree in a favorable climate is very rapid and vigorous, and it grows wild to some extent in the South. When annually cut to the ground, it is said to form a good hedge of young growths remarkable for the striking appearance of the leaves.

PAUL PRY. A comedy by John Poole, produced in 1825. The title character is an exceedingly curious, meddlesome person.

PAULSEN, poul'zen, FRIEDRICH (1846-1908). A German philosopher of the Neo-Kantian school. He was born July 16, 1846, at Langenhorn, Schleswig, and studied at Erlangen and at Berlin, where he became docent in 1875 and in 1878 professor of philosophy and pedagogy, and where his lectures were among the most widely attended in Germany. He died at Steglitz, near Berlin, Aug. 14, 1908. His chief works in education are "Gründung, Organisation und Lebensordnungen der deutschen Universitäten im Mittelalter," in Sybel's *Zeitschrift* (1881); *Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (1885; 2d ed., 1896); *Realgymnasium und humanistische Bildung* (1889); *Höhere Schulen und Universitätsstudium im 20. Jahrhundert* (1901). As a philosopher Paulsen ranks as a disciple of Fechner in metaphysics, holding his pan-psychic doctrine and agreeing with him as to the parallelism between physical and mental. In general, his agreement with Fechner is best seen in the widely known *Einleitung in die Philosophie* (1892; 7th ed., 1900), of which an English version appeared in 1895 (2d ed., New York, 1907). His other works are: *Versuch einer Entwicklungsgeschichte der kantischen Erkenntnistheorie* (1875) and the supplementary work *Immanuel Kant* (1898; 2d ed., 1899; Eng. trans., New York, 1902); *Kant der Philosoph des Protestantismus* (1899); *Schopenhauer, Hamlet, und Mephistopheles* (1900), a series of essays; *Philosophia Militans* (1900; 2d ed., 1901); *Das deutsche Bildungswesen in seine geschichtlichen Entwicklung* (1906; Eng. trans., New York, 1908); *Ethik* (1889; 5th ed., 1899; partial Eng. version, 1899; new ed., New York, 1906); *Die deutschen Universitäten und das Universitätsstudium* (Berlin, 1902; Eng. trans., New York, 1906); *Richtlinien der jüngsten Bewegung im höheren Schulwesen Deutschlands* (1909).

PAULSEN, poul'sen, JOHN OLAF (1851-). A Norwegian poet and novelist, born at Bergen. He started life as clerk in the Portuguese consulate. In 1875 he published a collection of novels, *Af Bylivet*, which brought him recognition. There followed a collection of poems, *Moll og Dur* (1876), and the novel *Sjødronningen* (1876). Through Henrik Ibsen's recommendation he attained a stipend and went to live abroad. Among his many

novels are: *Dorothea* (1877); *Margherita* (1880); *Norsk Provinsliv* (1881); *Langt fra Norge* (1882); *Moderne Damer* (1883); *Kunstnervaturer* (1895); *Bergenske Originaler* (1904). *Nye Melodier* (1894) and *I September* (1897) are collections of poems. In *Mine Erindringer* (1900) and *Nye Erindringer* (1902) he tells in a pleasant way of his acquaintance with famous men and women in literature and art. Of importance in this field is his *Samliv med Ibsen* (1906).

PAULS VALLEY. A city and the county seat of Garvin Co., Okla., 56 miles south of Oklahoma City, on the Washita River, and on the Gulf, Colorado, and Santa Fe and the Atchison, Topeka, and Santa Fe railroads (Map: Oklahoma, D 4). It is the seat of a State training school for boys. Among the industrial establishments are a cotton compress and a bit and spur factory. The water works are owned by the city. Pop., 1900, 2157; 1910, 2689.

PAULUS, pou'lus, HEINRICH EBERHARD GOTTLÖB (1761-1851). A German theologian and one of the leaders of the Rationalist school. He was born at Leonberg, near Stuttgart, Sept. 1, 1761. He studied Oriental languages at Göttingen, London, and Paris. In 1780 he was called to the professorship of Oriental languages at Jena and in 1793 became professor of theology. Here he especially signalized himself by the critical elucidation of the Scriptures of the Old and New Testament on rationalistic principles. In 1811 he accepted the professorship of exegesis and ecclesiastical history at Heidelberg. He died Aug. 10, 1851. Among his numerous writings may be mentioned: *Clavis über die Psalmen* (1791); *Clavis über Jesaias* (1793); *Philologisch-kritischer und historischer Kommentar über das Neue Testament* (1800-04); *Sammlung der merkwürdigsten Reisen in den Orient* (7 vols., 1792-1803); *Leben Jesu, als Grundlage einer reinen Geschichte des Urchristentums* (1828); *Aufklarende Beiträge zur Dogmen-, Kirchen- und Religionsgeschichte* (1830); *Exegetisches Handbuch über die drei ersten Evangelien* (1830-33). He edited a collection of Eastern travels (1792-1803) and of Spinoza's works (1802-03). Consult Paulus, *Skizzen aus meiner Bildungs- und Lebensgeschichte zum Andenken an mein 50 jähriges Jubiläum* (Heidelberg, 1829), and Reichlin-Meldegg, H. E. G. *Paulus und seine Zeit* (Stuttgart, 1853).

PAULUS, pa'lus, JULIUS. A distinguished Roman jurist, who lived in the latter half of the second century and the earlier decades of the third. He was an assessor or associate justice under Papinianus, when the latter was prætorian prefect or chief justice of the Empire, in the reign of Septimius Severus; was exiled by Elagabalus, was recalled and made prætorian prefect by Alexander Severus. Paulus was one of the most fertile of Roman legal writers. In addition to commentaries on the civil law (16 books) and on the prætorian or equity law (78 books), he published a great number of monographs on special topics and 48 books of "questions" and "responses." He published also a succinct presentation of the entire law, civil and prætorian, under the title of *Sententiæ* (five books), and two books of "institutes" for beginners. He was regarded by the later Romans as the equal of his contemporary, Ulpian, and as inferior only to Papin-

ianus. His style, however, is less clear than Ulpian's. Excerpts from his writings make up more than one-sixth of the Digest of Justinian. A part of his *Sententia* has come down to us in the Breviary of Alaric (q.v.), and this text is included in Huschke, *Jurisprudentia Antejustinianæ quæ Supersunt* (4th ed., Leipzig, 1879). A fuller text, which includes the passages preserved in the Digest, may be found in Krüger, Mommsen, and Studemund, *Collectio Librorum Juris Antejustiniani* (Berlin, 1878-90).

PAULUS, LUCIUS ÆMILIUS. A Roman general. See ÆMILIUS PAULUS.

PAULUS DIACONUS (Lat., Paul the deacon) (c.720-c.800). The historian of the Lombards. He was descended from a noble family which had settled in Friuli. He received an excellent education either at Pavia or Friuli and was at the former city while King Ratchis (744-749) ruled there, and probably became the tutor of Adelperga, daughter of King Desiderius. For Adelperga he wrote his *Historia Romana*, which was chiefly a compilation of works still in our possession and was greatly used as a textbook for centuries after. The date when Paul entered the monastery at Monte Cassino is uncertain. In 782 he journeyed to the court of Charles the Great in order to obtain the release of his brother and other captive Lombards. His mission was successful, while he himself was induced by King Charles to remain and lend his aid in the reawakening of learning. It was here that he made his collection of homilies, known as *Homiliarium*, which have been translated into many languages. At the request of Bishop Angilram of Metz he also wrote *Gesta Episcoporum Mettensium* (History of the Bishops of Metz). Finally, after repeated petitions, Paul was permitted to return to his beloved convent, probably accompanying Charles to Italy in 786. At Monte Cassino Paul now wrote his most important work, *De Gestis Langobardorum* (History of the Lombards), which ends with the year 744. The work is remarkable on account of the number of poetic legends of the early Germans it has preserved. Paul was also the author of a number of theological works, and of some hymns and letters still extant. The best edition of his works is to be found in the *Monumenta Germaniæ Historica* (Hanover, 1878-79). Consult: August Potthast, *Bibliotheca Historica Medii Ævi*, vol. ii (2d ed., Berlin, 1896); Auguste Molinier, *Les sources de l'histoire de France*, vol. i (Paris, 1902). There is a German translation of the Lombard History with a serviceable introduction by Reinhard Jacobi in *Geschichtsschreiber der deutschen Vorzeit: Achten Jahrhundert*, vol. iv (2d ed., Leipzig, 1888), and an English translation by W. D. Foulke (Philadelphia, 1907), which has good bibliographical and other explanatory data.

PAULUS HOOK. See JERSEY CITY.

PAULUS OROSIVS. See OROSIVS, PAULUS.

PAUL VERONESE. See VERONESE, PAUL.

PAUMOTA (pā'ū-mō'tā), or **PAUMOTU, ISLANDS.** A group of islands in the South Pacific. See TUAMOTU.

PAUNCEFOTE, pans'fūt, **JULIAN**, first **BARON** (1828-1902). A British diplomat, born of English parents in Munich, Germany, Sept. 13, 1828. He was educated at Marlborough College, in Paris, and in Geneva, and was called to the bar in 1852. Three years afterward he became

private secretary to Sir William Molesworth, British Colonial Minister, and on the death of his chief, the following year, Pauncefote went to Hongkong, where he practiced law successfully, and in 1866 was made Attorney-General of the colony. He was appointed the first Chief Justice of the federated British Leeward Islands in 1874, knighted and made Assistant Undersecretary for the Colonies the same year, and in 1876 was given the corresponding position in the Foreign Office. He was made Permanent Undersecretary of State for Foreign Affairs in 1882, served as British Commissioner to Paris in the Suez Canal negotiations in 1885, and was appointed Minister to the United States in 1889. His title was changed to Ambassador when that office was created in 1893, and he was the first to bear that title in the United States. Queen Victoria made him an Imperial Privy Councilor in 1894. In the Bering Sea, the Venezuelan, and other difficulties between Great Britain and the United States, Pauncefote's large experience, knowledge, and tact in dealing with international affairs were powerful upon the conciliatory side, and his friendliness to the United States was shown in his efforts to have the Clayton-Bulwer Treaty (q.v.) abrogated. (See also HAY-PAUNCEFOTE TREATY.) In recognition of his services as a British delegate to the Peace Conference at The Hague in 1899, he was raised to the peerage as Baron Pauncefote of Preston. For many years before his death, which occurred at Washington, May 26, 1902, he had been dean of the diplomatic corps at that capital.

PAUPERISM (from Lat. *pauper*, poor). The condition of those who are partly or wholly dependent upon private charity or public aid for support. Technically, in law, a pauper is a person supported by the public authorities at the expense of taxpayers. In its broadest meaning the term "pauperism" should not be used synonymously with "poverty," or even with occasional acceptance of relief, but only to designate a state of chronic dependence. Pauperism is possible only in communities where extreme poverty and surplus wealth exist together, and in combination with a prevailing sentiment of pity. In primitive communities, where pity is lacking and the means of subsistence are often inadequate, the hopelessly ill and the aged as well as the irredeemably lazy starve or are put to death. In barbarian societies, where pity is still lacking, although some accumulations of wealth have appeared, weak or deformed children are commonly dispatched, while the aged receive scant consideration.

Chief among the more important causes of destitution in civilization are improvidence, sickness, accident, death of the head of the family, and old age. Charles Booth's investigations of English pauperism have shown that old age is, all in all, the chief cause. Destitution, however, may exist and yet pauperism be averted through a wise administration of private agencies of relief. Destitution at one end of the social scale, abundant means in the hands of kindly disposed but thoughtless givers at the other end, and sentimentality in public administration being given, destitution is rapidly converted into pauperism. In general we may say that improvidence, sickness, or other misfortune, and old age, are the causes of destitution, and that an unwise dealing with destitution is the great cause of pauperism.

History. On account of the simplicity of their economic life, great poverty was rare among the Jews. The care of the poor was left to custom and religion. The gleanings of the olive and vine orchards and of grain fields belonged to the widows and orphans. (Deut. xiv. 28-29; xxiv. 19-22; xxvi. 12-13.) Charity was, however, limited by racial lines, and there was little provision for the alien. Under Christianity there was a great development of charity. Men were to feed the hungry, give the thirsty to drink, clothe the naked, shelter the stranger, care for the sick, visit the prisoner. In the early Church the free gifts of the members were distributed by the bishops and deacons to those who were known by the members to be in need. Within the Church the situation seems to have been excellent.

Greece as early as Pisistratus provided for those wounded in battle. Later those unable to work (*dôuvatoi*), if they possessed property valued at less than about \$60, received from 1 to 2 obols per day (10 obols = 5 cents). As wages were 2 to 3 obols a day, the amount received must have sufficed for support. In Athens poor persons found shelter in houses without doors. There were in many cities unions (*êparoi*) which provided against poverty.

In Rome the donations of food and grain were for political effect, in part at least. Gaius Gracchus supplied Rome with grain at cost. Clodius gave it free to poor citizens, and in 33 B.C. the amount spent for grain was 10,000,000 sesterces, about \$433,000, which rose in 46 A.D. to sevenfold. Cæsar found 301,000 persons receiving grain and limited the number to 150,000, but this figure was exceeded under Augustus. The conditions which entitled men to grain were full citizenship and residence in Rome. Under Aurelius the donations consisted of bread, oil, and meat. From the time of Nerva emperors as well as private citizens gave funds for the education of children, as did Antoninus in honor of his wife, Faustina.

After Constantine great churches replaced the small communions, with the result that the effectiveness of the earlier charity of the Church was impaired. The Church received vast wealth, and great sums were given for the poor. Large institutions arose for widows and children. Rome and other cities were divided into districts in charge of deacons who dispensed alms. In Rome one-fourth of the goods was set apart for the poor. But the old voluntary offerings disappeared and donations came from the Church funds. After the fifth century the decline of charity is obvious, and beggars increased to an enormous extent.

During the Middle Ages the Church taught that almsgiving was a means of obtaining grace, but pauperism became too extensive to be adequately met by private charity. Charlemagne brought pressure on the bishops and lords to support the poor. In 779, a year of special need, he imposed a poor tax and expressly forbade begging. He also made arrangements for caring for widows, orphans, and strangers, but the system went to pieces at his death. The benefactions of the Middle Ages were numerous and varied. There were hospitals of all sorts for the aged sick, the criminal, the homeless, and for pilgrims; free baths; houses for the poor. The charitable orders were also well developed. But no systematic attempt was made to diminish pauperism. There was no discrimi-

nation between worthy and unworthy, the least deserving often receiving most. Great swarms of beggars arose and threatened to overrun Europe. (See MENDICANCY.) In the fifteenth century city authorities begin to take part in the relief of poverty. In 1437 Frankfort had city almoners. Cologne undertook some supervision of the poor in 1450, and Antwerp in 1458 had an Armenmeester. The city council became the guardian of orphans and the insane. But the measures taken to suppress mendicancy were regulative, in effect licensing it, and proved unsatisfactory.

Luther, in his letter to the German nobility, laid the foundations of a new policy. He advocated the control of poor relief by the cities. The relief should be limited to what was absolutely necessary, and should be given only after investigation; the worthy poor should be distinguished from tramps and impostors. In this scheme the idea of almsgiving as a means of salvation disappeared. Augsburg (1522), Strassburg, Breslau (1523), Regensburg, Magdeburg (1524), and other cities began a reorganization of poor relief. The question as to the relative spheres of church and state at once arose and was variously determined. In the main the old parishes formed the poor-relief districts. Efforts were made to gather the various funds into one treasury controlled by deacons (in Hamburg there were three deacons, in Lübeck 12), whose time of service was only one or two years. They were at first elected, but later on appointed, and they rendered yearly accounts. Alms were distributed to the poor at their homes, or occasionally given out at the church. Necessaries of life were sold at low rates. Labor was secured when possible. But the charges were too great for continued success and there were other handicaps. The short term of the deacons made systematic effort impossible; the existence of old orders and institutions caused cross currents, and the plans gradually failed.

The German development begins again after the Thirty Years' War. Edict after edict against begging came to naught, but some progress was made towards fixing the responsibility for support and in the regulation of marriage. By the end of the seventeenth century poorhouses and houses of correction appear. The teaching of Thomasius and of Gallert and the Pietist movement strengthened humane feeling, and in the writings of Garve, Resewitz, Rochow, and others a literature of poor relief appeared. Many patriotic and benefit societies were founded. In Hamburg (1788) the general poorhouse was created. Visitors (180) were appointed to gather information. The poor were given work, various trades were started at the poorhouse, and deficient earnings were supplemented. At first results were favorable. In the first 10 years the number of the poor in institutions sank from 9757 to 4751. In 1801, however, the institution had a deficit of \$15,000, which increased from year to year. In Prussia poor associations (*Armenverbände*) were organized and rules regarding the responsibility for support were adopted. Parishes had to support residents of three years' standing, those without legal residence being cared for out of special or general funds. Schools of industry appeared. Pestalozzi gave an impetus to special institutions for children, and institutions for the deaf and blind were founded. In Gotha

and Weimar children were boarded in families. The schemes adopted were, however, at that time impracticable and many were even demoralizing. Wages below a certain minimum were made good, though it was obvious that employers would lower wages to take advantage of this fact. The period of the wars also had a depressing effect. During the first 30 years of the nineteenth century begging increased. New laws were promulgated in Saxony in 1840 and in Prussia in 1842. The general law of 1870 affecting the German states, with the exception of Bavaria and Alsace-Lorraine, opened the way for the development of the poor relief of the different states according to local conditions. The Elberfeld system (q.v.) has found general adoption. This is in essence a combination of public and private charity, with unpaid visitors, assigned to special districts, who investigate each case, and the treatment is adapted to individual needs. There has likewise been a development of private associations. The Inner Mission (q.v.) has reintroduced the Church care for the poor, and the churches are beginning to organize, as is shown by the proceedings of the Eisenach Conference of 1892. The Catholic church has also been active, this church in general opposing poor relief by the state or at most merely admitting the right of the state to supplement private efforts. Germany has taken steps to do away with pauperism by the introduction also of compulsory insurance and old-age pensions (q.v.).

In Catholic countries the state has never assumed the leading rôle in poor relief. At Ypres in 1525 reform measures were introduced which raised a storm of religious opposition and were never fully carried out, although the Sorbonne ratified them. The Council of Trent took the old attitude, but in spite of this some princes attempted the supervision of hospitals as within their executive rights. There was, however, a great development of charitable institutions under the church. A Portuguese, Juan de Dio (1556), founded the Brothers of Charity and the modern hospitals, while Vincent de Paul is justly honored for his philanthropy and for the establishment of the Order of Sisters of Charity.

France has been the seat of the greatest development of the charity of the church. The administration of relief has been largely through the church, though some of the funds have been supplied by the state. Francis I ordered each church to care for its poor, the poor relief to be in the hands of the pastors and assistants, the funds to be derived from free-will offerings. In Paris (1544) a general poor office was created with power to levy a tax, and this tax was extended to all communes in 1566, which plan was followed until 1791. Edicts against begging were numerous and the penalties often severe, but to no purpose. Under the influence of Francis de Sales and Vincent de Paul many institutions were founded, and Louis XIV also was noted for his efforts in this direction. To supplement the hospitals, *dépôts de mendicité* were established in 1774, and in 1808 these were extended to each province, but they have since largely disappeared. In these labor was compulsory. In spite of the 2185 hospitals with an income of 38,000,000 francs listed by the *comité de mendicité*, in 1790 pauperism was a live question in France. By the time of the Revolution there was a strong demand for a reform

of the poor-relief system. The constitution of 1791 established the principle of state control and that of 1793 proclaimed that "society owes its unfortunate citizens support by offering work and by maintaining those incapable of providing for themselves." It was proposed to acquire the private institutions. Necker initiated new measures, opening, among other things, workshops in Paris, which only served to attract the poor from the country and thus increased the trouble. During the following years many schemes were inaugurated, but the net result was rather to cripple the old system than to establish anything enduring in its place. The church came again to control, subsidized by the state. The Sisters of Charity regained strength. In 1796 local boards (*bureaux de bienfaisance*) were established, but were not made compulsory. They exist to-day in only about one-third of the communes whose population is less than 500 and in perhaps two-thirds of those with a population of over 1000. Relief given is both at home (*secours à domicile*) and in the institutions. The state has assumed charge of the work for children and for the insane. The Revolution found large numbers of foundling hospitals (q.v.), and these increased until 1834, when restrictions were imposed and, instead of the reception through the tours, bureaux of admission were formed and the care of the children regulated. In 1869 a special department of the government was set aside for this work, and in 1874 extensive regulations relative to the boarding of children in private families were adopted. Since 1895 the law regulating medical care of the poor has made some changes, though effective institutions are lacking. The cost of public charity has greatly increased, but this is largely accounted for by the improved care given the poor rather than by great increase in the number of the dependent.

In Italy the mediæval system is most pronounced. Begging is almost universal, and there is little state control of pauperism. The Law of 1862 (*legge delle opere pie*), modified in 1890, established some state supervision over charitable corporations, but further development has been checked by the political situation. There are numerous institutions and endowed charities with funds aggregating \$4,000,000 or more.

In Austria poor relief is chiefly administered through the communes under the leadership of the priests. The system is known as the *Pfarrarmen Institut* (1782). The funds are obtained largely from private donations, and each commune supports its own poor, though there is no special tax for the purpose. In Lower Austria the Elberfeld system has been introduced since 1893, with some local taxation in case of emergency. Switzerland supports the helpless and provides work for the able-bodied pauper. After the freeing of the serfs Russia turned poor relief over to the local representative assemblies, which impose taxes for this purpose. In Norway and Sweden public charities are administered by the Established church. Belgium has almshouses with compulsory labor. Holland has a system of pauper or labor colonies (q.v.), which has won general favor. There exist also over 4600 associations for poor relief, many orphan asylums, and other institutions. In addition there are large numbers of private organizations and institutions.

Long before the Reformation England had unsuccessfully forbidden begging. No provision was made for the destitute until 1388 (12 Rich. II). In 1536 (27 Hen. VIII) each parish was ordered to care for its poor and provide work for the able-bodied. It soon became necessary to induce the people to give money for this purpose, and at first the bishop was to use "charitable ways and means" to persuade the unwilling donor. In 1563 it was decreed that the persistent refusal to give would bring one before the courts for punishment. A decade later a tax was levied for the poor, and public officials, overseers of the poor (q.v.), were created. In 1601 the famous Law of Elizabeth (43 Eliz., c. 2) was enacted and became the basis of subsequent public poor relief in England and the United States. Emphasis is laid upon the "setting to work" of the able-bodied. The overseers were given power to assess, collect, and distribute the rate, as the tax was called. They cared for and apprenticed orphan children. The unwillingness of any parish to support the poor of other parishes led in time to the development of strict settlement laws (14 Car. II, c. 12). Insistence upon "setting to work" of the able led to the establishment of the workhouse (then called the industrial house). The first one was founded at Bristol in 1697. In 1722 a general Act (9 Geo I, c. 7) authorized workhouses wherever needed. Any pauper refusing to go to the workhouse was denied assistance elsewhere. This gave rise to the distinction made in England and elsewhere between assistance given in an institution, technically called indoor relief, and that given at the residence of the recipient or outside of any public institution, outdoor relief. The introduction of the new institutions naturally gave rise to many abuses, and these, with the general humanitarian sentiment of the eighteenth century, tended towards a reaction. Under Gilbert's Act of 1782 the workhouses were largely given over to the old, the infirm, and to children, others receiving assistance outside of the institutions. Various parishes were allowed to form workhouse unions. By an Act of 1796 outdoor relief was again legalized. The famous Speenhamland Act, adopted in Berkshire in 1795, started the allowance system. A certain minimum of wages was considered necessary, and the difference between this and the amount actually earned was to be supplied by

a thorough investigation (1832-34), made a remarkable report (1833-34) showing a deplorable condition of affairs. Pauperism seemed to be contagious, and in some districts nearly all the able-bodied men were receiving allowances. In 1834 (4 and 5 Wm. IV) radical reforms were introduced. Outdoor relief was gradually withdrawn and limited as far as possible. Able-bodied men were refused assistance outside the workhouse. The population of the workhouses was classified. The sexes were separated and only plain necessities of life were provided. The functions of overseers had already been restricted to the collection of rates, and the distribution of relief had been given to boards of guardians. This arrangement was continued. A central body of commissioners was created, which became in 1847 the Poor Law Board. This body was abolished in 1871 and its powers were lodged in the Local Government Board, which is now the body controlling the general execution of the Poor Law in England and Wales. The results have been satisfactory. New unions were formed. Conditions within the workhouses have improved. Many children have been educated in the special workhouse schools, but there is a growing tendency to send them to the regular parish schools. In many districts children are boarded out in private families. When children are ready to support themselves they are apprenticed to various trades. The workhouses of the first half of the nineteenth century have grown into numerous special institutions for the insane, blind, and deaf and dumb, so that the workhouse of to-day is not the general dumping place of the infirm and unfit.

The amount expended in poor relief in England and Wales, including expenses of administration, was £44,589,726 for the three-year period from 1908-09 to 1910-11—an average of £14,863,242 annually. The figures show a constant tendency towards increasing expenditures for poor relief, the expenditure for the fiscal year 1899-1900 being £11,567,649 and that for 1910-11 £15,023,130. The following table showing the number of paupers in receipt of relief indicates a decrease in the number of indoor paupers since 1910 and of outdoor paupers since 1905. The decline in the former may be due in part to the grant of old-age pensions to persons who were already in receipt of relief by the Act of 1911.

ENGLAND AND WALES

JANUARY	INDOOR		OUTDOOR		INDOOR AND OUTDOOR	Insane	Total relieved
	Adult able-bodied	All others	Adult able-bodied	All others	Total		
1900	38,662	183,085	61,058	147,459	731,161	72,207	803,247
1905	50,757	214,992	81,932	493,681	845,362	83,816	924,630
1910	59,759	239,457	75,109	469,341	843,666	93,076	935,738
1911	58,308	240,569	74,575	424,445	797,897	94,985	891,807
1912	55,247	233,828	71,319	345,651	706,045	96,883	801,881
1913	53,601	230,002		411,525	695,045	99,062	794,227
1914	47,006	224,457		389,314	660,777	100,041	761,578

the state. This was extended by the Act of 1796. The expenditures for the relief of the poor rose from about £2,004,000 in 1775 to £4,267,000 in 1802 and to £7,890,000 by 1818. Such a rapid increase called for investigation. A commission authorized by Parliament, after

England has also witnessed a great development of private charity, of which little mention can be made here. The Friendly Societies (q.v.), the Charity Organization Society, the Salvation Army, and Dr. Barnardo's great work for children deserve mention. Attempts to pre-

vent pauperism have been made in cities by the destruction of slums, the building of tenements, and the opening of parks and playgrounds. Public attention has been directed to the question of old-age pensions (q.v.). The postal savings banks (q.v.) have been successful.

Scotland and Ireland have public relief patterned after that of England. In Scotland no relief is allowed to able-bodied adults. The relief is given by inspectors appointed by the parochial boards, which are under the oversight of the board of supervision.

Public relief of the destitute in the United States is based on the Elizabethan Law of 1601. The public duty to give relief is recognized. How this relief shall be administered is a matter for each State to determine. There is little uniformity. At first the almshouse, or poorhouse, was the only institution for the pauper. This was maintained by the town in New England, the county elsewhere. Many of the larger cities had and still have their own institutions. Here have been intermingled the worthy poor, the sick, insane, feeble-minded, children, mothers with illegitimate children. The nineteenth century witnessed the gradual development of hospitals for the insane, which can now provide for about 75 per cent of the insane who are public charges; of institutions for children in such numbers that there is no longer any excuse for the presence of children in almshouses; of hospitals for the sick; of schools for the deaf and dumb and blind; of schools for the feeble-minded, and, in the last decade, of special institutions for the epileptic. Reforms have usually been initiated by private organizations and then been adopted by the State, which has sometimes subsidized private institutions. There is a growing tendency, however, for the State to own and manage all institutions which shelter public charges. Outdoor relief is administered by township trustees under the County Board of Supervisors (in New England the town is the unit) in rural districts. The large cities usually are independent of the county. Chicago is a notable exception. Many cities grant outdoor relief, but some, such as Philadelphia and New York, do not. Mendicancy and vagrancy are forbidden by laws and ordinances, but these are not always enforced. Little attention has been paid to settlement until recently. Now some States are beginning to make inquiries and to send home those who are not properly dependent on them. In most States there is a public body, known usually as the State Board of Charities, which oversees the working of the charitable institutions of the State. Its members, with the exception of the secretary, who devotes his entire time to the work, are usually unpaid. Recently a few States have established a Board of Control, a smaller body of paid agents, to supervise institutions and sometimes to purchase their supplies. Destitute aliens are a State charge. Immigration of persons likely to become public charges is forbidden by Federal laws.

The United States has witnessed a great development of private beneficence. Most of the churches have funds for the relief of poor members, and there are large charitable institutions under denominational management. The growth since 1870 of the Charity Organization Society has helped to bring order out of the chaos in private relief. One of the chief aims of this society is to coordinate various agencies and

to prevent a duplication of effort. Since 1874 the National Conference of Charities and Correction, composed of philanthropists and workers in charitable and correctional institutions, has held annual meetings for the study of pauperism and allied topics, and its publications are valuable. See CHARITIES AND CORRECTION, NATIONAL CONFERENCE OF.

There are no complete statistics of paupers in the United States. The census of 1890 gave the number of inmates of almshouses as 73,045, and a special report of the Census Bureau of 1906 gives the number at 81,714, Dec. 31, 1903. A bulletin of the Census Bureau published in 1914 gives the number for Jan. 1, 1910, as 84,198. These figures take no account of the much larger number of persons receiving help who are not in institutions and the insane and other defectives who are cared for in public institutions, not to mention those supported by private associations.

No attempt has been made to give any comparative statistics of the extent of pauperism in the different countries. The conditions of relief are so diverse, and the census of paupers is so inadequate, that comparative statements are misleading.

Pauperism has no panacea. With every step in human progress a certain proportion of the population, discouraged or overwhelmed by misfortune through the breaking up of old industrial relations when new ones are established, falls behind in the race. Therefore each age and each nation must attack anew the problem of preventing an inevitable destitution from becoming a hopeless pauperism. Certain fundamental principles, however, have been well established by experience and may thus be summarized:

- 1 Indiscriminate almsgiving, without careful investigation of the situation and needs of the applicant, is a fruitful cause of pauperism instead of a remedy.
- 2 To remove the cause and to bring the individual to self-support, if possible, must be the aim of all efforts.
- 3 To accomplish this does are not sufficient, but carefully worked out plans must be adopted and carried through.
- 4 This necessitates an enduring organization of experts (either private or public) to superintend and execute the chosen methods. If success is to be obtained the various charities must work in cooperation with this central body to prevent imposture and duplication of efforts. (See CHARITY ORGANIZATION SOCIETY.)
- 5 The assistance given must be sufficient, but not enough to tempt the self-supporting workingman to surrender his independence.
- 6 In the words of Malthus, "It is in the highest degree important to the general happiness of the poor that no man shall look to charity as a fund upon which he may confidently depend."
- 7 Beggars should be put in institutions with labor adapted to their abilities.
- 8 Constructive efforts, such as the creation of family pride, assistance in securing work, removal of children from demoralizing surroundings, pay far better than any palliative measures.
- 9 The questions as to the sort of relief, in money or in kind, the agency, whether private or public, the place, whether at home or in institutions, are matters to be determined by local antecedents and local conditions.
- 10 For the physically or mentally feeble there must be furnished good care under decent surroundings, that which constitutes good care naturally vary-

ing from place to place and from time to time. 11. It is recognized as desirable, no matter what system of relief prevails, that there should be voluntary, unpaid coöperators to lessen the danger of officialism. See CHARITIES; MENDICANCY; OLD-AGE PENSIONS; POOR LAWS.

Bibliography. The books and articles treating of pauperism are almost numberless. Reference is made only to a few of the more important sources.

Ancient and Mediæval: Monnier, *Histoire de l'assistance publique* (Paris, 1866); Hirschfeld, *Die Getreideverwaltung in der römischen Kaiserzeit* (Göttingen, 1869); Uhlhorn, *Die christliche Liebesthätigkeit in der alten Kirche* (Stuttgart, 1880; Eng. trans., Edinburgh, 1883); Moreau-Christophe, *Du problème de la misère et sa solution chez les peuples anciens et modernes* (Paris, 1881); Ratzinger, *Geschichte der kirchlichen Armenpflege* (Freiburg, 1884), written from a Catholic standpoint; Uhlhorn, *Die christliche Liebesthätigkeit im Mittelalter* (Stuttgart, 1884); id., *Die christliche Liebesthätigkeit seit der Reformation* (2d ed., ib., 1895).

Modern Europe: Emminghaus, *Das Armenwesen und die Armengesetzgebung in den europäischen Staaten* (Berlin, 1870; Eng. trans., London, 1873); Rocholl, *System des deutschen Armenpflegerechts* (Berlin, 1873); Reitenstein, *Die Armengesetzgebung Frankreichs* (Leipzig, 1881); Du Camp, *La charité privée à Paris* (Paris, 1886); Böhmert, *Des Armenwesens in 77 deutschen Städten* (Dresden, 1886); Hubert-Valeroux, *La charité avant et depuis 1789* (Paris, 1890); Bodio, *Atti della commissione reale per l'inchiesta sulle opere pie* (Rome, 1895).

England: *Extracts from the Information Received by his Majesty's Commissioners as to the Administration and Operation of the Poor Laws* (London, 1833); Nicholls, *History of the English Poor Law* (ib., 1854; vol. iii by Mackay, ib., 1899); Ribton-Turner, *History of Vagrants and Vagrancy* (ib., 1887); William Booth, *In Darkest England and the Way Out* (New York, 1890); Charles Booth, *Life and Labor of the People* (10 vols., London, 1891-1903, a monumental work, dealing chiefly with conditions in the East End of London); id., *Pauperism and the Endowment of Old Age* (ib., 1892); id., *The Aged Poor in England and Wales* (ib., 1894); Robert Hunter, *Poverty* (New York, 1904); McCarthy, *The Causes of Poverty* (London, 1908); B. S. Rowntree, *Poverty: A Study of Town Life* (new ed., New York, 1910); S. and B. Webb, *The Prevention of Destitution* (ib., 1912); Ashby, *One Hundred Years of Poor Law Administration in a Warwickshire Village* (Oxford, 1912).

United States: *Report of the Special Committee on Outdoor Alms of the Town of Hartford* (Hartford, 1891). This account of American conditions is unique in the American literature of the subject and ranks in value with the *Report of the Poor Law Commission of 1833-34*. Consult also: National Conference of Charities and Correction, *Annual Reports* (Boston, 1874 et seq.); Brace, *The Dangerous Classes of New York* (New York, 1880); C. R. Henderson and others, *Modern Methods in Charity* (ib., 1904); E. T. Devine, *Principles of Relief* (ib., 1904); E. W. Capen, *Historical Development of the Poor Laws of Connecticut* (ib., 1905); Muensterberg, *Amerikanisches Armenwesen* (Leipzig,

1906); E. T. Devine, *Misery and its Causes* (New York, 1909); State of Massachusetts, *Report of the Commission on Old Age Pensions* (Boston, 1910); R. L. Dugdale, *The Jukes: A Study in Crime, Pauperism, Disease, and Heredity* (4th ed., ib., 1910); S. G. Smith, *Social Pathology* (New York, 1911); Rowntree and Lasker, *Unemployment: A Social Study* (ib., 1911); Heffner, *History of Poor Relief in Pennsylvania, 1682-1913* (Cleona, Pa., 1913); Census of 1890 and special report of Bureau of Census, *Paupers in Almshouses, 1904* (Washington, 1906); also reports of various State conferences of charities.

General: Conrad, *Handwörterbuch der Staatswissenschaften* (Jena, 1909-12), articles under title "Armenwesen." The subjects treated are: Introduction; History of Public Poor Relief; Poor Laws of Various Countries; The Care of the Poor; Poor Rates; Statistics of Pauperism. The articles here given form by all means the best and most complete study of the subject for the purposes of the general reader.

PAUR, pour, EMIL (1855-). An Austro-American pianist and conductor, born at Czernowitz. After preliminary instruction under his father he became a student at the Vienna Conservatory and subsequently held many important appointments. In 1876 he was kapellmeister at Cassel and in 1880 principal court kapellmeister and conductor of the Mannheim subscription concerts. He was director at the Leipzig Stadt Theatre in 1891 and two years later was called to Boston as the successor of Nikisch of the Boston Symphony Orchestra. He became conductor of the New York Philharmonic Society concerts in 1898 and the following year succeeded Dvořák in the directorship of the National Conservatory. He conducted at the Metropolitan Opera House, New York (1899-1900). In 1903 he conducted at the Royal Opera in Madrid and from 1904 to 1910 was conductor of the Pittsburgh Symphony Orchestra. When Muck (q.v.) went to Boston in 1912 Paur succeeded him as conductor at the Royal Opera in Berlin. He is the composer of a Symphony in A, *In der Natur*.

PAUROP'ODA (Neo-Lat. nom. pl., from Gk. *παῦρος*, *pauros*, little, small + *πούς*, *pous*, foot). A small group of arthropods allied to the thousand legs (Diplopoda). The few species known are minute, the body behind the head composed of 12 segments, which on the back are represented by six plates. They differ from the Diplopoda in having but a single pair of legs to a segment. The order is represented by *Pauropus lubbockii* in the eastern United States and Chile and by a flattened broad form, *Eurypauropus*, found in the United States and Europe. The species are cosmopolitan and represent an ancient type. Consult Kenyon, "Morphology and Classification of the Pauropoda," in *Tufts College Studies*, No. 4 (Somerville, Mass., 1895).

PAUSA'NIAS (Lat., from Gk. *Παυσανίας*) (?-c.469 B.C.). A son of Cleombrotus and Regent of Sparta as guardian of his cousin, Plistarchus, the son of Leonidas. He commanded the Greeks

PAUROPUS LUBBOCKII.
a, front view of head.

in the battle of Plataea (479 B.C.), in which the Persian army under Mardonius was overwhelmed, and 11 days later, marching to Thebes, demanded of that city the surrender of all who had been traitors to the Greek cause. After a siege of 20 days the Thebans yielded. In 477 B.C. there was put under his command a fleet of the confederate Greeks, wherewith to drive the Persians from the islands and coast towns, and with this he took Cyprus and Byzantium. Elated by these victories and puffed up with pride and ambition, he entered into secret negotiations with the Persians, with the purpose of becoming ruler, subject to the Persian monarch, of the whole of Greece. Meanwhile he treated the allies as though he were their lord and sovereign, adopted Persian dress and manners, protected his person with a bodyguard of Persians and Egyptians, and introduced into his household habits of Oriental luxury. Being recalled by the authorities at Sparta, he was acquitted on the main charge of treason, and again returned to the Hellespont to renew his intrigues with the Persians. He was a second time summoned home and arraigned, but was a second time acquitted. He now, while still continuing his negotiations with Xerxes, began also to intrigue with the Helots, promising them freedom and citizenship if they would rise and overthrow the government. At last he was betrayed by one Argilius, whom he had commissioned to carry a letter to the Persians. Argilius, noticing that no one of those previously sent on a similar errand had ever returned, opened the letter, found directions therein for his own death, and laid the matter before the ephors. Pausanias, finding his plot discovered and himself entrapped, took refuge in the temple of Athene Chalciæcus. Hereupon the people blocked up the entrance with a pile of stones, the first stone being laid by his aged mother, and left him to die of hunger and exposure. This was about 469 B.C. Consult: Herodotus, ix, 10-88; Cornelius Nepos, *Pausanias*; and the histories of Greece by Grote, Curtius, Abbott, Holm, Beloch, and Meyer.

PAUSANIAS. A Greek traveler and geographer, author of *Ἑλλάδος Περιήγησις, Hellados Periêgêsis* (Guidebook to Greece). Of his early life little is known. He was probably a native of Lydia in Asia Minor, and was certainly at work on his book as late as 175 A.D., though the earlier part seems to have been published some years before. His work, in 10 books, is a detailed description of what seemed to him the most important places and monuments in Greece, arranged by districts and in much of the work described in a most systematic fashion. His interest is largely religious, and so, though other buildings are mentioned, the chief space is devoted to temples and lesser shrines, often with interesting and curious details concerning local traditions and ceremonies. In general he pays little attention to recent art or buildings, reserving his admiration for the great works of the fifth and fourth centuries B.C. The dry details of topography are relieved by historical digressions, often of no great accuracy, anecdotes, and legends. The style is dry and often obscure and the manuscripts are not infrequently defective. In spite of its undoubted weaknesses the book is an invaluable source not merely for the topography and monuments, but for the local cults, and its value increases with new exploration. For his history Pausanias

of course depended on his predecessors, and for traditions and descriptions he seems to have used earlier material; but there is no good reason to doubt that his work represents personal travel and investigation, and its general accuracy is confirmed by recent discoveries. There are a number of early editions of Pausanias, but the best complete texts are those edited by J. H. C. Schubert (Leipzig, 1853-54; often reprinted), and an edition with critical and explanatory notes by Hitzig and Blümner (3 vols., Leipzig, 1896-1910); the fullest commentary is by J. G. Frazer, *Pausanias' Description of Greece*, translated with commentary (6 vols., London, 1898; new ed., 1913); valuable for Athens are Jahn and Michaelis, *Arx Athenarum a Pausania Descripta* (3d ed., Bonn, 1901); Harrison and Verrall, *Mythology and Monuments of Ancient Athens* (London, 1890); Mitchell Carroll, *The Attica of Pausanias* (Boston, 1907). For the criticism of Pausanias, consult: Kalkmann, *Pausanias der Perieget* (Berlin, 1886); Wilhelm Gurlitt, *Pausanias* (Graz, 1890); Rudolf Heberdey, *Die Reisen des Pausanias in Griechenland* (Vienna, 1894); J. G. Frazer, *Pausanias and Other Greek Sketches* (London, 1900); id., the introduction to his commentary and translation (see above); H. Ebeling, "Pausanias as an Historian," in the *Classical Weekly*, vol. vii (New York, 1914).

PAUSIAS, παῦσι-ας (Lat., from Gk. Πάσιος). A Greek painter of the first half of the fourth century B.C., a pupil of Pamphilus and a contemporary, if not a fellow student, of Apelles. He was a great decorative artist, especially in encaustic, and was reputed the first to paint ceilings, setting within garlands and wreaths small genre pictures, especially of children. His famous painting of Glycera, a flower girl of his native city, Sicyon, and probably his mistress, showing her with a garland in her hair, or a copy, was sold to Lucullus for two talents. His skill in foreshortening made his work prized in Rome, where a black bull at the altar, head to the front, and with such clever perspective that the length was easily guessed, was one of the great pictures in the portico of Pompey's temple. See Pliny, *Historia Naturalis*, xxxv, 127.

PAUW, pou, CORNELIS VAN (1739-99). A Dutch author. He was born at Amsterdam and educated at Göttingen. He joined the Order of Franciscans and became canon of Xanten in the Duchy of Cleves; was afterward appointed reader to Frederick II of Prussia. He declined the place of an academician of Berlin and a bishopric at Breslau. He published *Recherches philosophiques sur les Américains* (1768-70; enlarged editions, 1770, 1774); *Recherches philosophiques sur les Egyptiens et les Chinois* (1774); *Recherches philosophiques sur les Grecs* (1778). These works were translated into English (Rochdale, 1806; London, 1795, 1793 respectively). They contain curious information, but many unproved assertions made in a dogmatic spirit. A complete edition of his works appeared in Paris in 1795.

PAUWELS, pou'êls, FERDINAND (1830-1904). A Belgian historical painter. He was born at Eeckeren, near Antwerp, April 13, 1830, and studied at the Academy of Antwerp, principally under Wappers. He gained the Roman prize in 1852 and remained four years at Rome. Upon his return to Antwerp he achieved fame with his "Widow of Jacob van Artevelde"

(1857, Brussels Museum) and "Banished by Alva" (1861). From 1862 to 1872 he was professor in the Art School at Weimar and painted, besides other pictures, the "Reception by Louis XIV of a Deputation from the Doge of Genoa" (1864, Maximilianeum, Munich) and several mural paintings in the Wartburg illustrating the history of Luther. He returned to Antwerp in 1872 and finished the historical cycle of wall paintings by Groux in the Cloth Hall of Ypres. In 1876 he became professor at the Academy of Dresden. His later works include "Count Philip of Alsace Visiting a Hospital at Ypres" (1877, Dresden Gallery) and "Admonition" (Leipzig Museum). The paintings of Pauwels are intelligently composed, with great archaeological exactness, his figures are well characterized and the color is good, but his work lacks depth and feeling.

PAVANE, pāv'an or pāv'an' (It. *pavana*, probably a variant of *pavone*, *paonc*, peacock; so called from the stately character of the dance; commonly derived, however, from It. *Padvana*, *Padovana*, Paduan, from *Padova*, Padua, as being supposed to be the place where the dance originated). An ancient Italian dance which spread from that country into Spain, thence to France, and eventually to England and Scotland. It was most popular during the sixteenth century, and was especially so in Spain and at the court of James V of Scotland. It was a solemn, stately dance, generally accompanied by a song. The music was always written in even time and the steps were simple and slow, the performers alternately advancing and retreating. There were various modifications of the pavane, the most important being the Spanish, which introduced a number of elaborate figures. During the seventeenth century the pavane played a most important rôle in the dance suites of the German composers.

PAVEMENT (OF. *pavement*, *paviment*, Fr. *pavement*, from Lat. *pavimentum*, pavement, beaten floor, from *pavire*, to beat, Gk. *πάειν*, *paiein*, to beat, Skt. *pavi*, thunderbolt). This term, in its broader sense, includes any firm, hard covering for areas subjected to the wear and tear of human feet or of hoofs and wheels, designed to keep the feet or wheels from the ground or earth and to present a more or less dry, durable, and smooth surface. Under this definition would be included the paved floors of cathedrals and other public buildings often of an ornamental character (see **TILES**), as well as the surfaces of courtyards, walks, streets, and highways on which stones or other durable materials are placed. In the modern and more restricted sense pavements are generally limited to the wearing surface of that portion of improved streets lying between the curbs, thus excluding the sidewalks.

The early history of pavements is involved in obscurity. Strabo says Babylon was paved 2000 years B.C., and Livy relates that about 170 B.C. Rome was paved from the ox market to the temple of Venus. Before the Christian era the Romans had learned to construct solid and durable pavements, composed of several layers of stone, mortar, and cement, the upper surface being quite smooth. Portions of these early pavements are said to have been in use within comparatively recent times. Excavations at Pompeii reveal some of the old Roman streets just as they appeared when the city was destroyed 79 A.D. The stone blocks were large,

many-sided, with their vertical edges carefully fitted, the whole resting on a solid foundation composed of several layers. The material used was lava. It is said that the streets of Cordova in Spain were both paved and lighted as early as 950 A.D., under the caliph Abd-er-rahman III, but most mediæval cities were unpaved until about the twelfth century, and nearly all pave-

TYPICAL STREET PAVEMENTS

ments from that time on until well into the nineteenth century were of rude construction, cobblestone being a common material.

Paris first had pavements, it is believed, about 1184, when its population was estimated at 200,000. In 1698 the pavements of Paris were described as being "of square stones of about 8 or 10 inches thick; that is, as deep in the ground as they are broad on top." Tillson says that the English Parliament ordered the London Strand paved in the fourteenth century, but adds: "It is said that the first regular pavements were laid in 1533, when the city had a population of 150,000. Holborn had some pavements in 1417. Square granite blocks were introduced by acts of Parliament for Westminster in 1761 and for London generally in 1766." In the United States cobblestone pavements were laid as early as 1650 in both Boston and New York.

During the second quarter of the nineteenth century the cities of both Europe and America began to look about for better pavements and to

experiment with stone and wood blocks and (in Europe) with asphalt. From 1850 to 1875 bricks were tried in America. During the period from 1875 to 1900, and more particularly from 1890 to 1900, the theory and practice of street paving were put on a more satisfactory basis than ever before, and thousands of miles of new pavements were laid. Since 1900 the development has continued, and the mileage has been greatly increased.

Asphalt was first used in Paris in 1838, but not on a large scale until 1854. It was introduced in London in 1869. In both these cities the material was rock asphalt. What is believed to have been the first asphalt pavement in the United States was laid in Newark, N. J., in 1870 by E. J. de Smedt. In 1871 some asphalt was laid in New York and a little later in Philadelphia. The material in each of these three cases was Trinidad asphalt. In 1876-77 both rock and Trinidad asphalt were laid in Washington. The good results obtained in that city led to the rapid introduction of asphalt there and elsewhere, but comparatively little rock asphalt has been laid in America.

Brick was used to pave roads in Holland as early as the seventeenth century and has been used extensively for both roads and city streets since. Brick pavements are said to have been used in Japan for more than 100 years. The first brick pavement on a roadway in the United States was laid at Charleston, W. Va., in 1870, and in 1873 the city adopted the system for certain streets. This example was followed by many Central Western cities, but Philadelphia was the first large city to make use of this material, laying some brick roadway pavement in 1887. Since 1900 the increase in the use of brick for pavements both on city streets and country roads has been remarkable, owing very largely to the efforts of the National Association of Paving Brick Manufacturers to better their output and to standardize the laying of brick pavements by the best methods.

Wood blocks were laid in New York as early as 1835-36, and in 1839 wood pavements were already in use in both Philadelphia and Boston, being mentioned in a report made to the Franklin Institute (Philadelphia) by a committee on paving materials. London laid its first wooden pavement in 1839, Glasgow in 1841, Paris much later.

Stone blocks of the modern type, of 3 × 9 inches, granite, with mortar joints, were laid on Blackfriars' Bridge, London, in 1840. Glasgow laid granite blocks in 1841. A concrete foundation was used in London, the first in that city, in 1872, and tar and gravel joints were employed in both London and Liverpool about the same time, although used in Manchester, England, prior to 1869. Prior to 1849 scarcely any pavements but cobblestone were used in New York. About 1850 Belgian blocks were introduced. Granite blocks similar to those now used were introduced in New York about 1876, succeeding some much larger blocks, known as the Guidet patent. Concrete foundations for stone pavements were not used regularly in New York until 1888. Large stone blocks were used in St. Louis as early as 1818, being from 3 to 12 inches thick, 6 to 14 inches long, and 6 to 10 inches deep, set on 6 inches of sand. In 1842 stone blocks of about the present size and shape were used in St. Louis. There has been a recent tendency to reduce the size of stone pav-

ing blocks. Good practice now calls for a block 6 to 10 inches long, 3½ to 4½ inches wide and 4¾ to 5¼ inches deep, which is much nearer the size of a paving brick than the old blocks. Since 1912 there has been an attempt to introduce in the United States the 3-inch and 4-inch stone cube pavement, which has been used in Germany for a number of years under the name of Kleinpflaster pavement. These small blocks are generally made by a mechanical cutting tool and are known by the trade name of Durax blocks. Several experimental pavements of this type have been laid in American cities.

Concrete was probably first used for a pavement surface in Inverness, Scotland, about 1865. The first concrete pavement in America was laid in Bellefontaine, Ohio, in 1884. Since 1900 concrete has been very extensively used for street pavements in the cities of the Central West, and since 1910 many miles of country roads have been paved with concrete. The ordinary thickness of these pavements is 6 to 8 inches at the centre and 5 to 6 inches at the edges.

In America the pavements now being laid are principally asphalt, brick, stone, wood, and concrete.

Rock asphalt is used to some extent in London, Paris, and other European cities, and stone blocks are common. Brick does not appear to have gained the footing in Europe that it has in America. There is still another sort of improved street surface which has been very common on roads and on streets of light traffic throughout the United States, Canada, Great Britain, and at least the western part of continental Europe, viz., the compacted broken stone, known as macadam or telford.

Formerly these pavements were what is known as water bound, i.e., the fragments of stone bonded together by a natural cement of dust and moisture; but such pavements have been unable to withstand the traffic of motor vehicles and many of them have either been given a bituminous surface by the application of asphalt or tar oils or have been entirely discarded as street pavements. A bituminous macadam pavement is one of compact broken stone in which the binding material is a bituminous cement of tar or asphalt. The binder may be applied during the rolling process by some form of sprinkling or spraying apparatus, which is known as the penetration method, or by mixing the mineral aggregates and bitumen together, as in sheet asphalt pavements, and then rolling, which is known as the mixing method. A bituminous macadam pavement constructed by the mixing method is generally termed a bituminous concrete pavement and in all essentials is merely a less expensive substitute for sheet asphalt. See ROADS.

Foundations are to pavements what floors are to carpets, or, conversely, the visible parts of pavements are but the wearing surfaces of streets. Failure to recognize the importance of good foundations has been the bane of most American and many foreign pavements. If the foundation yields, through deficient drainage or bad material and workmanship, the destruction of the pavement follows. In some soils natural drainage is ample. Where it is not, either a drain in the centre or at one or both sides of the street is required to remove the subsoil water. These drains may be of stone, tile, or sewer pipe, according to the relative cheapness of

the several materials in the locality concerned and the character of the drainage work. Drainage provided, and the surface on which the pavement is to be laid shaped and compacted, the foundation is next put in place. For serviceability nothing surpasses concrete as a foundation. The chief argument against it is its cost, which may range from 50 cents per square yard upward. The thickness of the concrete should rarely be less than 6 inches and may run as high as 10 inches. Sometimes broken stone alone is used for foundation, and again stone, brick, or wood is laid directly on sand.

If the traffic is not heavy, sand, gravel, or broken stone may sometimes be used with a fair degree of success, particularly if the earth beneath is well compacted and thoroughly drained. Asphalt should always have a concrete foundation, except where laid on top of an existing pavement of some other material which will form a good bed. The finished surface of the foundation should be brought to such a curve or crown, crosswise of the street, as will shed the rainfall to the gutters. Crowns vary from $\frac{1}{4}$ to $\frac{3}{4}$ inch to each foot of width, according chiefly to the kind of pavement, the smooth types such as asphalt requiring the least. The best practice is to use as small a crown as is consistent with good drainage. The crown should increase with the width of the street, but not necessarily in direct proportion.

Cushion coats, composed of 1 to 2 inches of sand, are generally placed on concrete foundations for all materials save asphalt, and also on brick laid flatwise for foundations. They allow the separate blocks or bricks to be brought to a firm bed by ramming or rolling. They also provide for uneven depths in blocks or bricks, thus aiding in bringing the finished pavement to a true surface.

Fillers are employed to close the joints between blocks and bricks. They are often of some waterproof cement, thus rendering the pavement impervious as well as binding it together. Where bituminous in character, like asphalt, coal tar, or the two combined, they also yield somewhat to contraction and expansion, without permanent rupture, as is the case with the Portland cement and other burnt stone fillers. *Portland cement filler* is a grout composed of one part cement and one or perhaps two parts fine sand, mixed with sufficient water to cause it to run easily, thus filling the interstices. *Bituminous* cements are many and variable, but may be classed as coal-tar pitch and asphalt. Residuuum oil (obtained in the refining of petroleum) is generally, but not always, used with asphalt cements. (See ASPHALT.) Coal-tar pitch alone becomes brittle and cracks or breaks in winter, while in summer it becomes hot and flows. It is designated commercially by the degree of hardness to which it has been distilled. New York City practice is to use a bituminous filler almost entirely for granite-block and wood-block pavements. It is generally optional whether this filler be of asphalt or of tar. While the common practice is first to sweep sand and pebbles into the joints and then pour in the hot bituminous filler, the most recent method is to mix the sand and pebbles with the heated bitumen to form a mastic. With the close ($\frac{3}{8}$ -inch) joints required in New York City granite-block pavements the latter method has been the more satisfactory. All the bituminous cements are poured hot

Sand alone is also used as a filler, but not where imperviousness is desired.

Ramming is employed on stone, and rolling on wood and brick, pavements to bring the blocks or bricks to a firm bed and even surface. Rolling with steam or other rollers is a necessity with sheet-asphalt and bituminous pavements and is sometimes done with concrete.

Choice of Paving Materials depends on a variety of factors, such as serviceability, durability, cost of construction, repairs, and maintenance, ease of cleaning, noiselessness, and other sanitary or related qualities. Under serviceability the main factors are a minimum resistance to traction and a good foothold for horses, or absence of slipperiness. Asphalt fulfills the first of these conditions most admirably, and probably brick comes next. Asphalt is slippery, both in wet weather and on heavy grades. Brick is less slippery. Newly laid wood gives a smooth pavement, but it is liable to wear unevenly and to be slippery in wet weather. For durability or long-wearing powers the best stone blocks cannot be excelled, and under heavy traffic they are very serviceable, although offering more resistance to traction than several other materials. In first cost, asphalt, wood, and the best stone blocks rank high, but this is largely offset by their durability and low cost of repairs. Brick pavements are very cheap in some localities, and if placed on good foundations they are sufficiently durable. The growing scarcity of lumber suitable for the purpose and the cost of properly treating the blocks render wood expensive, but it is growing in favor. For ease of cleaning nothing can surpass asphalt, and it gives rise to less noise than either stone blocks or brick. Brick is also easily cleaned and far quieter than stone blocks. The latter are not only noisy, but also hard to clean, and unpleasant to ride over, on account of their roughness. However, there has recently been a great improvement in the methods of making stone-block, or particularly granite-block, pavements. By the selection of proper materials, more accurately shaped blocks, permitting their being laid with close joints, and careful attention to other details of construction, granite-block pavements are now made which are almost as smooth and but little more noisy than brick pavements. The smoothness of asphalt and brick, and the quickness with which their surfaces dry after a rain or a sprinkling, make them great dust spreaders, but the ease and thoroughness with which they may be cleaned render an avoidance of this nuisance comparatively easy. The large joints of the old stone-block pavements collect and retain dirt, but, as it is next to impossible to clean all of it from between the stones, it dries and spreads when subjected to the sun and wind.

Cost of pavements varies widely with local conditions, particularly the depth and character of the foundations, the kind and quality of the wearing surfaces, the inclusion (or absence) in the contract of maintenance guarantees, and the freight rates. The variations are even greater when the cost of grading is included. For comparative purposes the cost of grading, draining, and curbing should be omitted; and the maintenance guarantees, if any, should be described. In fact, without full details relating to the various factors involved, comparative figures of cost are often worse than useless. The *life* of pavements, or the period for which they may be

used without renewing the wearing surface, is given by Tillson as follows: granite blocks, 20 to 25 years; Belgian blocks, 20 years; asphalt and cobble, each 18 years; brick, 15 years; wood, 10 to 15 years; bituminous concrete, 8 to 10 years; macadam, 8 years.

Tools for paving work include hammers, rammers, tamping irons, crowbars, sand and gravel screens, and brooms, besides special asphalt tools and machinery and a variety of tools and machines common to road and other work, such as rollers and concrete and gravel mixers. The graders, scrapers, and other apparatus used in preparing the earth subgrade, and also the rollers used to compact the natural earth and various classes of paving material, will be described under ROAD and STREET MACHINERY. Concrete mixers are described under CONCRETE. Pavers' hammers have a head at one end for pounding the blocks, and a sort of combination chisel and scoop at the other, to facilitate the preparation of the sand cushion and to pry out or loosen single blocks in the setting. Different-shaped hammers are used for cobble than for squared stones, and still different ones for brick. Rammers also vary in shape and weight, according to the character of the blocks for which they are designed. For stone the weights are 40 to 45 pounds; for brick, 25 to 30 pounds; for earth, about 20 pounds. Several shapes of tamping irons are used for street asphalt, to facilitate work along curbstones and to meet other special needs. These rammers have cast-iron heads and wooden handles. The smoothing irons are of the same materials, but are slightly convex to the pavement and are mounted on handles curved at the lower end. Both the tamping and smoothing irons are heated in fire boxes mounted on wheels. Screens for sand and gravel are of the familiar type used by masons, consisting of wire meshes of the desired size mounted in wooden frames. The brooms used for brushing sand and gravel into joints are short and stiff, of rattan, wood fibres, or wire. Various kinds of special apparatus are used in repairing asphalt pavements, the most important of which is a surface heater, a self-propelling machine which is provided with a furnace for turning a blast of very hot air against the pavement surface. An inch or 1½ inches of the old surface, softened by the heat, is then removed and replaced by a new mixture and rolled.

Asphalt Pavements are divided into sheet and block. Sheet asphalt consists of a binder and a wearing surface, the binder serving to unite the foundation and the wearing surface. The binder is composed of small pieces of broken stone, united with asphaltic cement. The mixture is spread on the foundation in a layer sufficiently deep to give the requisite thickness after having been rolled. A final thickness of 1 inch is considered ample by some, but 1½ and even 2 inches is not uncommon. The wearing surface is composed of sand, carbonate of lime (powdered limestone), or Portland cement, and asphaltic cement, mixed hot in varying proportions. The object is to use enough powdered limestone or cement to fill the voids in the sand as completely as possible and enough asphaltic cement to bind the whole together. It is also desired to make the pavement impervious to water. The consensus of opinion is that the wearing surface should contain 9 to 12 per cent of bitumen and have a final thickness of 1½ or 2 inches. It should be spread on the binder while

the mixture is hot, say at a temperature of 250° F. The spreading is effected by men with rakes, who are followed by other men with hand rollers or very small steam rollers. Next hydraulic cement is scattered over the surface. After this comes first a 5-ton and then a 10-ton steam

TOOLS USED IN STREET PAVING.

roller. Thus three rollers are used in succession, the lighter ones first, in order to prevent distortion of the asphalt while soft. Generally the asphalt is laid clear up to each curb, special care being taken with the gutters, but sometimes brick or stone is used in place of asphalt in the gutters. The need of special precautions here is the danger from the water that gravitates to the gutters. Cracks are liable to occur in sheet asphalt subjected to wide variations in temperature. Most of the asphalt pavements laid in America have been composed of Trinidad sheet asphalt, but in recent years both the Bermudez and Alcatraz products have been employed. Since the development of the Californian, Mexican, and other Western oil deposits, the petroleum products from which have asphalt bases, there has been much keener competition in the asphalt industry, and the by-products of these oil refineries have become very large factors in asphalt paving. The best practice is to use any asphalt which fulfills certain chemical and physical tests, irrespective of whether it is a so-called natural asphalt such as Trinidad or a residual from the refinement of petroleum. See ASPHALT.

Asphalt Plants, used to prepare the material for laying sheet-asphalt pavements, include melting kettles, sand heaters, mixers, and various accessories. The asphalt arrives at the plant in barrels or steel drums. These are cut away, and the asphalt and the residuum oil or other flux are heated and thoroughly mixed in

the kettles. The mixing may be effected by revolving paddles, or by pumping in air at the bottom of the kettles. The sand is dried and heated in jacketed revolving cylinders, fitted with angle bars to keep the sand well agitated. The drum is set at a slight angle, so that the sand will find its way out. It falls into elevators, which take it to a bin on or above the mixing platform. In case pulverized limestone cannot be had in the vicinity of the plant a limestone-grinding mill is provided, or Portland cement may be used instead. All the ingredients being ready, the asphaltic cement, sand, and limestone are admitted to the mixer. This is an iron box, with a capacity of 8 to 16 cubic feet. Two parallel revolving shafts, each fitted with steel blades and revolving in opposite directions, are placed in the bottom of the box and effect a thorough mixing of the several materials. When mixed, the finished paving material is dumped from the mixer into a cart or wagon and hauled to the street.

Rock Asphalt Pavements are composed of crushed limestone or sandstone, naturally impregnated with bitumen. If the natural product does not have the desired proportion of bituminous matter, this is rectified by mixing a richer or poorer rock with the first. The mixture is powdered, sifted, then kept heated for two hours at 300° F. to 325° F., after which it is carted to and spread upon the street. After a light rolling, followed by hand tamping, the surface is covered lightly with hydraulic cement and rolled with a steam roller. The European rock-asphalt pavements are all made from bituminous limestone, but in America both sandstone and limestone bituminous rock are used, sometimes mixed together. Little trouble from cracking arises with the rock asphalts; they are generally considered more durable and more slippery than the artificial asphalt mixtures. In Paris some of the asphalt pavements are prepared by adding enough bitumen to the rock asphalt to bring the total bitumen up to 15 or 18 per cent. The mixture is heated to such a consistency that it can be spread or floated into a layer about 1½ inches deep. It is not rolled. Other asphalt pavements in Paris are compressed.

Block Asphalt is formed by mixing crushed trap rock and asphaltic cement at a temperature of some 300° F., and molding the mixture in machines under a pressure of 120 tons to each block. The blocks measure 5 × 12 inches on the street surface and are either 2 or 3 inches deep. They are laid much like brick, except that no joint filler is required. It is claimed for asphalt blocks that they are made of a uniform composition and at a uniform temperature, always under cover, thus yielding a product of constant quality; also that they are available for use in small places where the erection of a plant for the preparation of sheet asphalt would be out of the question.

Brick Pavements are composed of tough, hard, nonabsorbent brick, designed to withstand the hammer-like blows and abrasive action of hoofs and wheels and to resist the action of water and frost. In size, shape, and general appearance they resemble ordinary building brick, but they are made and burned with more care. (See BRICK.) Where feasible, brick should have a concrete foundation. On the latter a 1-inch or a 2-inch cushion of sand is laid. The bricks are set edgewise on the sand, their

lengths running across the street and joints being broken. At street intersections each quarter of the area is laid diagonally, so that the length of the brick will be at right angles to the direction of the traffic when the latter is turning corners. The bricks are rolled to bed them firmly. Such bricks as sink below the surface are replaced with deeper ones. Although the bricks are set in as close contact with each other as is feasible, open spaces remain. Nearly all the fillers described above have been used for brick pavements. Sand is not suitable, as it quickly washes out. There has been great difference of opinion as to the relative merits of Portland-cement grout and the bituminous fillers, but it is now generally conceded that the grout is the better. Both kinds of filler are poured over the surface of the pavement and swept into the joints with brooms. After this has been done the pavement is covered with a thin layer of sand. Expansion joints are sometimes provided, both lengthwise and crosswise the streets, the former at each curb line and the latter at intervals of 25 to 50 feet. They are made by filling a narrow space or spaces between bricks with some form of bituminous cement. The National Association of Paving Brick Manufacturers, which has done the most to promote brick pavements, recommends only cement-grout filler and strongly opposes crosswise expansion joints as detrimental to the pavement.

Wood Pavements are composed of blocks of wood, laid with the grain or fibre perpendicular to the foundation. The rectangular blocks are most commonly 3 × 9 inches × 3½ to 6 inches deep. The round blocks are 4 to 8 inches in diameter and about 6 inches deep. Blocks of hexagonal and other shapes have been tried, but experience has shown that the special forms have no advantage commensurate with their cost. The round and the rectangular blocks are sawed to the desired length from logs or from plank, gang saws sometimes being used. The bark, and in some cases the sapwood, is cut from the round blocks by machinery. The blocks should be treated with creosote or some other wood preservative. Unless this is done, it is questionable whether wood should be used for paving purposes. The round blocks have much space between them to be filled; the rectangular blocks are sometimes laid close together and sometimes with spaces. Various fillers, in semiliquid form, composed of sand and some cementing material (Portland cement, tar, or asphalt), are used to close these spaces. Expansion joints are often but not always inserted at the curb. These are strips of sand or some other material that will compress when the wood blocks expand in wet weather and will expand when the blocks contract in dry weather. Until about 1900 round cedar blocks were more freely used in America than any other wood. In Europe pine, fir, and more recently Australian hard woods, known as karri and jarrah, have been employed. In Chicago round cedar blocks were laid as follows: About 2 inches of sand was spread over the surface to be paved. On this a flooring of 2-inch hemlock plank was laid, supported at the centre and each end by 1 × 8-inch boards, laid flatwise in the sand. The blocks were set on end on the plank. The spaces between the blocks were at least ¾ of an inch, but not more than 1½ inches in size. The joints were filled with clean, screened dry gravel,

thoroughly rammed in, after which the whole pavement was covered with hot coal-tar pitch, and this in turn was covered with $\frac{3}{4}$ of an inch of roofing gravel. At Indianapolis rectangular red cedar blocks were laid in 1894 and 1896, and heartwood Southern yellow pine later on. The first blocks were not treated, but the later ones were creosoted. The blocks were laid on a concrete foundation, with a 1-inch sand cushion, and latterly with expansion joints at the curb. The joints were partially filled with fine sand, after which the pavement was rolled, then covered with hot paving pitch and fine gravel. The cedar blocks were 5 inches, and the pine blocks 4 inches deep. Since 1900 creosoted wood blocks and also wood blocks treated with creosote and resin have been gaining in favor in the United States. In 1906 the growing scarcity of yellow pine led to the use of some of the Southern gumwoods, with promise of satisfaction. The best practice, however, is still to require creosoted yellow pine. Some of the London hardwood pavements have been of blocks $3 \times 9 \times 5$ inches deep, laid close. At the gutters three courses were laid parallel to the curbs, the blocks having been dipped in a boiling mixture of four parts of tar and one part of pitch, and there being a 1-inch sand-filled expansion joint at each curb. The main part of the street was covered with blocks laid crosswise. The filling is effected with boiling tar and pitch, first covering the entire surface, then worked into the joints; after which cement grout is floated over the pavement, then sand thrown over all. Softwood pavements of the same period in London were not less than 6 inches deep, creosoted, and had their joints filled with a grout of blue lias lime and sand.

Stone-Block Pavements are most commonly of granite, some of the harder and tougher sandstones, and trap rock, the latter being the least satisfactory of the three. The lengths and depths are quite variable in different cities, but in the best work the widths range from 3 to 4 or $4\frac{1}{2}$ inches, with a tendency to $3\frac{1}{2}$ inches in American cities. The governing condition of width is the foothold for horses. Depths should be at least one and one-half times the narrow and medium widths, to give a firm setting that will prevent rocking on the base. In American cities common dimensions are as follows: widths, $3\frac{1}{2}$ to $4\frac{1}{2}$ inches; lengths, 6 to 12 inches; depths, 4 to 8 inches. In a number of European cities there is a tendency to square or nearly square blocks, approximating 6 inches on a side, with depths of 6 to 8 inches. Square blocks (or Belgian; see below) are also used in the United States, but not frequently of granite, as is the case abroad. The blocks should be as nearly rectangular and flat as is possible on the tops, sides, and ends. The blocks are generally laid crosswise of the street and diagonally at intersections. A sand cushion is used when the blocks are laid on concrete, as they should be almost invariably, since stone blocks are generally used where the traffic is heavy. The filler most commonly employed for the joints is first gravel, then hot paving cement. Medina sandstone is sometimes laid as close as possible and filled with asphaltic cement or Portland cement. *Belgian blocks*, so named from their use in Belgium, have tops 5 or 6 inches square, bottoms somewhat less, but generally not more than 1 inch smaller each way, and depths of 7 to 8 inches. These blocks have

been extensively used near New York, and trap rock, being plentiful and cheap in that vicinity, has been employed for the purpose. The trap does not break to a true surface readily and is not easily worked, so that it is difficult to get good surfaces with Belgian block of this material. It is very durable, but wears smooth and slippery. Belgian blocks are almost if not quite always laid on a sand or earth base, since one of the objects in their selection is cheapness; their joints are filled with sand. Trap-rock blocks are also got out and laid in oblong form, much like granite and sandstone in general outline, but with far less regular surfaces. Limestone has been used for block pavements, but to a small extent, as it is too soft to be durable.

All blocks should be laid diagonally at street intersections, as is done with brick. The securing and dressing of stone blocks do not differ materially from the quarrying and working of other dimension stone. *Crosswalks* are laid at street intersections. They are composed of two parallel rows of bluestone, granite, or sandstone, according to the locality and the kind of pavement, with a row of blocks between. The cross stones are $1\frac{1}{2}$ to 2 feet wide, 4 to 6 feet long, and 6 to 8 inches thick. In the best modern work they are laid with a keystone at the centre of the street and with diagonal joints each way, at right angles to the direction of the traffic in turning corners.

Cobblestones are seldom used now. Their only merit is low first cost. They are laid with best results on a base of 6 inches of loamy sand, which gives a firm bedding and tends to hold them tightly in place. They are set on end. The stones should be not less than 4 inches nor more than 8 inches in diameter at the head, not under 5 inches nor over 10 inches deep, and only rounded stones should be used.

Marked changes in paving practice since 1900 have been the increasing use of improved granite blocks and of treated rectangular wood blocks, already mentioned, a growing disfavor for all the rough, coarse-jointed pavements, and the rapid extension of bituminous macadam.

Decorative Pavements. In many of the public squares of Europe the pavement has been treated as a subject of decoration, especially upon certain areas reserved wholly for pedestrians, such as terraces and spaces in front of public buildings. Such decorative pavements are usually of marble of two or more colors; the most celebrated example is that of the square of St. Mark's and the Piazzetta. An example of analogous treatment may be seen in the so-called South Court in front of Columbia University in New York. A common and effective device in Mediterranean countries is the use of small pebbles, white, black, and red, closely set to form a simple mosaic pattern in garden walks and terraces. The term "pavement" is also used to designate the stone or marble floors of churches and halls, which are in the Old World often of great magnificence, all the various forms of mosaic being employed in their decoration. Italy leads in this art, and the floors or pavements of the Pantheon and of the churches of San Clemente and St. Paul-beyond-the-Walls at Rome, of St. Mark's at Venice, and of Siena Cathedral, are especially famous. See FLOOR; MOSAIC.

Maintenance. The greatest enemy to good pavements is the frequent street openings so

common and often so necessary where subways for pipes and wires are not provided. (See **SUNWAYS**.) All street openings to gain access to pipes and wires should be under the control of the city department responsible for the maintenance of the pavements. Great care should be taken in refilling all trenches, the dirt being thoroughly tamped to prevent future settlement. In America maintenance for a period of years is sometimes included in contracts for pavements, but chiefly for asphalt. The periods are of varying lengths, but generally 5 to 10 years. Maintenance guarantees amount, of course, to a higher contract price for what on its face is original construction but is really maintenance as well. When the guarantees expire, a contract for maintenance only is sometimes made with the original or a new contractor. See **ASPHALT**; **BRICK**; **CONCRETE**; **QUARRYING**; **ROAD AND STREET MACHINERY**; **ROAD**; **STREET**.

PAVEMENT ANT. See **HOUSE ANT.**

PAVET DE COURTEILLE, pá'vá' de kōōr'-tā'y', ABEL (1821-89). A French Orientalist, born in Paris. He was a grandson of De Sacy and studied under him in the Ecole des Langues Orientales. After four years as instructor in the Ecole des Jeunes, in 1855 he became professor of Turkish in the Collège de France and a member of the Institut. It was in Turkish especially that he made important research. He published: *Conseils de Nabi Efendi à son fils Aboul Khair* (text and translation, 1857); *Histoire de la campagne de Mohacz* (text and translation from the Turkish of Kemal Pacha Zadeh, 1859); Maçoudé's *Les prairies d'or* (1861-64), with Barbier de Meynard; Baber's *Mémoires* (1871); *Mirādī Námeh* (1882); *Tezkereh-i-evliyā* (1889); and, most important of all, the *Dictionnaire turco-oriental* (1870).

PAVIA, pá-vē'a. The capital of the Province of Pavia, Italy, situated on the left bank of the Ticino, 2 miles above its confluence with the Po, 18 miles south of Milan, with which it is connected by both river and canal (Map: Italy, B 2). A covered granite bridge (1351-54) of seven marble arches and an iron railway bridge connect the city with the suburb of Ticino, on the right bank of the river. The city is still mostly surrounded by its old walls and has an imposing appearance, but bears a sombre impress of antiquity. The principal streets are the Corso Vittorio Emanuele, Corso Cavour, and Corso Garibaldi. In former times Pavia was called the "city of a hundred towers," but few of these now remain. The oldest church is

San Michele, a fine example of the Lombard-Romanesque style, originally built before 1100, rebuilt after a fire early in the twelfth century in a style internally resembling Sant' Ambrogio at Milan. The present vaults, however, are modern, upon a system differing from the original. Another early Romanesque church is S. Pietro in Ciel d'Oro. The little church of S. Maria di Campanora is attributed to Bramante. The cathedral church of San Martino, a vast Renaissance structure begun in 1488, remained unfinished, but its façade and large dome were completed in 1898. It has a mosaic pavement and some good paintings. In a beautiful chapel attached to it are the ashes of St. Augustine in a magnificent Gothic sarcophagus. The Certosa di Pavia (q.v.), the most splendid monastery in the world, lies 5 miles north of the city. Pavia has a famous university with an imposing and interesting building. (See **PAVIA, UNIVERSITY OF**.) The Palazzo Malaspina contains a museum with a collection of paintings and antiquities and is associated with the lives of Bœthius and Petrarch. The other chief objects of interest are two theatres, a castle built (1360-66) by the Visconti and now converted into barracks, a huge bronze statue of Pope Pius V, a marble statue of Italia, and monuments to Garibaldi and to Volta. The Collegio Borromeo was founded in 1563 and the Collegio Ghislieri in 1569. Both offer scholarships. There are also an episcopal seminary, a lyceum, a technical school, an art and industrial school, and a deaf and dumb institute. Pavia has manufactures of machinery, hats, organs, chemicals, and leather. There are also important marble works. The yearly fair is largely attended, and there is a large trade in wine, rice, oil, silk, and cheese. Pop. (commune), 1881, 34,826; 1901, 35,447; 1911, 39,898; 1914, 40,266.

Pavia, the ancient Ticinum, was founded by the Ligurii. It became a place of considerable importance after the fall of the Roman Empire. It came into the possession of the Goths and Lombards, and the latter made it the capital of their Italian Kingdom, which was conquered by Charles the Great in 774. In 924 the city was taken and destroyed by the Hungarians. It became independent in the twelfth century. After having been weakened by civil wars it was conquered by the Visconti of Milan in 1359. From this time its history is merged in that of the Duchy of Milan and of Lombardy. Here, on Feb. 24, 1525, the forces of Charles V defeated the French and captured Francis I. The city was stormed and pillaged by Napoleon in 1796.

PAVIA. A town of Panay, Philippines, in the Province of Iloilo, 8 miles north-northwest of Iloilo. Pop., 1903, 5700.

PAVIA, UNIVERSITY OF. One of the oldest universities of Europe. It had its inception in a law school that flourished before the twelfth century, and even in the first half of the fourteenth century there still existed traces of the older institution. Galeazzo II Visconti obtained from Charles IV a charter for a Studium Generale in 1361, which conferred upon it all university privileges, and in 1389 it received the same privileges from Pope Boniface IX. In 1398 it was removed to Piacenza. With the death of Galeazzo it declined, and by 1404 it ceased to exist. In 1412 it was restored by Filippo Maria Visconti, and it soon vied with

the leading Italian universities, particularly in Roman law. It had a large attendance of foreigners. In the sixteenth and seventeenth centuries its fame declined, but after its reorganization in 1770 by Maria Theresa and in 1817 by Emperor Francis I it again assumed considerable importance among European universities. In 1913-14 it consisted of the faculties of law, medicine, and surgery, mathematics and natural science, letters and philosophy, and the School of Pharmacy. The attendance was over 1600. The Collegio Ghislieri, founded in 1569, prepares students for the university. The library contains 250,000 volumes, 140,000 pamphlets, and 1100 manuscripts.

PAVIA Y RODRÍGUEZ DE ALBUQUERQUE, pá-vé'á é ró-dré'gáth dá ál'búr-kér'ká, MANUEL (1828-95). A Spanish general. He entered the Royal Artillery College at Segovia (1841), and became lieutenant (1846), captain (1855), and major (1862), then joined the staff of General Prim (1865), and shared in Prim's unsuccessful revolutionary efforts (1866) and in the successful revolution of 1868. Under King Amadeo of Savoy (1871-73) he was in high favor. After the abdication of Amadeo he was the strong leader against the Carlists. When he became master of the situation in 1874, Pavia, being without personal ambition, asked Marshal Serrano to form a government with Sagasta and others, Conservatives and Radicals. Afterward, following the restoration of Alfonso XII, he sat in the Cortes on several occasions and, despite his opposition to Alfonso's marriage with Mercedes de Orléans, was by royal decree appointed life Senator (1880), and was President of the Supreme Council of War at his death.

PAVIE, pá-vé', THÉODORE-MARIE (1811-96). A French Orientalist. He was born at Angers. Early travels in the United States, Central America, and Canada resulted in the publication of his *Voyage aux États-Unis et au Canada* (2 vols., 1828-33); and subsequent travels through Asia, and the study of Asiatic languages, especially Sanskrit and Chinese, formed the foundation of valuable historical and literary contributions to the *Revue des Deux Mondes*, the *Journal Asiatique*, and the *Bulletin of the French Geographical Society*. They also led to appointments as professor of Sanskrit literature in the Collège de France from 1853 to 1857, where he succeeded his teacher Eugène Burnouf, and as professor of Oriental literature in the Catholic university of his native town, where he died May 1, 1896. His principal work is the *San-koué-tchi* (2 vols., 1845-51), a history of China in the thirteenth century. Other works are: *Fragments du Mahābhārata* (1844); *Les trois religions de la Chine* (1845); *Bhōdja-prabandha* (1855), a history of Bhoja, King of Malwa; *La littérature musulmane de l'Inde* (1847); *Krichna et sa doctrine* (1852); and numerous books of travel.

PAVILION (OF. *pavillon*, *paveillon*, Fr. *pavillon*, tent, from Lat. *papilio*, butterfly, tent, pavilion). Primarily, any light open structure providing shelter under a roof or canopy, whether permanent or temporary. The term is also used in the French sense to designate any relatively high and narrow portion of a large building made prominent by greater height or by a higher roof. In the Louvre each slightly projecting central or terminal pavilion is given a distinguishing name. The term is not gen-

erally applied to wings of considerable length, except in the case of the so-called pavilion hospitals.

PAVING. See **PAVEMENT**.

PAVING BRICK. A term properly applied to those brick used especially for paving highways. They are made from clays or shales that will burn to a vitrified body, but the methods of manufacture used are essentially the same as for common brick. Paving brick are usually either $2\frac{1}{2} \times 4 \times 8\frac{1}{2}$ inches, or $3\frac{1}{2} \times 4 \times 8\frac{1}{2}$ inches, the latter being commonly termed blocks. Paving brick are usually tested in the rattler for abrasive resistance, the loss in weight on this test being not over 22 per cent. The absorption should not exceed 4 or 5 per cent by weight. See **BRICK**. Consult Blanchard and Drowne, *Textbook on Highway Engineering* (New York, 1913); also *Proceedings of the American Society for Testing Materials*.

PAVIOTSO. See **SHOSHONEAN STOCK**.

PAVLOGRAD, páv'ló-grát'. A district town in the Government of Ekaterinoslav, Russia, situated on the Vólchia River, a tributary of the Samara, 50 miles east of Ekaterinoslav (Map: Russia, E 5). It has a Gymnasium and carries on a large trade in grain and horses. The town was founded in 1779 and is settled by Zaporogian Cossacks. Pop., 1897, 17,188; 1911, 40,484.

PAVLOV, páv'lóf. A volcano, about 7500 feet high, on the Alaskan Peninsula, in about long. 160° W. It was active in 1903.

PAVLOV, páv'lóf, IVAN PETROVITCH (1849-1916). A Russian physiologist, born in Rjasau, the son of a priest in the Greek church. He studied medicine at St. Petersburg (graduating in 1879; M.D., 1883) and became military surgeon. After a prolonged stay in Germany he was appointed (1890) professor of pharmacology in Tomsk and in the same year professor at the military academy at St. Petersburg. In the latter city he became also director of the physiological institute of the Imperial Academy of Sciences in 1891 and in 1897, at the same academy, professor of physiology in the physio-mathematical department. Pavlov founded a new school of Russian physiologists, his chief researches dealing especially with the physiology of the heart, secretion of the glands, digestion, and the production of gastric and pancreatic fluid. Following the investigations of Theodor von Bischoff, he improved on Heidenhain's method of producing a fistula and was thus able to demonstrate important observations in the flow of the fluid and digestion. Many of his ideas and experiments appeared in the works of his pupils. In 1904 he received the Nobel prize for medicine. Pavlov's works were written in Russian. That for which he received the 1904 Nobel prize in medicine was published in 1897 and was translated into German (1898), French (1901), and English (by W. H. Thompson in 1902, as *The Work of the Digestive Glands: Lectures*).

PAVLOVO, páv'ló-vó. An industrial town in the Government of Nizhni Novgorod, Russia, situated on the Oka, 40 miles southwest of Nizhni Novgorod (Map: Russia, F 3). It has steel works and match factories. There are a museum of cutlery and models and a library. Pop., 1897, 12,200; 1910, 20,000.

PAVLOWA, páv'ló-vá, ANNA (1886-). A Russian dancer, born in St. Petersburg and

trained in the Imperial Russian Ballet School under the famous master M. Fokine. She entered the school at 10, graduated in six years, and became prima ballerina at the Marianski Theatre. The fame of her dancing spread, and she resigned from the Imperial Ballet and made a continental tour, visiting Munich, Berlin, and Paris, finally reaching London in 1910. She was there proclaimed the most remarkable dancer since the days of Giulia Grisi and Fanny Elssler (qqv.). She toured America between 1913 and 1915, drawing immense crowds in New York and elsewhere. Pavlova's art left the fixed groove of her predecessors by disregarding sheer technique and making the dance a more natural and spiritual interpretation of the music to which it was set. Her best-known and most spectacular dance was the "Automne Bacchanale," an ecstatic revel; "The Swan" was another remarkable example of her work; while the interpretation of Liszt's "Les Preludes" by her company, with scenic setting by the Russian painter Boris Anisfeldt, combined all the best tendencies of the modern school.

PAVÓN, pa-vón', BATTLE OF. A battle fought in the town of Pavón in the Province of Santa Fé, Argentina, on Sept. 17, 1861, between the forces of the Province of Buenos Aires under General Mitre (qv) and those of the other provinces of Argentina under General Urquiza, for the supremacy of the Argentine Confederation. The former were completely successful and as a result General Mitre was elected President of the confederation.

PAVY, pā'vi, FREDERICK WILLIAM (1829-1911). An English physician, born at Wroughton, Wiltshire. He studied medicine at the University of London, graduating in 1853, and lectured at Guy's Hospital from 1856 to 1877. Pavy, who was especially interested in the function of the liver, asserting that this organ was not a storehouse of carbohydrates drawn upon at any time, had the largest practice in London in diabetic cases. Among his works are: *Recherches sur la destruction du sucre normal dans l'économie animale* (1854), a result of his studies with Claude Bernard; *Researches on the Nature and Treatment of Diabetes* (1862; 2d ed, 1869), *A Treatise on Foods and Dietetics* (1874; 2d ed, 1881), best known of all; *The Physiology of the Carbohydrates* (1894), *On Carbohydrate Metabolism* (1906).

PAWHUSKA, pa-hūs'ka. A city and the county seat of Osage Co., Okla., 60 miles southwest of Tulsa, on the Midland Valley Railroad (Map Oklahoma, E 2). It has an Indian agency and an Indian school. The city is situated in a productive farming and cattle-raising region. Oil and gas are found in the vicinity. Pawhuska has adopted the commission form of government. The water works and gas and electric-light plants are owned by the city. Pop., 1900, 2408; 1910, 2776.

PAWLE, pāl, J. LENNOX (1872-). An English actor, born in London. He studied at Sarah Thorne's Dramatic School at Margate, played in comedy at the Pavilion, Mile End, and between 1895 and 1905 appeared at various West End theatres in London. Afterward he was seen in *What Pamela Wanted* (1905) at the Criterion; *The Merry Widow* (1907) at Daly's; *The Babes in the Wood* (1907) at Drury Lane; *The Admirable Bashville* (1909) at His Majesty's, and *The Crisis* (1910) at

the New Theatre, all in London. In New York he gained attention (1910-11) by his captivating impersonation of Brooke-Hoskyn, the ex-butler in *Pomander Walk*, a play written by his father-in-law, Louis N. Parker. Subsequently he played in a revival of *Liberty Hall* (1913) and took the part of Micawber in Parker's *Highway of Life* (1914), a dramatization of Dickens's *David Copperfield*.

PAWLET, WILLIAM. See WINCHESTER, WILLIAM PAULET, MARQUIS OF.

PAWN. See BETEL.

PAWN'BRO'KING (from *pawn*, OHG. *pfant*, Ger. *Pfand*, pledge, from OF *pan*, pawn, pledge; usually considered identical with OF., Fr. *pan*, piece of a garment; more probably from OF. *paner*, Sp. *apandar*, to plunder, *apanar*, to take away + *broking*, connected with AS. *brūcan*, OHG. *brūhen*, Ger. *brauchen*, to use, need, Lat. *frui*, to use, enjoy). The business of lending money on the security of personal effects left in the possession of the lender. Pawnbroking has existed in some form in all ages and among all peoples. It is much older than banking, with which it was originally connected. The Chinese, Greeks, and Hebrews borrowed on pledges. In mediæval times pawnbroking was synonymous with the practice of lending money on usury. In Europe the business was carried on at first by Jews and later also by Lombards.

Pawnbroking is a legitimate business, but since the risk of loss and the expense of administering small loans are very great, the pawnbroker has often been allowed to charge a very high rate of interest. On the other hand, the fact that it lends itself easily to oppression has called for the strict regulation of the business by the state. In modern times these regulations have prescribed the maximum rate of interest that may be charged, what extra charges may be made, the period of redemption, and the manner of sale of unredeemed pledges. Recognizing the great disadvantage under which the poor borrower labors, efforts have been made to carry on the business in the interest of the borrowers. This effort has taken on the form of charitable lending agencies, known as *monts de piété* on the Continent. France is especially successful in maintaining these institutions. They are associated with town councils, hospitals, and charity bureaus. When endowed they charge no interest, and the highest interest exacted in these institutions is 12 per cent per annum. The Paris institution acts as the poor man's safe deposit, as it has excellent facilities for storage and makes a practice of disinfecting goods. Belgium follows French methods. The pawnbroking business has been controlled since 1618. The *monts de piété* are managed by town councils and charity administrators, while their funds are borrowed from the charity department.

Germany has royal, municipal, and private pawnshops. The private pawnshops are strictly regulated by law, and any city may prohibit them altogether. The municipal pawnshops are usually in connection with the savings banks and are self-supporting. In Austria-Hungary the business is still for the most part in private hands. The Imperial Pawnshop of Vienna, founded in 1707 by Joseph I, is now self-supporting. In Spain the *mont de piété* is connected with the savings bank. Sweden has had successful private companies since 1880. Few pawnshops are found in Switzerland, only one

in Bern. St. Petersburg and Moscow are the only cities of Russia maintaining municipal pawnshops.

The charter of the Bank of England gives that institution power to lend on plate and non-perishable commodities at 5 per cent. In 1695 the directors seriously considered establishing pawnshops, but the project was never carried into effect. Pawnbroking was first regulated under James I (1603), then under George III (1800). The business is now governed by the Pawnbrokers' Act, 1872 (35 and 36 Vict., c. 93), which restricts it to persons licensed to carry it on and regulates the method of conducting it.

In the United States the business has until recently been entirely in the hands of private pawnbrokers, who do business under State regulations or municipal ordinances. The State regulations usually provide for a license, a bond, regulation of interest charges, methods of sale, and the disposition of the surplus. The city ordinances often place the pawnshops under police control, providing for daily inspection or daily reports. Interest charges are regulated in most of the States. Two systems are in use: (1) an interest rate varying with the size of the loan; (2) a uniform rate, irrespective of the size of the loan. In the latter case extra charges are usually permitted, to cover the cost of handling small loans. The regulation of pawnbroking, whether by statute or by municipal ordinances, has proved a difficult task. Despite the mass of legislation dealing with the subject (there are said to be more than 400 different statutes and ordinances now in force in the United States which attempt to deal with the problem) cases of oppression are still common, due in large measure to the character of many of the persons who carry on the business. The only solution of the problem which holds out any hope of success is the gradual suppression of the private pawnshop and the assumption of the business by charitable or semicharitable institutions and by the municipal authorities. Municipal pawnshops were proposed for Philadelphia in 1816 by Dr. Mease. The oldest philanthropic concern in the United States is the Pawnors' Bank of Boston, started in 1859, which underwent many losses and discouragements. It is now the Collateral Loan Company and has paid a regular dividend of 8 per cent and more since 1890. The interest charge is 1 per cent a month. The number of loans made in a year exceeds 100,000, and the average amount per loan is about \$25. In 1892 a special committee of the Charity Organization Society of New York City recommended the formation of a company to loan on pledges, especially to borrowers approved by the Charity Organization Society. The company was incorporated in 1894 under the name of the Provident Loan Company, with a capital of \$100,000, later increased progressively and amounting to \$5,000,000 in 1910. Approximately half a million loans, averaging about \$30, are made annually. The society has regularly paid dividends of 6 per cent on capital stock. Interest charged on small loans is 1 per cent monthly; on sums of \$250 and over, 10 per cent annually.

After opposition from the pawnbrokers, who were well organized, Illinois passed a compromise measure, authorizing lending societies, but permitting loans only on personal property and

limiting the capital to \$50,000. The State Pawnors' Society opened its office in Chicago, Nov. 1, 1898. The society has a board of directors elected by the stockholders, with two additional members selected respectively by the Governor and the mayor. The maximum interest charged is 1 per cent per month, with an additional charge of $\frac{1}{2}$ per cent for storage and insurance. The pressure for loans has been heavy. The society pays 6 per cent dividends. At the time the office opened there were 67 pawnshops in Chicago. The Worcester Collateral Loan Association, the Workingmen's Loan Associations of Boston and Providence, the Provident Loan Company of Buffalo, and the Hebrew Free Loan Association of New York deal with chattel mortgages and indorsed loans.

PAWNEE, pa-né'. The most important tribe of the Caddoan stock (q.v.) of North American Indians. They formerly claimed a large territory upon the Platte River, in what is now Nebraska, ranging from the Niobrara on the north to the Arkansas on the south and occasionally extending their forays far down into Texas or New Mexico. They were in chronic warfare with every surrounding tribe with the exception of the Omaha, Ponca, and Oto, whom they treated as wards and dependents.

The Pawnees call themselves Skihiksihiks (men of men, or superexcellent men). The popular name appears to be derived from the Pawnee *pariki* (a horn), referring to their peculiar scalp lock, which was dressed to stand nearly erect. This mark indicates a Pawnee in the pictographs of the plains tribes and undoubtedly also gave origin to the tribal sign, now interpreted to mean "Wolf People." They have four bands or grand divisions, viz., *Chaui*, or Grand (i.e., principal), *Kitkehaki*, or Republican, *Pitahauerat*, or Tapage (noisy), and *Skidi*, or Loup (wolf). The dialects of the Pawnee, Skidi, and Wichita are all so closely related as to constitute but one language. The Pawnee appear to have been known to the Spaniards as early as 1626. They are noted upon Marquette's map of 1673 about where they were found in 1804 by Lewis and Clark, viz., the lower Platte near its confluence with the Missouri. By treaty in 1833 they ceded their lands south of the Platte and came under the supervision of an agent. In 1838 the great smallpox epidemic carried off at least 2000 of their number, and in 1849 probably a greater number perished by cholera. Since then their history has been one of swift and certain decline from disease, removal, and unceasing warfare in which the Pawnee found every man's hand against him. They have never, however, as a tribe been at war with the whites, but, on the contrary, have frequently furnished a contingent of scouts in the various difficulties with the Northern plains tribes. One main factor

in the introduction of disease has been the great overland trail, which passed directly through their territory. In 1858 they ceded all their remaining original territory except a strip 30 miles long by 15 wide upon the Loup River. In 1874 they sold this and removed to their present location in Oklahoma.

Like all the tribes of Caddoan stock, the Pawnee were principally agricultural and sedentary, building large circular houses of logs covered with earth, and raising abundant crops of corn, pumpkins, and other Indian vegetables, which they dried or cached for winter use. The skin tepee was used only for temporary purposes when upon the buffalo hunt, away from their permanent villages. They are of good physique and somewhat more robust than the regular hunting tribes. They were devoted to religious ceremonials, the Skidi being particularly noted for their bloody rite of human sacrifice, offered to the Morning Star, as the spirit of fertility on the occasion of the annual corn planting, the victim being a captive girl. See *PETALESHARO*.

The best early estimate of their population is that by the missionaries Dunbar and Allis in 1835, who give them 10,000. In 1840, after the smallpox, the same authorities estimated them at about 7500. In 1847 they were about 8400, but were again terribly reduced by the great cholera epidemic in 1849. They now number 633. Consult: G. B. Grinnell, *Pawnee Hero Stories and Folk-Tales* (New York, 1889); Fletcher and Murie, *Hako: A Pawnee Ceremony* (Washington, 1901); G. A. Dorsey, *Traditions of the Skidi Pawnee* (Boston, 1904); id., *Pawnee Mythology*, part i, published by the Carnegie Institution (Washington, 1906).

PAWTUCKET. An important manufacturing city in Providence Co., R. I., 4 miles north of Providence, on both sides of the Pawtucket River, at the head of navigation, and on the New York, New Haven, and Hartford Railroad (Map: Rhode Island, C 2). Pawtucket covers an area of nearly 9 square miles. It has Daggett Park, Collyer Monument, and a Soldiers' Memorial Monument, several interesting bridges of various types, Sayles Memorial Library, Home for Aged Poor, Memorial Hospital, and a State armory. Among the more prominent business structures are the Safe Deposit Building, Industrial Trust Building, Providence County Savings Bank, Taylor Building, and Kinyon Block. Other points of interest are Ten-Mile River and Pawtucket Falls, 50 feet in height, noteworthy alike for beauty of scenery and as the source of great water power.

Pawtucket is well known for the extent and variety of its manufactures, which include cotton, silk, and woolen goods, plush, hosiery, velvet braid, webbing, various kinds of machinery, foundry products, gymnasium supplies, electrical supplies, thread, haircloth, yarns, paper, and wire. There are also numerous dyeing, bleaching, and finishing establishments. The total value of the city's output in 1909 was \$37,696,000, representing an invested capital of \$40,094,000 and giving employment to 16,261 persons. The government is vested in a mayor annually elected, a bicameral council, and in administrative officials, the majority of whom are elected by the council. The school committee is independently chosen by popular vote. Pawtucket spent in 1913 in maintenance and operation \$838,000. The principal items of

expense were \$78,000 for the operation of the water works, \$243,000 for schools, \$73,000 for the police department, \$86,000 for the fire department, and \$48,000 for sanitation. The water works, which were built in 1878 by the city at a cost of over \$1,840,000, are owned and operated by the municipality. Pop., 1890, 27,633; 1900, 39,231; 1910, 51,622; 1914 (U. S. est.), 56,901.

The portion of the city of Pawtucket on the west side of the river was originally the principal village in the town of North Providence, which was incorporated in 1765. This town was divided in 1874, and the village of Pawtucket was consolidated with the town of Pawtucket on the east side of the river as the town of Pawtucket, which in 1886 was incorporated as a city. The portion of Pawtucket on the east of the river was originally in Massachusetts and was incorporated as the town of Pawtucket in 1828, having been set off from the parent town of Seekonk. In 1862 the town of Pawtucket, Mass., was ceded to Rhode Island and remained a separate town until its consolidation with the village of Pawtucket in North Providence in 1874. The first cotton factory in the United States was established here in 1790 by Samuel Slater. This mill, in which it is claimed the first Sunday school in the country was founded, is still standing. Consult W. A. Greene, *The Providence Plantations* (Providence, 1886), and Robert Grieve, *Illustrated History of Pawtucket* (Pawtucket, 1897).

PAX (Lat., peace), called also **PACIFICALE** and **OSCULATORIUM**. The "kiss of peace," and also a sacred utensil, employed in some of the solemn services of the Catholic church in the ceremony of giving the so-called "kiss of peace" during the mass. The practice of saluting each other—the men, men, and the women, women—during public worship, and particularly in the *agape*, or love feast, is frequently alluded to by ancient writers, as Cyril of Jerusalem, and Augustine. All the ancient liturgies without exception refer to it as among the rites with which the eucharist was celebrated; but they differ as to the time and the place in the eucharistic service in which it is introduced. The ceremony commences with the celebrating bishop or priest, who, after kissing the altar, salutes the deacon, not (in modern times) by an actual kiss, but by placing the hands upon his shoulders and slightly inclining the head towards him. By the deacon the salute is tendered to the other clergy assisting. Originally the laity also were included, but this has long since been abandoned. It is when the mass is celebrated by a high dignitary that the utensil called the pax is used. The pax is sometimes a crucifix, sometimes a reliquary, sometimes a tablet with a figure sculptured or enameled upon it. Having been kissed by the celebrant and by him handed to the deacon, it is carried by the latter to the rest of the clergy. The pax is omitted in the mass of Maundy Thursday (q.v.), to express horror of the treacherous kiss of Judas.

PAX (pseudonym). See **CHOLMONDELEY, MARY**.
PAXIUBA (pá'shé-oo'bá) **PALM**. See **IRIARTEA**.

PAXOS, pák'sós, or **PAXO**. One of the Ionian Islands (q.v.) (Map: Greece, B 4). It is 9 miles south of Corfu and about as far from Acarnania, Greece. It is about 5 miles long and

2 miles broad and is mainly a hilly mass of limestone, rising to 600 feet, with an absence of potable water. The sea has carved some remarkable caverns in its west and southwest coast. It is noted for its fruit and the fine quality of its olive oil. Goats and mules are raised. Pop., 1907, 4120.

PAXSON, FREDERICK LOGAN (1877-). An American historian, born in Philadelphia. He graduated from the University of Pennsylvania (B.S., 1898; Ph.D., 1903), and took an A.M. at Harvard in 1902. From 1903 he taught history successively in the universities of Colorado (till 1906), Michigan (1906-10), and Wisconsin, his special field being American history. He was also professor in the summer schools of the universities of Chicago (1909) and California (1913) and in 1910 was abroad as a research associate of the Carnegie Institution. His publications include: *The Independence of the South American Republics* (1903); *The Last American Frontier* (1910); *The Civil War* (1911), *Guide to Materials for United States History since 1783 in London Archives*, with C. O. Paullin (1914), *The New Nation* (1915).

PAXTON. A city and the county seat of Ford Co., Ill., 101 miles south of Chicago, on the Illinois Central and the Lake Erie and Western railroads (Map: Illinois, H 4). The most prominent buildings are the Carnegie library and the courthouse. Among the industrial establishments are furniture, canning, broom, and tile factories. Pop., 1900, 3036, 1910, 2912.

PAXTON, SIR JOSEPH (1801-65) An English architect and horticulturist, born at Milton-Bryant, near Woburn, Bedfordshire. As superintendent of the gardens of Chatsworth, in the employ of the Duke of Devonshire, he de-

Boston, where he first attracted attention in 1899 with a portrait of his wife, and where in 1906 he was appointed instructor in the art school of the Fine Arts Museum. He represents conservative tendencies in American art. His painting is solid and direct, well drawn and healthily realistic, but lacking in subtlety of color. Among his best-known paintings are "A Girl Sweeping" (Pennsylvania Academy), "Tea Leaves" and "Sylvia" (both in the Metropolitan Museum, New York), "The Pearl Necklace," "Cherry," and a portrait of President Cleveland.

PAXWAX. See LIGAMENT.

PAY AND ALLOWANCES. A term used to denote the rate of pay and allowances granted to officers and enlisted men of the military and naval services of the United States.

UNITED STATES ARMY

Allowances to officers and enlisted men are made on a basis of requirement and rank and may be either in kind or in cash in lieu of the amount to which such officer or soldier by regulation is entitled. The money allowance of clothing is allotted half-yearly for the first year, estimates for clothing being made quarterly as follows: on January 1 for a supply to last until June 30, on April 1 until September 30, on July 1 until December 31, on October 1 until March 31. Commanding officers settle the clothing accounts of their men six months after enlistment and afterward on June 30 and December 31 of each year. (For allowances of forage, see FORAGE.) Soldiers receiving cash or commutation in lieu of food (ration) are paid according to a scale which varies in amount from 25 cents per diem, allowed enlisted men on conclusion of furlough,

TABLE OF PAY (1915) ALLOWED BY LAW TO OFFICERS OF THE ARMY

GRADE	PAY OF OFFICERS IN ACTIVE SERVICE						PAY OF RETIRED OFFICERS					
	PAY OF GRADE		MONTHLY PAY				PAY OF GRADE		MONTHLY PAY

signed the large conservatory of Chatsworth (1836-40). This experience led him to propose a "crystal palace" of glass and iron for the great London Exhibition of 1851. It was the first time these materials had been employed on so extensive a scale. His design obtained for him great popularity and the honor of knighthood. The Crystal Palace of 1851 was removed from Hyde Park, but became the germ of the more splendid palace at Sydenham, the construction of which he superintended in 1862, the grounds were also laid out by him.

PAXTON, WILLIAM MCGREGOR (1869-). An American portrait and genre painter. He was born in Baltimore and studied under Denis Bunker in Boston and at the Ecole des Beaux-Arts in Paris under Gérôme. Paxton settled in

\$1 per diem to sergeants of post non-commissioned staff, on duty at stations where there are no other troops; \$1 per diem to a soldier on detached duty, to \$1.50 per diem to a soldier traveling under orders from a station, where his rations have been regularly commuted—which is the maximum allowance in lieu of rations for enlisted men. A specified weight of baggage, according to grade, is transported at public expense for officers and enlisted men both in change of station and in the field. Officers and certain grades of enlisted men also have a fuel and light allowance. See BAGGAGE, MILITARY.

Whenever there are sufficient quarters in a barracks or station, permanent quarters are assigned to the field and staff officers of the garri-

son. Regimental officers are provided with quarters according to convenience of location and the rank of the recipient. Bachelor quarters are assigned to officers without families. On the ar-

called commutation, in lieu of quarters are paid at the rate of \$12 per room, the number of rooms being in accordance with grade.

For allowances of food and ration, see RA-

* Discharged at termination of enlistment and reenlisted after three months, entitled pay of second enlistment.—[Act May 11, 1908]

rival of a command at a new station the original assignment of quarters is made by a board of officers consisting of the commanding officer, the two senior line officers present, the senior surgeon, and the quartermaster. Money allowances,

tion. The use of public horses by officers required to be mounted is regulated by department commanders, according to local exigencies. Officers below the grade of major required to be mounted, whether permanently or temporarily,

will be furnished with a proper mount by the quartermaster corps. Such officers may, however, provide themselves with suitable mounts at their own expense and of their exclusive ownership, and any officer of the grades indicated who so provides himself receives \$150 per annum additional pay for one mount and \$200 if he provides two. The sum of \$100 is allowed for the transport of each horse entitled to forage, and an attendant to accompany them. If such sum does not cover the actual cost, the excess must be refunded by the owner. When traveling under orders without troops on land, an officer is allowed mileage at 7 cents per mile; actual expenses only for sea travel.

In the British army, where the rates of pay are lower than in the United States, service in India is made more attractive by the numerous opportunities it offers for extra pay, originally commonly described as "batta." Allowances also are paid at a higher rate than at home.*

Half Pay is practically any form of reduced pay, and the term is still frequently used to describe the rate of pay of a retired or disabled officer.

UNITED STATES NAVY

Officers appointed from civil life are credited with five years' service in computing their rates of pay. This is to make some allowance for their educational period.

TABLE OF PAY OF COMMISSIONED OFFICERS OF THE NAVY

GRADE	Pay on shore duty	Pay on sea duty
Admiral of the Navy	\$13,500	\$13,500
Admiral*		10,000
Vice admiral*		9,000
Rear admiral (first nine)	8,000	8,800
Rear admiral (second nine)	6,000	6,600
Captain	4,000	4,400
Commander	3,500	3,850
Lieutenant commander	3,000	3,300
Lieutenant	2,400	2,640
Lieutenant, junior grade.	2,000	2,200
Ensign.	1,700	1,870

* The ranks of admiral and vice admiral are held by rear admirals while in command of a fleet or second in command.

† The foregoing rates of pay for officers below the grade of rear admiral are termed "base pay." In addition to this these officers receive 10 per cent of the base pay for each five years' service; but the total additions must not exceed 40 per cent of the base pay, and the pay of captains must not exceed \$5000, that of commanders \$4500, and that of lieutenant commanders \$4000.

‡ The pay of officers performing sea duty or shore duty beyond seas is 10 per cent in excess of their ordinary pay (base pay plus longevity additions). Thus, all captains (having served over 20 years) receive \$5000 when on shore duty in the United States. When at sea or on shore duty beyond seas they receive \$5500.

Officers on aviation duty are allowed 35 per cent increase of pay. This includes all allowances for quarters, heat, light, etc.

All naval officers on shore duty are given the same allowances for quarters, heat, and light as army officers of equal relative rank. See UNITED STATES, Navy.

Midshipmen at the naval academy receive \$600 per annum and 30 cents a day as ration money.

Officers on the retired list receive 75 per cent of their pay at time of retirement, one-half sea pay, or one-half leave pay, depending upon the circumstances of retiring. Commodores on the retired list receive the same pay as rear admirals of the second nine.

TABLE OF PAY OF WARRANT OFFICERS, PAYMASTERS' CLERKS, AND MATES

	At sea	Shore duty	Leave or waiting orders
WARRANT OFFICERS AND PAYMASTERS' CLERKS:			
First 3 years' service	\$1,500	\$1,125	\$875
Second 3 " "	1,825	1,250	1,000
Third 3 " "	1,750	1,625	1,125
Fourth 3 " "	2,000	1,625	1,250
After 12 " "	2,250	2,000	1,500
MATES:			
In service Aug. 1, 1894.	1,500	1,125	875
Appointed since	1,125	875	625

Warrant officers include boatswains, gunners, carpenters, sailmakers, pharmacists, and machinists. Chief warrant officers receive the same pay and allowances as ensigns. Warrant officers, paymasters' clerks, and mates receive 30 cents a day as ration money.

Officers of the Marine Corps. The officers of the marine corps receive the same pay and allowances as officers of the army.

TABLE OF PAY OF NURSE CORPS, UNITED STATES NAVY

Superintendent.	\$1800 per annum
NURSES:	
First 3 years' service	\$50 per month
Second " "	65 " "
Third " "	60 " "
After 9 " "	65 " "

Nurses assigned to duty as chief nurses receive \$30 per month extra. Nurses who subsist themselves are entitled to 40 cents a day in lieu of ration. When not furnished quarters, they are allowed \$15 per month for quarters. Nurses serving outside the United States (except in Cuba, Porto Rico, and Hawaii) are entitled to 10 per cent additional pay. Nurses are entitled to the same traveling allowances as members of the nurse corps of the army.

In addition to the foregoing rates of pay, each enlisted man receives 10 per cent additional pay. If his base pay is increased for any one of the following reasons, then the 10 per cent is computed on the total base pay plus increase:

(a) Each good-conduct medal (see GOOD-CONDUCT BADGE), pin, or bar entitles the holder to 75 cents per month.

(b) Upon reenlistment \$5 per month is added to the pay of the rating held; upon all subsequent reenlistments \$3 per month is added.

(c) Honorable discharge in the previous enlistment carries with it an increase of pay of \$1.36 per month.

(d) Seamen gunners' certificate.

The following temporary appointments carry pay as indicated, in addition to the pay of the ratings held: coxswains of steam launches, \$5 per month; seamen in charge of hold, \$5; messmen, \$5; signalmen, first class, \$3; signalmen, second class, \$2; signalmen, third class, \$1; heavy-gun pointers, first class, \$10; heavy-gun pointers, second class, \$6; intermediate-gun pointers, first class, \$8; intermediate-gun pointers, second class, \$4; secondary-battery gun pointers, first class, \$4; secondary-battery gun pointers, second class, \$2; gun captains, \$5; graduate of gun captains' school, \$2; ships' tailor, \$20, \$15, or \$10, according to size of ship; navy mail clerk, \$20, \$15, \$5, according to size

of ship; assistant mail clerk (on large ships only), \$15; certificate of graduation as cooks or stewards, \$5; divers' pay, \$1.20 per hour.

At the end of each enlistment every enlisted man is entitled to four months' leave with pay, if he enlists again within four months from date of discharge. If he does not take the leave,

his Arctic experience with excellent technique and broad solid handling. They include "The Bay of Death," the best of four pictures illustrating the Franklin expedition, and "Never Retreat" (Modern Gallery, Vienna). For the Museum of Natural History in Vienna he executed mural paintings, "Views in Franz Josef

* Chief petty officers of all kinds, who have passed the requisite examinations and been given permanent appointments, receive \$70 per month.

he is given four months' pay upon reenlistment.

An enlisted man of the navy may retire after 30 years' service. His pay upon retirement is 75 per cent of the full pay received at that time, plus 75 cents per month for each good-conduct medal or bar. For men leaving the service before 30 years, see NAVAL RESERVE.

Enlisted Force of the Marine Corps. Enlisted men of the marine corps receive the same pay and allowances as enlisted men of the army. Men regularly detailed as gun pointers, gun captains, navy mail clerks, messmen, or signalmen, or holding good-conduct medals, pins, or bars, receive the extra compensation allowed to enlisted men of the navy for these services.

PAYER, pi'ér, JULIUS VON (1842-1915). An Austrian polar explorer and painter. He was born at Schönan, near Teplitz, Bohemia, and was educated in the military academy at Wiener-Neustadt. Commissioned in the army (1859), he later distinguished himself in Alpine surveys. In 1869-70, taking part in the second German expedition to the North Pole, he explored Fligely Fiord, East Greenland, and adjacent regions. With Weyprecht, in the Austro-Hungarian expedition, he discovered and explored Franz Joseph Land (consult his *Die oesterreichisch-ungarische Nordpolexpedition in den Jahren 1872-74*, 1876). On his return he devoted himself entirely to painting, studying for two years in Frankfort under Hasselhorst, three years in Munich under Wagner, and four years in Paris. From the first he worked on large canvases, painting stirring episodes from

Land." He won gold medals in Munich (1883), Berlin (1886), and Paris (1889).

PAYMASTER. An officer in the military or naval service charged with the payment of troops and other duties involving the receipt and disbursement of public funds. The payment of troops of the United States army is made by an officer of the quartermaster corps (q.v.) who is designated as such and not as a paymaster.

In the United States navy each large vessel has a paymaster and one or two pay clerks. He has charge of the public funds carried, the clothing and provisions for the enlisted men, and stores for all departments of the ship except small quantities issued for current use; and he makes such purchases as may be ordered by the commanding officer. He is the commissary officer of the ship and has charge of the purchase, preparation, and service of provisions for the men. At shore stations a paymaster may be the pay officer, keeper of the general store (in which are supplies for all departments of the station), or is the accounting officer for the care of manufacturing costs.

There are paymasters in practically all foreign navies, but their duties vary. In some services they are pay officers and accountants only; in others they perform commissary duties, are storekeepers in charge of supplies, purchasers of supplies, secretaries to flag officers, etc. The numbers in the navies of the Great Powers were greatly increasing during the European War of 1914 and are constantly changing. On July 1, 1914, they were: Great Britain, 686;

Germany, 267; France, 219; Japan, 362; Italy, 239; Austria, 184.

PAYMASTER-GENERAL. An officer of the British ministry, but not of the cabinet, charged with superintending the issue of all moneys voted by Parliament. He has no control over the sums issued, paying merely on the order of the department concerned. He is always either a peer or a member of the House of Commons and changes with the ministry. The paymaster-general is not paid, but he is assisted by a deputy and a staff of clerks, and the annual cost of the whole department amounts to about £25,000.

PAYMASTER'S CLERK, U. S. N. See CLERK, PAYMASTER'S.

PAYMENT. In law, the satisfaction or discharge of a legal obligation by the delivery of money, or something which the creditor accepts in lieu of money. But a creditor is not bound to take a check, bill of exchange, or promissory note, nor anything but money (legal tender) in payment of a debt. If he accepts a bill or note, it is regarded as conditional payment only, unless he expressly agrees to take it in absolute payment. Payment is therefore employed in a more limited sense than performance, which implies the fulfillment of any legal obligation, as carrying out the provisions of an agreement or contract to do work or furnish materials to another. In order to be effectual, payment must be made to the proper party, i.e., either to the one to whom it is due personally or to some other person lawfully authorized by him to receive it, and it must be of the exact amount due. It should be made at the exact time and place agreed upon, or implied by law, in order to avoid a claim for interest from that time, or the commencement of an action. In general where no place for payment has been previously agreed upon by the parties, the debtor must seek the creditor, or he may be considered as in default. The chief consequences which may ensue on a default of payment are, in general, to give the creditor the right to have immediate recourse to any security, as to sell an article pledged as security, or to foreclose a mortgage or other lien, and if the contract is a continuing one and payments become due in installments to rescind the contract, to refuse to proceed further, and sue the debtor for the amount then due and unpaid. Where payment is made to one of several joint creditors, the debtor is discharged, even though the one to whom he paid it does not account to his fellow creditors. The effect of a valid payment is to discharge the debtor from his obligation. But payment of a debt by a third person without the authority of the debtor does not operate to discharge the debt unless such payment is ratified by the debtor; neither does the payment by the debtor of less than the full amount of his debt, even though such less amount was accepted by the creditor as payment in full. Consult the authorities referred to under CONTRACT. See CREDITOR; DEBTOR; LEGAL TENDER.

PAYMENTS, EQUATION OF. See EQUATION OF PAYMENTS.

PAYN, JAMES (1830-98). An English novelist. He was born in Cheltenham, graduated at Trinity College, Cambridge, in 1852, and adopted literature as a profession. He contributed largely to periodicals, became coeditor with L. Ritchie of *Chambers's Journal* in 1858, and in the following year was made sole editor,

which position he held until 1874. From 1883 to 1896 he was the successor of Leslie Stephen as editor of the *Cornhill Magazine*. The novel *Lost Sir Massingberd* (1864) was the first of his works to attract attention, and after its appearance he published more than 70 novels, among which are *Cecil's Tryst* (1872), *Fallen Fortunes* (1876), *By Proxy* (1878), *A Grapic from a Thorn* (1881), *The Heir of the Ages* (1886), *The Eavesdropper* (1888), *Gleams of Memory* (1894), *In Market Overt* (1895), *Another Burden* (1897), and a collection of essays, *The Backwater of Life* (1899), published posthumously with an introduction by Leslie Stephen.

PAYNE, CHARLES HENRY (1830-99). An American Methodist Episcopal clergyman and educator, born at Taunton, Mass. He graduated from Wesleyan University in 1856 and then studied at the Biblical Institute, Concord, N. H., for a short time. He entered the ministry in 1857. His life was spent in the pastorate until 1876, after which for 12 years he was president of Ohio Wesleyan University. From 1888 till his death he was secretary of the board of education of his church. Dr. Payne was a member of various important Methodist conferences and a member of the committee on the revision of the *Methodist Hymnal* in 1876. He was the author of *Guides and Guards in Character Building* (1882); *Daniel the Uncompromising Young Man* (1883); *The Saloon or the Sabbath, Which?* (1894).

PAYNE, HENRY B. (1810-96). An American politician and capitalist, born at Hamilton, N. Y. He graduated at Hamilton College in 1832 and two years later began to practice law at Cleveland, Ohio. In 1849 he was elected to the State Senate by the Democrats and was their candidate for United States Senator in 1851 and for Governor in 1857. At the Charleston convention in 1860 he exerted his influence to check the secession movement and during the Civil War remained a strong Union man. In 1872 he led the Ohio delegation at the Baltimore convention which nominated Horace Greeley for the presidency. Two years later he was elected to Congress by a fusion of Democrats and Liberal Republicans and was one of the representatives of the House on the Electoral Commission in 1877. He was elected United States Senator in 1884 and served from 1885 until 1891. He was for many years interested in various industrial, railroad, and mining projects and accumulated a large fortune.

PAYNE, HENRY CLAY (1843-1904). An American political leader and cabinet officer. He was born at Ashfield, Mass., was educated at Shelburne Falls Academy, and in 1859 entered business in Northampton. In 1863 he removed to Milwaukee, Wis., where he established himself as a merchant, and where from 1875 to 1885 he was postmaster. Subsequently he acquired large interests in electric-railway and lighting companies. In 1886 he became president of the Wisconsin Telephone Company, after 1887 he was for several years president of the Milwaukee and Northern Railroad, and in 1893 he was appointed one of the receivers for the Northern Pacific. Meanwhile he gained success as a political manager, serving for many years as chairman of the Wisconsin Republican State Central Committee. In 1880 he became a member of the Republican National Committee

and of its executive committee, and as vice chairman he conducted presidential campaigns in the West in 1896 and 1900. In 1897 he was offered the post of Ambassador to Germany by President McKinley, but declined. From 1902 until his death he was Postmaster-General in President Roosevelt's cabinet.

PAYNE, JOHN (1842-). An English poet and translator. A solicitor by profession, he retired to a life devoted to literature. He was one of a cluster of Neo-Romantic poets inspired by Rossetti, Morris, and Swinburne, others of the group being Théodor Marzials and Arthur O'Shaughnessy (qq.v.). Payne's verse comprises: *A Masque of Shadows* (1871); *Intaglios* (1870), a sonnet sequence; *Songs of Life and Death* (1872); *Lautrec* (1878), a vigorous narrative poem; *New Poems* (1880). For the Villon Society he translated Villon's *Poems* (1878). He also translated *Arabian Nights* (9 vols., 1882-84); *Tales from the Arabic* (1885); *Aladdin and the Enchanted Lamp* (1885); Boccaccio's *Decameron*; *Quatrains of Omar Khayyam* (1898); *Poems of Shemseddin Mohammed Hafiz of Shiraz* (3 vols., 1901); *Flowers of France* (1907), translations of representative French poems from Ronsard to Saint-Amant. *The Poetical Works of J. Payne* appeared in two volumes (London, 1902), and *Selections from the Poetry of John Payne* (New York, 1906) was edited, with an introduction, by Tracy and Lucy Robinson.

PAYNE, JOHN HOWARD (1791-1852). An American actor and playwright, best known, however, as the author of *Home, Sweet Home*. Born in New York, he lived in childhood at East Hampton, L. I. Payne showed great precocity. At 13 years of age, while a clerk in a mercantile house in New York, he secretly edited a weekly paper, the *Thespian Mirror*. He was a student of Union College, when the bankruptcy of his father interrupted his education, and he decided to go on the stage as the best means of supporting the family. He made his debut at the Park Theatre, New York, Feb. 24, 1809, as Young Norval in *Douglas*. This enterprise proved an artistic and pecuniary success, and he subsequently appeared before large and enthusiastic audiences in Boston, Philadelphia, and Baltimore. In 1813 he sailed for England and made his appearance in London at Drury Lane Theatre as Master Payne, "the American Roscius," in his original part of Young Norval. His performances were well received by the public. After this he supported himself in England as actor, manager, and playwright, but, owing to his lack of business ability, was often in financial embarrassments. In 1815 Payne published in London a selection of poems called *Lispings of the Muse*. His fugitive writings, besides verse, include many articles in criticism, one of the best known being an essay on "Our Neglected Poets," published in the *Democratic Review* in 1838.

Payne adapted many plays from the French and produced a number of original ones, among them *Brutus*, or *the Fall of Tarquin*, *Thérèse*, *Virginia*, and the comedy of *Charles II*. The song *Home, Sweet Home* occurs in his opera of *Clari*, or *the Maid of Milan*, which was produced at the Covent Garden Theatre in May, 1823. The music was adapted by Henry R. Bishop from an old melody which Payne had heard in Italy. The publishers of this song are said to have cleared 2000 guineas by it within a year,

and the opera was very successful; by all this, however, Payne himself profited but little. In 1826-27 he edited in London a periodical called the *Opera Glass*. In 1832 he returned to America. He was appointed American Consul at Tunis, Africa, in 1842, was recalled in 1845, and reappointed in 1851. He died there April 9, 1852, and was buried in the cemetery of St. George at Tunis. In 1883 his remains were brought to Washington. Consult: G. Harrison, *John Howard Payne* (new ed., Philadelphia, 1885); C. H. Brainard, *John Howard Payne: A Biographical Sketch* (Washington, 1885); W. T. Hanson, *Early Life of John Howard Payne* (Boston, 1913).

PAYNE, JOSEPH (1808-76). An English educator, born at Bury St. Edmunds. He was chiefly self-educated and in 1830 founded a school that developed into the successful Denmark Hill Grammar School for boys. In 1845 he and his wife founded the Mansion House School at Leatherhead and stayed there up to their retirement to Bayswater, London, in 1863. Payne's educational ideas were founded upon those of Jacotot, and he wrote in condemnation of the Eton system. In 1872 at the College of Preceptors he became the first English professor of the theory and practice of education. His works were edited by his son, Dr. J. F. Payne, and published in two volumes: *Lectures on the Science and Art of Education* (1883) and *Lectures on the History of Education, with a Visit to German Schools* (1892).

PAYNE, OLIVER HAZARD (1842-). An American capitalist, the benefactor of Cornell Medical School and other institutions. He was born in Cleveland, Ohio, graduated from Yale University in 1863, and, entering the 124th Ohio Infantry as first lieutenant in 1862, became colonel in 1863, and was brevetted brigadier general of volunteers in 1865. From 1866 to 1884 he was an iron manufacturer and oil refiner in Cleveland and subsequently was engaged in the same business in New York City. He became a director of the Standard Oil Company and of the American Tobacco Company and vice president of the Tennessee Coal, Iron, and Railroad Company. Payne gave \$500,000 to help establish and maintain the Cornell University Medical School, subsequently contributed largely to its support, and in 1913 provided an endowment of \$4,500,000. He also made large gifts to the University of Virginia and to Western Reserve University.

PAYNE, PETER (c.1380-1455). An English Lollard, born near Grantham in Lincolnshire. He studied at Oxford, where he became a follower of Wiclif and was principal of St. Edmund Hall (1410-14). At a time when the professing and teaching of Wicliffe doctrine demanded the highest moral courage Payne did not hesitate, and in 1416 he was excommunicated, having failed to appear for trial on the charge of heresy. In complete sympathy with the adherents of John Huss, he fled from England to Prague, where Elizabeth of Bohemia, widow of King Wenceslas, protected him and where he became a prominent member of the Taborite party. (See TABORITES.) As such he appeared in many religious conferences and by his extreme views did much to block a union of quarreling sects. The story of the latter years of his life, which were passed in Bohemia, is full of confusing detail, and it is uncertain whether Payne submitted after the defeat of

the Taborites. All of his writings dealt with the defense of Wiclif's teachings. Consult Baker, *A Forgotten Great Englishman* (London, 1894).

PAYNE, SERENO ELISHA (1843-1914). An American lawyer and legislator, born at Hamilton, N. Y. He graduated from the University of Rochester in 1864 and, after studying law privately, was admitted to the bar in 1866. He then became a member of the successful firm of Payne, Payne, and Clark, practicing at Auburn. He promptly entered politics as an ardent Republican. Between 1867 and 1879 he held, successively, the offices of city clerk of Auburn, supervisor, district attorney of Cayuga County, and president of the Auburn Board of education. With the exception of the Fifth Congress Payne served continuously in the House of Representatives from 1883 until his death. From 1899 until 1910 he was chairman of the Ways and Means Committee, and after 1900 he and Speaker Cannon were the most powerful Republican members and leaders. In party councils he had a wide influence, attending every national convention after 1892. In 1898 he was appointed by President McKinley a member of the Joint High Commission to negotiate a reciprocity treaty with Canada. His reputation as a statesman, however, was achieved in connection with tariff legislation. He was active and influential in the passage of the McKinley and Dingley tariff laws and was one of the framers of the so-called Payne-Aldrich Act of 1909. In politics Payne was, from conviction, a standpatter, a pronounced conservative, and an advocate of party regularity. He was accorded the unusual honor of a State funeral held in the House.

PAYNE, WILLIAM HAROLD (1836-1907). An American educator, born in Farmington, Ontario Co., N. Y. In 1858 he was appointed principal of a school in Three Rivers, Mich., and he held the same position in other schools of that State, concluding with Adrian, where he remained 10 years, and was then elected to the newly created chair of pedagogy in the University of Michigan (1879). He was chancellor of the University of Nashville, Tenn., and president of the Peabody Normal College from 1888 until 1901, when he returned to the University of Michigan, serving as head of the department of education till his death. He wrote: *Chapters on School Supervision* (1875; new ed., 1903); *Educational Doctrine* (1882); *Contributions to the Science of Education* (1887); *The Education of Teachers* (1901); and translated three of Compayré's works: *History of Pedagogy* (1886); *Lectures on Teaching* (1888); *Elements of Psychology* (1890).

PAYNE, WILLIAM MORTON (1858-). An American critic and educator, born at Newburyport, Mass. He was assistant librarian of the Chicago Public Library (1874-76), teacher in Chicago high schools after 1876, literary editor of the *Chicago Morning News* (1884-88), of the *Chicago Evening Journal* (1888-92), and associate editor of the *Dial*. At various times he lectured on English literature at the universities of Wisconsin, Kansas, and Chicago. Payne was honored with membership in the National Institute of Arts and Letters. His writings, besides critical articles in the field of modern literature, include: *The New Education* (1884), *Little Leaders* (1895), *Various Views* (1902); *The Greater English Poets of the Nineteenth Century* (1907); *Leading*

American Essayists (1909); *Björnstjerne Björnson* (1910). He translated Björnson's *Segurd Slembe* (1888) and Jaeger's *Ilsen* (1890) and edited *English in American Universities* (1895); *American Literary Criticism* (1904); *Select Poems of Swinburne* (1905); Swinburne's *Mary Stuart* (1906).

PAYNE SMITH, ROBERT (1819-95). An English theologian and Orientalist. He was born at Chipping Campden, Gloucestershire, and entered Pembroke College, Oxford, where he pursued Oriental studies and took the Sanskrit scholarship in 1840 and a Hebrew scholarship in 1843. After his ordination he spent three years in pastoral work at Crendon, Long Winchenden, and Thame, then became classical master at the Edinburgh Academy and later preached also at Trinity Chapel. In 1853 he went to London as head master of the Kensington proprietary school and pursued his favorite Oriental studies at the British Museum. In 1857 he became sublibrarian at the Bodleian Library, and here he began his great work, the *Thesaurus Syriacus*, the first part of which was published in 1868. From 1865 to 1870 he was regius professor of divinity at Oxford, and in 1869 he delivered the Bampton lectures, published as *Prophecy a Preparation for Christ* (1869). In 1870 he became dean of Canterbury. His position in the Church was one of sympathy with the evangelicals and his popularity extended widely, even in the Nonconformist bodies. For 15 years he was a member of the Old Testament revision committee. Besides the Syriac lexicon and the Bampton lectures he published: *S. Cyrilli Alexandriae Archiepiscopi Commentarii in Lucæ Evangelium Quæ Supersunt Syriace* (1858); *St. Cyril's Commentary on St. Luke's Gospel* (1859), in English; *The Third Part of the Ecclesiastical History of John, Bishop of Ephesus, now First Translated from the Original Syriac* (1860); *Catalogi Codicum Manuscriptorum Bibliothecæ Bodleianæ Pars Sexta, Codices Syriacos, Carshumcos, Mendæos Completens*, and commentaries on Daniel, Jeremiah, Samuel, and Genesis. His great learning has not preserved his biblical work from becoming antiquated. His memoir appeared with his *Sermons on the Pentateuch* (1896).

PAYNTER, WILLIAM. See PAINTER, WILLIAM.

PAYSANDÚ, pi'sán-doo'. A port of Uruguay, situated on the Uruguay River, 170 miles north of Buenos Aires (Map: Paraguay, H 4). The city has handsome public buildings, a good system of public schools, a library, and several scientific and benevolent societies. It is the centre of a rich agricultural and pastoral district. Its principal industry is the preservation of beef for the foreign market, especially ox tongues, to a brand of which it gives its name. It has regular communication by steamer with Buenos Aires and Montevideo. The city ranks next to Montevideo in size and commercial importance. Pop. (est.), 22,000. Paysandú was founded in 1782.

PAYSANS, pá'zán', LES (Fr., The Peasants). A gloomy tale by Balzac (1844), of which only the first part appeared before his death.

PAYSON, EDWARD (1783-1827). An American Congregational minister. He was born at Rindge, N. H., graduated at Harvard College in 1803, studied theology with his father, the Rev. Seth Payson, pastor at Rindge, and from 1807 till his death was pastor of the Congrega-

tional church at Portland, Me. His sermons, published at various times, were much read and gave him a wide reputation. His complete works were published with a memoir by Asa Cummings (3 vols., Philadelphia, 1846; 2d ed., 1859).

PAYTA. See **PAITA**

PAZ, pñth, ENRÍQUEZ DE. A Spanish dramatist, commonly called Enríquez Gómez (q.v.).

PAZ, pñs, LA. The name of several places in Spanish America. See **LA PAZ**

PAZAND, pñ'zánd, or **PAZEND**, pñ'zënd. See **PAHLAVI LANGUAGE AND LITERATURE**.

PAZARJIK. See **TATAR BAZARJIK**.

PÁZMÁNY, pñz'mä-ny', **PETER** (1570-1637). A Hungarian cardinal and author. He was born at Grosswarden of Protestant parents, but went over to the Roman Catholic church in 1583 and entered the Society of Jesus in 1587. He was an ardent Catholic and carried on almost single-handed the work of the Counter Reformation in Hungary. He became provost of Turóc, Bishop of Nyitra, Archbishop of Esztergom, and in 1629 Urban VIII made him Cardinal Primate of Hungary. For Catholic education in Hungary he did much by the foundation of the Pazmaneum (1623), a seminary for Hungarians in Vienna, and of several other schools. His published works were edited by Bognár (Budapest, 1894 et seq.). Consult Schwicker, *Peter Pázmány* (Cologne, 1888).

PAZ SOLDÁN, pñs sól-dán', **MARIANO FELIPE** (1821-86). A Peruvian historian and geographer. He was born in Arequipa, studied law there and at Lima, and practiced in both cities. He held high judicial offices in Lima and was sent to the United States in 1853 to report on penal systems. This mission resulted in the foundation of a detective bureau in Peru and of great improvements in the prisons of the country. He was Minister of Foreign Relations under President Castilla and of Justice in the term of Balta and later held the post of director of public works. He wrote *Atlas geográfico del Perú* (1861), *Historia del Perú independiente* (1866), *Diccionario geográfico estadístico del Perú* (1877); *Historia de la guerra del Pacífico* (1884).

PEA (mod. sing. of *peasc*, AS. *pise*, *piose*, *pea*, from Lat. *pisum*, Gk. *πίσος*, *pisos*, *πίσος*, *pson*, *pea*), *Pisum*. A genus of plants of the family Leguminosæ. The common pea or garden pea (*Pisum sativum*) and the field pea (*Pisum arvense*) are natives of the south of Europe and of Asia. They are both climbing annuals, with pinnate leaves, ovate leaflets, and branching tendrils in place of a terminal leaflet. Peas have been cultivated in the East from time immemorial, and were apparently introduced into Europe very early in the Middle Ages. Their cultivation extends from warm climates, as India, to the cooler regions of the North. The seeds of the garden pea are used for culinary purposes both in a green and in a ripe state. There are two main types of garden peas, those having smooth round seeds and those with wrinkled seeds. The former are the earlier and harder. The wrinkled varieties are better in quality. Some varieties have edible pods. The green succulent pods of these are eaten in much the same manner as green beans. These are grown to a considerable extent in Europe and offered by seedsmen in America, but are not popular. There are innumerable varieties both of the field pea and of the garden pea. Some of

the latter have long stems and require for their support stakes of 6 or 8 feet in height; others are of humbler growth; and certain dwarf kinds, preferred as most convenient in many gardens, succeed very well without stakes. The largest kinds are sown in rows about 4 feet apart. A calcareous soil is desirable, but good crops are secured on almost any good wheat or maize soil. Peas are cultivated to a considerable extent as a field crop in the northern United States and Canada, and both the grain and straw are used in feeding stock. The plant withstands light frosts, and may therefore be grown as early in spring as the ground can be worked. Semidwarf varieties are preferred for field culture, since they lodge less and the crop is more easily harvested.

The other species of *Pisum* are few. But the name pea is often given to species of other papilionaceous genera. A plant found on some parts of the shores of Great Britain, as well as of continental Europe and North America, known as the sea or beach pea, has been commonly referred to the genus *Pisum*, but is now called *Lathyrus maritima*. It much resembles the common pea, has large reddish or purple flowers on many-flowered stalks, and its seeds have a disagreeable bitter taste. The sweet pea (q.v.) and everlasting pea are also species of *Lathyrus*. The chick-pea (q.v.) is a species of *Cicer*. The cowpea is *Vigna sinensis*.

Food and Feeding Value. Both green and dried peas are much used as articles of diet. The shelled green pea has the following average percentage composition: water, 74.6, protein, 7, fat, 0.5; total carbohydrates, 16.9, and ash, 1.0. Dried peas have the following percentage composition: water, 9.5; protein, 24.6, fat, 1; total carbohydrates, 62, and ash, 2.9. Dried peas are used for soups and purées, cooked in other ways, and sometimes baked like beans. They are rich in protein, and, being readily digested if cooked soft, are a valuable food. As food, green peas are especially prized for their delicate flavor, which is retained when they are properly canned. The varieties with edible pods (pods and seeds) have the following percentage composition: water, 81.8, protein, 3.4; fat, 0.4, total carbohydrates, 13.7, ash, 0.7. Pea meal is too sodden to be fed alone, and should always be mixed with bran, ground oats, or corn meal. Pea vines have the following percentage composition: water, 15, protein, 13.7, fat, 2.3, nitrogen-free extract, 37.6, crude fibre, 24.7, and ash, 6.7. In northern regions peas, especially when ground, replace corn to some extent, and, on account of the large amount of protein they contain, have a high feeding value. See **PEA INSECTS**. See **PLATES OF FLOWERS, LEGUMES**.

PEA'BODY. A town, including several villages, in Essex Co., Mass., 2 miles west of Salem, on the Boston and Maine Railroad (Map. Massachusetts, F 2). It has the Peabody Institute, with a library of 38,000 volumes, established in 1852 by George Peabody, and the Eben Dale Sutton Reference Library. There are a public park (Emerson), the J. B. Thomas Hospital, a fine high school, and a parochial school and convent. The town is a manufacturing centre of considerable importance, its products including leather, morocco, shoes, gloves, leather-working machinery, electrical supplies, marine hardware, candy, cotton goods, soap, glue, etc. The government is administered by town meetings. There are municipal water works and a muni-

cial electric-light plant. First a part of Salem and then of Danvers, Peabody became a separate town under the name of South Danvers in 1855. In 1868 its present name was adopted in honor of George Peabody, who was born here and lived here for some years. Pop., 1900, 11,523; 1910, 15,721; 1915 (state census), 18,522.

PEABODY, ANDREW PRESTON (1811-93). An American Unitarian clergyman. He was born at Beverly, Mass., and graduated in 1826 at Harvard College, where, after studying at Harvard Divinity School, he was tutor in mathematics. From 1833 to 1860 he was minister of a Unitarian church in Portsmouth, N. H., and then was Plummer professor of Christian morals and chaplain of Harvard till 1881. He edited the *North American Review* (1852-61). Among his numerous works are *Lectures on Christian Doctrine* (1844); *Reminiscences of European Travel* (1868); *Manual of Moral Philosophy* (1873); *Christianity and Science* (1874, new ed., 1890); *Christian Belief and Life* (1875); *Moral Philosophy* (1887); *Harvard Reminiscences* (1888); *Harvard Graduates Whom I Have Known* (1890); *Masterpieces of Cicero* (new ed., Boston, 1912). Consult the memorial sermon by James De Normandie (Boston, 1893).

PEABODY, CECIL HOBART (1855-). An American mechanical engineer, born at Burlington, Vt. He graduated in 1877 at Massachusetts Institute of Technology, where in 1883 he became assistant professor of steam engineering and in 1893 professor of marine engineering and naval architecture. Between graduation and his return to Boston he had been professor of mathematics in the Sapporo Imperial Agricultural College of Japan and assistant professor of mechanical engineering in the University of Illinois. His publications include *Tables of the Properties of Saturated Steam and Other Vapors* (1888, 8th ed., 1909); *Thermodynamics of the Steam Engine* (1889, 6th ed., 1910); *Valve Gear for Steam Engines* (1892); *Steam Boilers*, with E. F. Miller (1897; 3d ed., 1912); *The Steam Engine Indicator* (1900); *Naval Architecture* (1904, 3d ed., 1911); *Propellers* (1912); *Computations for Marine Engines* (1913).

PEABODY, ELIZABETH PALMER (1804-94). An American educator, born at Billerica, Mass. She was for a time connected with the school of Amos Bronson Alcott, in Boston, of which she wrote an account entitled *A Record of Mr. Alcott's School* (3d ed., 1874); but later she came under the influence of Friedrich Fröbel (q.v.) and was one of the most active in introducing the kindergarten system into the United States. She published a number of works, including: *Crimes of the House of Austria* (1852); *Kindergarten Culture* (1870); *Kindergarten in Italy* (1872); *Reminiscences of Dr. Channing* (1880); *Letters to Kindergartners* (1886).

PEABODY, EPHRAIM (1807-56). An American Unitarian clergyman. Born at Wilton, N. H., he graduated at Bowdoin College in 1827 and at Harvard Divinity School in 1830, served as pastor of a Unitarian church in New Bedford (1838-46), and thereafter until his death occupied the pulpit of King's Chapel, Boston. He was the founder of the Boston Provident Society. His sermons, with a memoir, appeared in Boston in 1857 and in 1858 a selection from his writings entitled *Christian Days and Thoughts*.

PEABODY, FRANCIS GREENWOOD (1847-). An American Unitarian clergyman and author, born in Boston. He graduated from Harvard in 1869 and from the Harvard Divinity School three years later, was pastor of the First Parish Church in Cambridge, Mass., from 1874 until 1881, when he became Parkman professor of theology at Harvard. Five years afterward he was transferred to the Plummer professorship of Christian morals. Dr. Peabody was acting dean of the Divinity School in 1885-86 and 1893-94, and dean in 1901-05. His publications include: *Short Addresses to Young Men on Personal Religion* (1896); *Afternoons in the College Chapel* (1898); *Jesus Christ and the Social Question* (1900), a book of much influence; *Religion of an Educated Man* (1903); *Jesus Christ and the Christian Character* (1905); *Mornings in the College Chapel* (1907); *The Approach to the Social Question* (1909); *Sunday Evenings in the College Chapel* (1911); *The Christian Life in the Modern World* (1914). For his father and brother, see **PEABODY, EPHRAIM**, and **ROBERT SWAIN**.

PEABODY, GEORGE (1795-1869). An American merchant and philanthropist, born Feb. 18, 1795, in that part of Danvers, Mass., now known as Peabody. When about 16 years old he went to Georgetown, D. C., where within two years he entered the employ of Elsha Riggs, a wholesale dry goods merchant. Twice during the War of 1812 he had been a volunteer. The firm removed to Baltimore in 1815 and afterward established branches in New York and Philadelphia. Peabody, who, after a rapid rise, became head of the firm in 1829, continued to reside in Baltimore during the next few years. In 1835, as one of three commissioners of the State of Maryland, he negotiated in London a loan of \$8,000,000 and declined to receive the large commission to which he was entitled. Later (retaining a branch in Baltimore) he founded the house of George Peabody & Co. in London and there he remained until his death. During his long absence from the United States he maintained the liveliest interest in his native land. This was shown by a liberal gift to promote the American exhibit in the World's Fair of 1851, by a contribution for the second Kane expedition to the Arctic seas, and by a series of banquets on Independence Day, which were attended not only by his countrymen but by Englishmen of official rank and otherwise distinguished. During the later years of his life his gifts increased in amount and were devoted to a great variety of purposes. To his native village he gave about \$200,000 to found the Peabody Institute and Library and to the northern part of the town of Danvers \$100,000 for a like institution; to the publication funds of the Massachusetts Historical Society and the Maryland Historical Society \$20,000 each, to the Peabody Academy of Science in Salem, Mass., \$140,000, to Harvard and Yale \$150,000 each, for the establishment, respectively, of a museum of archaeology and a museum of natural history. Phillips Academy at Andover and Kenyon College in Ohio received \$25,000 each. During the Civil War Peabody gave \$10,000 to the United States Sanitary Commission. Three other gifts transcended those already named. As a token of affection for the city of Baltimore, where he laid the foundation of his fortune, he devoted more than \$1,250,000 to the establishment of

the Peabody Institute, which comprises a library, an art gallery, a conservatory of music, and arrangements for the delivery of public lectures and for the bestowal of prizes in the public schools. To the city of London he gave \$2,500,000 for the construction of lodging houses—a fund which has since increased enormously. A separate board, known as the Trustees of the Peabody Education Fund (q.v.; see also **PEABODY COLLEGE FOR TEACHERS**), received more than \$3,000,000 to promote education in the Southern States. This was perhaps the most influential of all his gifts. Such munificence as he had displayed, then without parallel, brought him gratitude and honor from England and the United States. The Queen offered to make him Baronet or to give him the Grand Cross of the Bath, but he declined both honors and expressed a preference for a token to send to his native town. The Queen had a miniature portrait of herself painted and framed in gold. This, together with a gold box containing evidence that Mr. Peabody had been given the freedom of London, was placed in the Institute at South Danvers (now Peabody). Congress caused a gold medal to be struck in acknowledgment of his gifts for education, which had aggregated about \$7,000,000. Oxford made him a D.C.L. in 1867.

George Peabody was never married. His death occurred in London, Nov. 4, 1869. His body was brought to the United States by H.M.S. *Monarch*, convoyed by a French and an American vessel and received by an American squadron. Many eulogies were delivered, of which the most important were those of Robert C. Winthrop (Boston, 1870), S. T. Wallis (Baltimore, 1870), Edward Everett (*Orations*, vol. iii, Boston, 1869), and H. W. Foote (ib., 1869). Consult also the biography by Phoebe A. Hanaford (Boston, 1870) and the *Brief Sketch* by J. L. M. Curry (Cambridge, 1898). A bronze statue of Peabody, by William W. Story, stands near the Royal Exchange in London and a replica of it in front of the Peabody Institute in Baltimore.

PEABODY, GEORGE FOSTER (1852-). An American capitalist and promoter of education, especially in the south. He was born at Columbus, Ga. As president, vice president, or director, he became connected with various realty and mining companies. From 1896 to 1905 he was treasurer of the Democratic National Committee. Retiring from active business in 1906, he devoted his time to educational work. Peabody became director of the General Education Board, treasurer of the Southern Education Board, and trustee of the American Church Institute for Negroes, of Hampton and Tuskegee institutes, of the University of Georgia, Colorado College, and the Brooklyn Polytechnic Institute. He received honorary degrees from Harvard, Washington and Lee, and Georgia universities.

PEABODY, JOSEPHINE PRESTON (?-). An American poet and dramatist, born in New York and educated at the Girls' Latin School, Boston, and at Radcliffe College. From 1901 to 1903 she was instructor in English at Wellesley. In 1906 she married Prof. L. S. Marks of Harvard University. The Stratford-on-Avon prize went to her in 1909 for her drama *The Piper*, which was produced in England in 1910; in America at the New Theatre, New York, in 1911. Her other work comprises *The*

Wayfarers: A Book of Verse (1898); *Fortune and Men's Eyes: New Poems, with a Play* (1900); *Marlowe* (1901), a drama; *The Singing Leaves* (1903); *The Wings* (1905), a drama; *The Book of the Little Past* (1908); *The Singing Man* (1911), poems; *The Wolf of Gubbio* (1913), a drama; *New Poems* (1915).

PEABODY, ROBERT SWAIN (1845-). An American architect, and brother of Francis Greenwood Peabody. Born at New Bedford, Mass., he graduated in 1866 from Harvard (A.M., 1870) and studied also at the Ecole des Beaux-Arts, Paris, in 1868. After 1870 he practiced in Boston and after 1909 was chairman of the Boston Park Commission. Peabody designed, among other notable buildings, the Providence Railroad station (since demolished) and Chamber of Commerce, in Boston, the City Hall, Worcester, Mass., Machinery Hall at the Chicago World's Fair (1893), and the Chamber of Commerce, Cleveland, Ohio. He served as an overseer of Harvard in 1888-89 and again after 1907, was president of the American Institute of Architects (1900-01) and of the Boston Society of Architects (1902-05, 1907-09), and became a member of the National Institute of Arts and Letters and associate of the National Academy of Design in 1910. His publications include *A Holiday Study of Cities and Ports* (1908) and *An Architect's Sketch Book* (1912).

PEABODY, SELIM HOBART (1829-1903). An American educator, born at Rockingham, Vt. He graduated at the University of Vermont in 1852, during the following years held professorships of mathematics, physics, and engineering at several colleges, and from 1880 to 1891 was president of the University of Illinois. In 1893 he was chief of the department of liberal arts at the World's Columbian Exposition, in 1899-1900 editor and statistician of the United States Commission to the Paris Exposition, and in 1900 superintendent of the division of liberal arts at the Pan-American Exposition. From 1892 to 1895 he served as president of the Chicago Academy of Sciences and from 1889 to 1891 as president of the National Council of Education. Peabody was editor in chief and later associate editor of the *International Cyclopaedia*. His publications include: *Astronomy* (1869); *Juvenile Natural History* (3 vols., 1869); *New Practical Arithmetic*. (1872); *American Patriotism* (1880); *Charts of Arithmetic* (1900).

PEABODY BIRD (named from the Peabody Glen in the White Mountains). A local name in New England for the white-throated sparrow (*Zonotrichia albicollis*). It is one of the largest and handsomest sparrows of North America, second in size only to the fox-colored sparrow, from which it differs markedly in color. The peabody bird is variegated brown, black, and white above, clear gray beneath, with a pure white throat and prominent black, white, and yellow stripes on the head. It breeds from northern Michigan and New England northward to Labrador, and winters from New England to Florida. It is most remarkable for its very agreeable, though brief, song, consisting of two low soft notes followed by a thrice-repeated triple note clearly whistled. In Massachusetts it is usually interpreted as I—I, *Pea-bod-y, Pea-bod-y, Pea-bod-y*; in Maine, *All day, whit-tle-ing, whit-tle-ing, whit-tle-ing*; in Canada, *Sweet Can-a-da, Can-a-da, Can-a-da*.

PEABODY COLLEGE FOR TEACHERS, more properly **GEORGE PEABODY COLLEGE FOR TEACHERS**. An institution for the higher education of teachers, organized in 1910 at Nashville, Tenn. The college is the lineal successor of the Peabody Normal College, founded in 1875 as the Peabody Normal School of the South by the trustees of the Peabody Education Fund (q.v.) Normal College was in existence from 1875 to 1911 and was maintained in connection with the University of Nashville and supported by annual appropriations from the Peabody Fund. In 1909, after many years of effort on the part of the alumni of the Normal College and friends of education in the South, the trustees of the Peabody Fund completed plans for the permanent endowment of an all-southern teachers' college by assembling donations amounting to nearly \$1,750,000, of which \$1,000,000 was from the Peabody Fund, \$250,000 from the State of Tennessee, and the remainder from the city of Nashville, Davidson County, and the University of Nashville, which gave grounds and buildings estimated in value at \$250,000. In 1911 the trustees of the newly organized college elected as president Dr. Bruce R. Payne, and an effort was at once begun for increasing funds. These were raised to \$3,250,000 by Jan 1, 1915. In addition to this sum the alumni association pledged \$250,000. A new site adjoining the Vanderbilt property was purchased. The campus comprises over 50 acres of wooded lawns. In September, 1915, four new buildings had been completed at a cost of \$750,000. The final plan contemplates 18 academic buildings, 15 residence halls, demonstration and practice schools, a social-religious service building, and an eight-acre athletic field and playground. The college opened its doors on June 26, 1914, for summer school. In this there were enrolled 1108 students. There were 200 different courses offered. In 1914-15 the enrollment of students was 275, while the faculty numbered 29.

PEABODY EDUCATION FUND. A fund founded in 1867 by George Peabody (q.v.) for the purpose of promoting "intellectual, moral, and industrial education in the most destitute portion of the Southern States." The gift of foundation consisted of securities to the value of \$2,100,000, of which \$1,100,000 were in Mississippi State bonds, afterward repudiated. In 1869 an additional \$1,000,000 was given by Mr Peabody, with \$384,000 of Florida bonds, also repudiated later. The trustees, chosen from the most prominent public men in the United States, had authority to expend 40 per cent of the principal during the first two years, after which the amount was to remain unchanged for 30 years, when the fund might be used and distributed for educational purposes. The main purpose of the fund was to aid elementary education, and that by strengthening existing schools rather than by founding new ones. Only schools having an attendance of more than 100 and a school period of 10 months were to be aided. To such schools \$300 was to be given, to those having an attendance of 200, \$600 was given; and to those having an attendance of 300, \$1000 was given. All grants were made on condition that the district contributed twice as much as the Peabody Board, and in all cases the board worked in unison with State and local school authorities. Especial attention was given to the support of normal schools, particularly those on

independent foundations. Scholarships of \$200 in value, later of \$100 and traveling expenses, were granted to numerous students. In 1875 the Peabody Normal School, later Peabody Normal College, was established at Nashville, Tenn. The annual distribution of the products of the funds averages about \$80,000 per year, and in the 30 years of the fund terminating in 1898 a total of more than \$2,500,000 was distributed. In 1903 it was decided to change the Normal College into an institution for the higher professional training of teachers. (See **PEABODY COLLEGE FOR TEACHERS**.) With the opening of the college the work of the fund, mainly to raise the standard of education in the South, was realized to be at an end and its affairs were wound up. Consult L. P. Ayres, *Seven Great Foundations* (New York, 1911).

PEACE (OF. *paix*, *paiz*, Fr. *paix*, from Lat. *pax*, peace; connected with *pangere*, Gk. *πηνύειν*, *pégnynai*, to fasten, Skt. *pāśa*, bond, and perhaps with Goth., OHG. *fāhan*, AS *fōn*, Ger *fangen*, to seize, take). In law, in a general sense, the internal good order of a community that is violated by the commission of offenses against the law. This general sense is expressed in England by the phrase the "King's peace" and in the United States by that of the "peace of the State or Commonwealth" or of the "public peace." Originally the expression "the King's peace" was used in a narrower sense, with reference to the sanctity of the King's house, or to the special protection of the King's servants, or of those to whom he had accorded the same protection.

Offenses against the public peace are criminal offenses, known as breaches of the peace, the wrongfulness of which consists either in an act by the offender which is an actual disturbance of public peace and order, as in the case of riot or affray, or an act which is a constructive rather than an actual disturbance of the peace in that it has a tendency to cause public disturbance or disorder, as unlawful assembly or seditious libel.

The more common forms of offenses against the peace are riot, affray, forcible entry and detainer, unlawful assembly, challenge to fight, and seditious libel. In addition to these well-defined offenses there are other offenses against the peace, having no specific name, which are punishable as misdemeanors. Thus, in some States the malicious killing of another's horse and the causing of a disturbance in the home of another have been held to be offenses against the peace.

Forcible entry and detainer is strictly not an offense at common law. It was made so, however, by an early English statute, and is now regarded as a common-law offense.

Seditious libel is an offense against the peace as tending directly to a breach of the peace by giving affront to public opinion, as by libels vilifying officers of the government, the courts of justice, or even the sovereign or chief officers of a foreign government. Ordinary libels are also for the same reason sometimes classified as offenses against the public peace. Consult Sir J. F. Stephen, *History of the Criminal Law of England* (3 vols, London, 1883); Sir William Blackstone, *Commentaries on the Laws of England* (4th ed., 2 vols., Chicago, 1899); Pollock and Maitland, *History of English Law* (2d ed., 2 vols., Cambridge, 1903); also references under **CONSTABLE**; **CRIMINAL LAW**. See **AFFRAY**;

BREACH OF THE PEACE; FORCIBLE ENTRY AND DETAINER; JUSTICE OF THE PEACE.

PEACE, BILL OF. See **EQUITY.**

PEACE CONFERENCE. See **PEACE MOVEMENT.**

PEACE CONVENTION. The name given to a convention held in Washington, on the invitation of Virginia, in February, 1861, just before the outbreak of the Civil War, for the purpose of arranging a peaceful settlement of the difficulties between the North and the South. Fourteen free States and seven slave States were represented and each State was allowed only a single vote. Ex-President Tyler presided over the convention. A committee, upon which each of the 21 States was represented, submitted a report, which was adopted, recommending the adoption of certain specified amendments to the Federal Constitution. These amendments generally favored the South, but were not wholly satisfactory to either section, and were not favorably received by either House of Congress.

PEACE MOVEMENT. While traces of the peace movement, or pacifism, are to be found in classical literature and are extremely numerous in the writings of the Church fathers, the origins of the modern movement do not date beyond the fifteenth century. In 1462 Georg von Podiebrad, King of Bohemia, advanced a plan for a federation of Christian nations, with an international parliament to discuss matters of common interest and a tribunal, backed by an international military force, to hear and determine all disputes between nations. A similar plan was proposed by Henry IV of France about the end of the sixteenth century. Schemes of world organization designed to assure permanent peace were launched in considerable numbers in the seventeenth century. Of these the most noteworthy were that of Emeric de Lacroix (1623), which proposed a permanent congress of nations sitting at Venice and urged universal free trade as a means of creating international harmony; that of Grotius (*De Jure Belli et Pacis*, 1625), including an international congress and an arbitration tribunal, as well as an attempt to regulate and humanize war itself; and that of William Penn (*An Essay on the Present and Future Peace of Europe*, 1693), which proposed a representative congress of states, meeting annually or biennially, an arbitration tribunal, and the obligation upon all states in the federation to join in the coercion of any which should refuse to submit disputes to arbitration or should fail to accept the awards of the tribunal.

In 1712-16 the Abbé St. Pierre published a bulky work entitled *Projet de la paix perpétuelle*, which exerted a notable influence upon thought in this field for over a century. As in the earlier projects, the plan of a permanent congress of European states and an arbitration tribunal appears in the project of the Abbé St. Pierre. In addition new administrative organs of politics, finance, military affairs, and law are proposed; conciliation is urged, leaving arbitration as a last resort; and the first definite proposal of disarmament is made. Each state, by this plan, would limit its standing army to 6000 men. In case force were required to subject an unwilling member to the award of the arbitration tribunal, the cost was to be distributed among the states in proportion to their revenues.

Among eighteenth-century adherents of the

scheme of a congress of nations with a tribunal competent to settle all disputes between states were Leibnitz, Turgot, and many of the Encyclopædists. Pacifism was widely prevalent among the intellectual leaders of France in the third quarter of the eighteenth century. In Germany it had fewer adherents. Frederick the Great looked with great scorn upon the ideas of the Abbé St. Pierre, and rejected, as smacking of that system, the proposal of the Austrian Chancellor von Kaunitz for a reduction in the armies of the two states to one-fourth of their footing at the close of the Seven Years' War. In England the ideal of international organization found scientific expression in the work of Jeremy Bentham, *Principles of International Law* (1786-89). Bentham proposed an international congress and arbitration tribunal with an armed force to execute its decrees. The novelty of his work consists mainly in the stress upon measures for avoiding international disputes. To this end he demanded the codification and extension of international law, limitation of armaments by treaty, equal treatment for all nations in commerce, and liberalization of colonial policy. An important contribution to the ideas of the peace movement was made by Immanuel Kant, who emphasized the desirability of leaving decisions of peace and war to the people (1793) and of basing international law upon a federation of free states. The menace of standing armies and competitive armaments was pointed out by Kant, as well as the menace of increasing war debts. Ideas of peace, in reaction from the miseries of the French wars, gained a wide following in the early part of the nineteenth century and played a considerable part in the formation of the Holy Alliance (1815), later diverted into an agency of reaction against the popular movement in Europe.

The first half of the nineteenth century contributed no new ideas to the peace movement, but laid the basis for its popularization through the formation of permanent peace societies, national and international. The first peace society in the world was organized in New York in 1815 by David Low Dodge. In the same year the Massachusetts Peace Society was organized by Noah Worcester, and under the auspices of this society was published the *Friend of Peace*, the first periodical devoted to the cause of peace. The organization of peace societies in America proceeded rapidly and by 1826 there were about 50 in existence. In 1828 the American Peace Society was organized in New York by William Ladd. In 1834 the headquarters of the society were removed to Hartford, in 1834 to Boston, in 1911 to Washington.

A peace society was organized in London by William Allen and Joseph Price in 1816. The first peace society on the European continent was organized at Geneva in 1830. Informal relations of sympathy early obtained between the several national peace societies, and in 1843 an international peace congress was held in London, with 294 British delegates, 37 American, and 6 from the continent of Europe. The practical programme of the peace societies of the period, originally advanced by the American Peace Society, was the organization of a congress of nations, meeting periodically, and a permanent arbitration tribunal with power to settle all disputes between nations. Enforcement of the decrees of the tribunal was to be left to international public opinion. In 1847 Elihu Burritt,

one of the most active leaders of the movement in America, went to Europe to carry on an agitation for the organization of a congress and a court of nations. At an international peace congress at Brussels, held in 1848, Burritt secured the adoption of resolutions looking to this end. In 1849 an international peace congress was held at Brussels under the presidency of Victor Hugo. Among the distinguished delegates were Cobden, Thierry, Girardin, and Bastiat. The congress adopted resolutions urging limitation of armaments and the placing of a ban upon foreign loans for war purposes. Through the next decade several congresses were held, without the development of anything new in principle or method. Of some importance was the introduction of the peace movement in legislative bodies. In 1832 the Massachusetts Senate adopted a resolution in favor of arbitration. In 1837 a petition of the same character was submitted to Congress. A resolution in favor of international arbitration was adopted by the United States Senate in 1853 and submitted to the President. In 1849 Cobden introduced in the British Parliament a resolution favoring arbitration treaties with all nations, which was defeated by a vote of 176 to 97. The peace agitation of the period has been credited with a certain influence in determining the attitude of the Paris Conference of 1856 towards friendly mediation in international disputes. Otherwise its influence was mainly educative. It commanded the support of many of the most distinguished statesmen of the time—Cobden, Peel, Disraeli, Garibaldi—and even Napoleon III sought to take the initiative in calling a European congress to consider means of preserving peace and limiting the burden of armaments. Prussia proved averse to the plan; hence nothing came of it.

A new factor in the movement was the agitation for the humanization of war, led by Henri Dunant. This agitation led in 1864 to the Geneva Convention (q.v.), at which 16 governments were represented. The convention adopted by the conference later received the adhesion of practically all civilized nations and has served to mitigate in some measure the hardships endured by the wounded and captured. See RED CROSS.

The international peace movement suffered a severe check from the wars of the third quarter of the nineteenth century. The Crimean War disorganized the British movement, the Civil War disrupted the American movement, and the Franco-Prussian War gave a serious setback to French pacifism. A number of societies of considerable importance were, however, organized during the period, such as the League of Peace and Liberty, organized in 1867 by Lemonnier, Victor Hugo, and Garibaldi, the Peace League of the Netherlands (1870), and the Belgian Union of the Friends of Peace, organized under the presidency of Emile de Laveleye. Most significant was the organization in 1873 of the Institut de Droit International, at the initiative of the Belgian jurist, G. Rolin-Jacquemins. The most distinguished jurists of Europe were in attendance, and their work influenced the later development of the peace movement in a marked degree. In 1887 a delegation of British members of Parliament, under the leadership of Randal Cremer, visited America to lay before President Cleveland a document signed by 232 members of Parliament in favor of a British-

American arbitration treaty. In 1888 the supporters of arbitration in the British Parliament met in Paris with the supporters of arbitration in the French Chamber and formed the organization now known as the Interparliamentary Union. This organization rapidly increased through the accession of members of parliamentary bodies of most of the Western nations. In 1913 it had about 3600 members from 22 states, representing over one-third of the aggregate membership in the parliaments represented. An American group of the Interparliamentary Union was organized in 1904 and quickly assumed leadership in the movement for arbitration treaties in America. The Pan-American movement, inaugurated by Blaine's proposal for a Pan-American congress in 1881 (though not realized until 1889), included among its objects the establishment of means for the peaceable settlement of international disputes on the Western continent.

In 1889 the first World's Peace Congress was held at Paris. From that year the international movement gained steadily in vigor. At the third World's Peace Congress, held at Bern in 1892, a permanent bureau, known as the International Peace Bureau, was created, to work towards the centralizing of the peace movement. In Germany and Austria a strong sentiment favorable to the peace movement was created by the publication in 1890 of Baroness von Suttner's book, *Die Waffen nieder*. In 1892 Dr. Alfred H. Fried founded the first German periodical devoted to peace, *Die Waffen nieder*.

After 1890 peace organizations multiplied throughout the world. New organizations were founded to advance the cause of arbitration treaties, to extend the scope of international law, to investigate the causes of international strife, and to propose means for their removal. The increasing burden of military preparations enlisted in the peace movement large numbers of men who had held aloof so long as the humanitarian aspects of the question were alone emphasized by peace advocates. An indication of this broadening of the base of the movement is given by the development of the Lake Mohonk Conferences on International Arbitration, held at Mohonk Lake, N. Y., annually since 1895. Originally attended chiefly by men who were already identified with the peace movement, the conferences gradually attracted an increasing number of delegates from business organizations (chambers of commerce, etc.) until in 1915 most of the important business organizations in the United States had accorded their support to the purposes of the conferences. A great impetus to the study of the financial and economic aspects of war and military preparations was given by the publication of J. de Bloch's monumental work on war, published in Russia in 1898 and translated into German the following year. Bloch's analysis of the probable results of a war between the modern Great Powers indicated the probability that conclusive results, if attainable, would be had at the cost of universal bankruptcy. Bloch's work excited lively discussion throughout Europe and induced the Czar of Russia to issue an invitation to the Powers to meet in conference at The Hague.

Another factor of increasing importance in the peace movement after 1890 was the anti-militarism of the Social Democratic and Labor parties of Europe. According to Socialist theory, all war not actually defensive is a heavy

incubus upon labor. Aggressive wars, especially when directed towards the acquisition of colonies, are capitalistic and their tendency is to keep labor in subjection. While the working class antimilitarism movement held aloof from the general or bourgeois peace movement, its existence offered a certain parliamentary support to practical proposals for limiting armaments and instituting arbitration treaties.

The First Peace Conference, called by invitation of the Czar of Russia, assembled at The Hague, May 18, 1899. One hundred delegates were in attendance, representing 21 European states, the United States and Mexico, China, Japan, Persia, and Siam. The conference adjourned on July 29, after adopting a final act including three conventions, three formal declarations, and six resolutions. The conventions related (1) to the pacific settlement of international disputes; (2) to the laws and usages of war on land; (3) to the adaptation of the rules of maritime warfare to the Geneva Convention (q.v.). The declarations related to (1) prohibition of the use of projectiles or explosives launched from balloons for a period of five years; (2) prohibition of the use of projectiles diffusing asphyxiating or deleterious gases; (3) prohibition of the use of dumdum bullets. The resolutions urged the desirability of limiting the burden of armaments, proposed that questions relating to the rights and duties of neutrals, inviolability of private property in maritime warfare, and the bombardment of towns, be referred to a later conference; that military budgets be limited, and that types and calibre of maritime artillery and small arms be studied by governments with a view to establishing uniformity. A Permanent Court of Arbitration, sitting at The Hague, was created. A permanent list of jurists eminent in international law, of whom each power might nominate four, constituted the personnel of the court; for particular arbitrations each party might choose two arbitrators either from the permanent list or from persons not members. Provision was also made for international commissions of inquiry, with investigative powers only, to examine into and report upon international disputes not affecting the national honor or vital interests. It was further agreed that in case of dispute between two signatory powers the offer of good offices by a third power was not to be considered an unfriendly act.

The initiative towards calling a second Hague Peace Conference was taken by the United States through a circular of the Secretary of State addressed to the Powers on Oct. 21, 1904. The conference was assembled upon the invitation of the Czar of Russia on June 15, 1907. Delegates were present representing 21 European states, 19 American, and 4 Asiatic. The conference adopted conventions looking to the pacific settlement of international disputes; to limitations upon the use of force for the collection of debts; to regulation of the law of prize and of the conduct of war on land and sea; and against the launching of explosives from air craft. Preliminary steps were taken for the summoning of a third Conference in 1915, a project repeatedly urged by peace organizations throughout the world until the outbreak of the European War in 1914.

The agitation for international peace was carried on with increasing energy by the various peace organizations after the opening of the

twentieth century, despite the setback given by the Boer and Russo-Japanese wars. Especial stress was laid upon the financial cost of war and armaments, and leading statesmen in all the chief countries accepted in principle the desirability of limiting armaments through international agreement. In England and America a strong popular movement against war, based essentially on economic grounds, was produced by the publication of Norman Angell's *Europe's Optical Illusion* (1909; later republished under the title *The Great Illusion*). The argument of this book, that the gains from aggressive warfare in a world of internationalized capital and credit are illusory, the costs overwhelming and shared by neutrals as well as belligerents, brought to the peace movement large numbers of persons who had remained apathetic to the traditional appeals of pacifism. The propaganda for peace was placed on a solid financial basis by the establishment in 1910 by Edwin Ginn of the World's Peace Foundation with an endowment of \$1,000,000 and the Carnegie Endowment for International Peace with an endowment of \$10,000,000. The purposes of the two endowments are identical; the World's Peace Foundation is, however, more strictly devoted to direct propaganda, while the Carnegie Endowment conducts research on the causes of war under the division of economics and history, seeks to stimulate the development of international law under a division of that name, and conducts propaganda, largely through the agency of existing societies, under the division of intercourse and education. Thus, the endowment lent its support to a reorganization of the American Peace Society, placing that society in the position of parent company to the various State and local organizations, which receive subsidies from the endowment only through the American Peace Society. A similar work of coordination is carried on by the endowment in foreign countries.

A natural result of the European War was relaxation of the peace propaganda in the belligerent countries. In England, however, a new organization made its appearance in 1914 under the name of the Union for Democratic Control, directed especially against the committing of nations to warlike policies through secret diplomacy. In the United States an organization appeared in 1915 under the name of the League of Peace, having for its object the formation of a league of nations bound by treaty to arbitrate all disputes arising among them and using joint military and naval forces to coerce recalcitrant members.

In the early history of the peace movement the prevailing view involved opposition to any and all wars. This view of international passivism, peace at any price, fails to command the adhesion of any considerable faction of the modern peace movement, although it is often erroneously held to constitute an article of the pacifist creed. The essential doctrine of modern pacifism is that war is always an evil—though not necessarily the greatest evil—to be avoided by whatever means may be available. The majority of pacifists are not advocates of the immediate disarmament of any nation, irrespective of the policy of its neighbors, though holding that exaggerated armaments lead to the creation of international suspicion that makes for war.

Bibliography. The most satisfactory account of the peace movement as a whole is given

by A. H. Fried, *Handbuch der Friedensbewegung* (Leipzig, 1911-13). This work contains a select bibliography especially satisfactory for European publications. For the early American movement, consult W. E. Channing, *Discourses on War* (Boston, 1839; new ed., 1903); J. A. Bolles and others, *Prize Essays on a Congress of Nations* (ib., 1840); William Jay, *War and Peace* (London, 1842); Charles Sumner, *The War System of the Commonwealth of Nations* (Boston, 1845). For the later development of the American movement, consult Julius Moritzen, *The Peace Movement in America* (New York, 1912). Since 1880 the literature of the movement has become extremely voluminous, but the following list includes the most useful recent works accessible in English: Sheldon Amos, *Political and Legal Remedies for War* (New York, 1880); Baroness von Suttner, *Lay down your Arms* (ib., 1894; 2d ed., 1906); W. T. Stead, *The United States of Europe* (ib., 1899); Michael Anitchkow, *War and Labor* (London, 1900); Guglielmo Ferrero, *Militarism* (ib., 1902); J. S. Bloch, *The Future of War in its Technical, Economic and Political Relations*, English translation by R. C. Long (Boston, 1903); Sir Thomas Barclay, *Problems of International Practice and Diplomacy* (ib., 1907); A. T. Mahan, *Some Neglected Aspects of War* (ib., 1907); D. S. Jordan, *The Human Harvest* (ib., 1907); B. F. Trueblood, *The Federation of the World* (3d ed., ib., 1908); Jacques Novikov, *War and its Alleged Benefits* (New York, 1911); H. M. Chittenden, *War and Peace* (Chicago, 1911); L. T. A. Mead, *Swords and Ploughshares* (New York, 1912); W. I. Hull, *The New Peace Movement* (Boston, 1912); C. W. Eliot, *The Road toward Peace* (Boston, 1915); F. F. P. Andrews, *The Promotion of Peace* (ib., 1913); R. N. A. Lane (Norman Angell, pseud.), *The Great Illusion* (4th ed., New York, 1913); N. M. Butler, *The International Mind* (ib., 1913); H. N. Brailsford, *The War of Steel and Gold* (London, 1914); R. N. A. Lane (Norman Angell, pseud.), *The Foundations of International Polity* (ib., 1914); S. L. Gulick, *The Flight for Peace* (New York, 1915). The chief periodicals of the peace movement are the *Advocate of Peace* (Washington), *The Herald of Peace* (London), *The Arbitrator* (ib.), the *Correspondence Bimensuelle* (Bern), *La Paix par le Droit* (Paris), *Die Friedenskarte* (Berlin).

PEACE OF ALAIS. See ALAIS, PEACE OF.

PEACE OF GOD. 1. An attempt of the Church in the latter part of the tenth century and early part of the eleventh century to do away with private warfare. Various synods in France sought to compel persons who were accustomed to bear arms to agree not to use them, but to submit their differences to the judgment of regular tribunals. The method of enforcing these decrees was by spiritual penalties. The whole scheme proved a failure, partly because the nobles loved fighting too well, partly also because there were no tribunals suited to judge differences arising between the nobles. The Church thereupon substituted the so-called Truce of God (q.v.). 2. The term is also used for the peace which the Church imposed regarding consecrated persons, places, and times. War was forbidden against priests, monks, or pilgrims, upon Sabbaths or Church festivals, and upon consecrated ground.

PEACE OF PORTSMOUTH. See RUSSO-JAPANESE WAR.

PEACE OF RYSWICK. See RYSWICK, PEACE OF.

PEACE OF THE PYRENEES. See PYRENEES, PEACE OF THE.

PEACE OF UTRECHT. See UTRECHT, PEACE OF.

PEACE OF WESTPHALIA. See WESTPHALIA, PEACE OF.

PEACE PIPE. See CALUMET.

PEACE RIVER. One of the largest tributaries of the Mackenzie system, in west Canada (Map: Canada, G 5). It rises in the north-central part of British Columbia and flows east through the Rocky Mountains, then northeast through the Province of Alberta until it joins by several arms the Great Slave River at the west end of Lake Athabasca. Its length is about 1000 miles, but, though of navigable depth through most of its course, it is obstructed by a number of rapids. Its valley is fertile.

PEACH (OF. *pesche*, Fr. *pêche*, It. *pesca*, *persica*, from Lat. *persicum*, from Gk. *περσικόν*, *persikon*, peach, neut. sing. of *Περσικός*, *Persikos*, Persian, from *Περσίς*, *Persis*, OPers. *Pārsa*, Persia; so called because the first peaches known to the Greeks came from Persia). A deciduous orchard fruit, believed to have originated in China, where it has been cultivated from very remote times. It was early introduced into Europe by way of Persia; hence its specific name, *Prunus*, or *Amygdalus*, *persica* (family Rosaceæ). The peach is a small, much-branched tree, 15 to 20 feet high, with lanceolate leaves, triplicate buds usually at each node, the two outer of which are flower buds and the middle one a leaf bud, and flowers which usually blossom before the leaves appear. The fruit is a drupe, varying much in size and color of flesh and downy skin. Peaches have been variously

PEACH BLOSSOMS AND LEAVES.

classified. Popularly they are separated into two groups, clingstones and freestones. These two classes gradually merge into each other in the different varieties, and even the same variety may be a clingstone or a freestone in different seasons. Price has classified the nearly 300 varieties of peaches grown in North America into the following five races: 1. Peen-To, a flat, medium-sized, greenish-white, very early peach, suited for commercial culture only in Florida

and some of the Gulf States. 2. South China race; rather small, oval, somewhat flattened fruit, with an extended recurved apex. 3. Spanish or Indian race, fruit late, nearly always yellow, with a hairy down. 4. North China race; fruit large, oval, with slightly recurved beak. 5. The Persian race, which includes the great majority of large, yellow or white fleshed varieties grown in the northern United States. Certain smooth-skinned peaches are popularly called nectarines. They may originate as seedlings or bud variations (sports) and may be propagated and cultivated like other varieties of the peach.

In America peaches are grown in orchards like apples; in England and middle Europe they are usually trained against walls or other protection, cultivated in pots and under glass. The tree is hardy, withstanding a winter temperature of -12° F. to -18° F. Should a few warm days occur in winter and the fruit buds start into growth, they may be easily killed at a much higher temperature. The chief difficulty in peach growing arises from the danger from late spring frosts. The peach, like the almond, blossoms early unless held in check by cool spring weather or some artificial means; hence there is often more difficulty in growing peaches in the South than in the North. These facts tend to confine the commercial culture of peaches to particular localities. In America the peach regions include certain more or less continuous areas from Connecticut to Georgia, local areas in north Florida, the eastern and southern shores of the Great Lakes, much of southern Illinois, parts of Missouri, Kansas, Arkansas, Louisiana, Oklahoma, and eastern Texas, and nearly the whole of California. Of these different peach areas the most widely known are those located in Maryland, Delaware, Georgia, and Michigan.

Peaches are propagated from seed, which is usually stratified with moist sand in the fall and left exposed to the freezing and thawing of winter, which softens and cracks the pits. In spring the pits are planted 6 to 8 inches apart in rows wide enough to admit of horse cultivation, and the following August or September the seedlings are budded with improved varieties, since the peach does not, except in a few instances, reproduce true to seed. (See BUDGING.) In the Southern States the seedlings are often budded in June, and the budded trees are set in the orchard in the fall or following spring. In the North trees budded one fall are allowed to grow the following season before transplanting to the permanent orchard. Peaches thrive best on light, sandy, gravelly, or shaly soils, though larger trees are grown on heavier soils. High or rolling lands are desirable to insure good soil and air drainage, for the peach must be planted in protected localities free from late spring frosts. Early blooming is sometimes delayed by planting on northern or northeastern slopes. Thoroughly whitewashing the trees in fall or winter also has a tendency to delay blossoming. The trees are usually set in the orchard about 20 feet apart each way, though, where careful attention is given to pruning and fertilizing, as in some commercial orchards, they may be set as close as 15 feet apart each way. The peach is not a long-lived tree, even under the most favorable conditions, seldom exceeding 30 years. The life of a commercial orchard is seldom more than seven to nine years.

Peaches are now frequently used as fillers in newly set apple orchards. With proper treatment they materially reduce the cost of bringing the slower-growing apples into bearing. The trees come into bearing about the third year after setting in the orchard. The best peach growers advocate clean cultivation in the orchard up to about the middle of summer, when a cover crop is sown and cultivation stopped. Trees thus treated ripen up their wood better and are less likely to winter-kill than if cultivated longer in the season. Potash and phosphatic fertilizers are most in demand in the peach orchard. By planting leguminous cover crops and turning these under each spring other nitrogenous fertilizers will seldom be required. Barnyard manure is not considered desirable in the peach orchard unless the land is very poor. It affects the quality of the fruit unfavorably and is likely to produce a rank unripened growth of wood.

Commercial peach growers quite generally thin their peaches to stand 5 or 6 inches apart on the branches after the usual "June drop" occurs. Peaches are borne only on wood of the preceding season's growth; hence by carefully heading back this new growth each spring they are really thinned in part at the same time. In heading in it is customary to remove about one-half of the new wood growth of the previous season. In harvesting the fruits are gathered when full grown and well colored, but before they begin to soften, graded according to size, and marketed in various forms of small packages. Besides being extensively used as a desert fruit, peaches are canned in enormous quantities, evaporated, and sold as dried peaches, and also used to some extent in the manufacture of peach brandy. The peach ranks second, as a commercial fruit, in the United States, the production in 1909 amounting to 35,470,276 bushels, valued at \$28,781,078; exports, \$499,549.

Peach Diseases. Among the most serious fungus troubles of the peach are the black spot and the brown or fruit rot. The black spot or scab (*Cladosporium carpophilum*) causes dusky brown or black spots on the side of the fruit. These spots are individually seldom more than $\frac{1}{8}$ inch in diameter, but by coalescence often injure a large area. The tissues underneath become affected and hard, and the peach lopsided, often cracked. The brown rot (*Monilia fructigena*), which also attacks cherries and plums, causes the rotting of all these fruits as they are ripening and is one of the most serious diseases to which they are subject. The affected fruits, which turn brown and appear decayed, soon become covered by an ash-colored coating of spores. The disease spreads rapidly, especially among early varieties. The twigs are also likely to be destroyed, and where the flowers are attacked, which evidence seems to show may happen, no fruit is set. These diseases may be largely prevented by thorough spraying with Bordeaux mixture. (See FUNGICIDE.) The fungicide should be diluted about one-third, because the foliage of the peach is very subject to injury from the copper compounds used in spraying. One of the most injurious fungus diseases of the peach tree and foliage is the leaf curl, due to *Eoascus deformans*. This fungus attacks the leaves, defoliating the tree. Its presence may be ascertained by the occurrence of reddish or yellowish blisters upon the leaves, which become curled or crumpled. This disease

is more prevalent in damp, foggy regions than in dry, airy ones. It can be prevented by applying Bordeaux mixture of full strength to the trees before the buds begin to swell, followed after the leaves appear with a single application of the same fungicide, diluted as above. For spraying peach trees lime-sulphur solution is preferred to Bordeaux mixture, as it is less injurious. Diseases of unknown cause are peach rosette, little peach, and yellows. In rosette the twigs are stunted and the leaves bunched in rosettes. It is mostly confined to the South. The yellows is also shown in the appearance of the leaves. They are narrow, tufted, and of a yellowish color. The fruit ripens prematurely and is streaked through the flesh with red. Little peach resembles yellows, but usually is later in making its appearance. The leaves droop and are reduced in size, and the fruit is smaller and does not ripen normally. These diseases are contagious, and diseased trees should be dug out and burned as soon as discovered. Badly infested regions have been rid of the disease in this way. See ASCOMYCETES; EXOASCUS; PEACH INSECTS. See Colored Plate of DRUPES.

I. Bailey, *Standard Cyclopedia of Horticulture* (New York, 1914 et seq.); H. P. Gould, "Growing Peaches: Sites, Propagation, Planting, Tillage, and Maintenance of Soil Fertility," and "Growing Peaches: Pruning, Renewal of Tops, Thinning, Interplanted Crops, and Special Practices," in *United States Department of Agriculture, Farmers' Bulletin, Nos. 631, 632* (Washington, 1915).

PEACH, VINE. See MUSKMELON.

PEACH'AM, HENRY (c.1576-c.1643). An English author, born at North Mimms, Hertford, and educated at Trinity College, Cambridge. In 1606 he published his first volume, *Graphice, or the . . . Art of Drawing with the Pen and Limning in Water Colors*. That he was a fair draftsman is clear from his illustrations in *Minerva Britannia* (1612), a work on heraldry. After two years of foreign travel he settled in London, made the acquaintance of Ben Jonson and John Selden, and became well known in literary circles. His best-known works are: *The Compleat Gentleman* (1622), of which many editions were published; *The Art of Living in London* (1642); *The Worth of a Penny, or a Caution to Keep Money* (1641, with imprint, 1647).

PEACH INSECTS. The principal enemy of the peach in the United States is the peach-tree borer, which is the larva of a sesiid moth (*Agertia exitialis*). The moth, which has partly transparent wings and closely resembles a wasp, is a day flier. It appears in the northern

PEACH-TREE BORER.

Stages of *Agertia exitialis*: a, adult female; b, adult male; c, cocoon; d, caterpillar.

United States and Canada from about the middle of July to August, in the South much earlier. Its eggs are laid on the bark of the peach tree near the surface of the ground. As soon as the larva has hatched it works downward in the bark to the root, forming a tunnel which soon becomes filled with gum. As the larva increases in size it devours the bark and sapwood, causing an exudation of gum which ultimately makes a thick mass about the base of the tree. Larvæ of different sizes may be found all through the fall and winter months, and the full-grown ones transform into pupæ within podlike cases made from the castings mixed with gum and threads of silk. The pupa state lasts about three weeks or more. This insect is not confined absolutely to peach, but sometimes occurs upon plum, and the presence of the larvæ is readily detected by the exudation of gum, when they may be either removed by hand, or, after some scraping, the application of hot water is effective to some degree. The best remedy, however, consists in protecting the lower part of the trunk of the tree by a band made of stiff paper or straw.

PEACH-TWIG BORER.

a, a new shoot of peach withering from attack of larva of *Anarsia lineatella*; b, the larva (enlarged).

The peach-twig borer (*Anarsia lineatella*) is a moth whose hibernating larvæ injure the trees in early spring, when they bore into the shoots of new leaves, killing the growing terminals and preventing the development of the branch. It is an Old World insect, which has done vast damage on the Pacific coast and somewhat in the East. It also attacks related fruit trees.

The fruit-tree bark beetle (*Scolytus rugulosus*) frequently damages the peach, making small holes like shot holes through the bark. The beetles will lay their eggs by preference in devitalized trees, but will occasionally attack healthy trees. Where this insect is abundant it will be well to girdle one or more trees to be used as traps. The issuing beetles will lay their eggs by preference in the trees thus injured and later they may be cut down and burned.

The San José scale is a serious enemy to the peach (see SAN JOSÉ SCALE), while the peach-tree bark louse (*Leconium persicæ*) is another scale-insect enemy of this tree. The leaves are attacked by the New York weevil (*Ichthyocerys noveboracensis*) and by the peach-tree leaf roller (*Ptycholoma persicana*) as well as by the larva of *Callimorpha lecontei*. Spraying with an arsenical poison is a remedy against these insects. The peach-tree aphid (*Myzus persicæ*) and the black peach aphid (*Aphis persicæ-niger*) are the only other enemies of any importance. These are combated by kerosene emulsion.

Consult: William Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889); A. L. Quaintance, *Papers on Deciduous Fruit Insects and Insecticides* (Washington, 1912); Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914); and the publications of the United States Department of Agriculture, Division of Entomology.

PEACHTREE CREEK, BATTLE OF. A battle fought on July 20, 1864, near Atlanta, between a part of the Federal army under Gen. W. T. Sherman and a part of the Confederate Army of the Tennessee under Gen. John B. Hood. Gen. Joseph E. Johnston had foreseen that General Sherman would probably divide his army in the neighborhood of Atlanta and had planned to attack at Peachtree Creek, less than 10 miles north of Atlanta, and, if repulsed, to fall back to intrenchments nearer the city. When General Hood succeeded General Johnston, on July 18, he adopted the plan and ordered General Hardee and Gen. A. P. Stewart to attack the Federal right, consisting of the Army of the Cumberland under Gen. George H. Thomas, while crossing the stream, July 20. General Cheatham was to prevent General McPherson from coming to the aid of General Thomas. The attack was ordered to be made at 1 P. M., but was delayed until 4 P. M., by which time the Federal troops had crossed and thrown up rough intrenchments. The artillery was well handled, and a furious attack was repulsed with great slaughter. Meanwhile General McPherson had advanced more rapidly than was expected and drove his vanguard sharply in upon Hood's right flank. General Hood withdrew General Cleburne's division from General Hardee to oppose him, and a further attack was useless. The Federal troops engaged amounted to 21,655 and the Confederate to 20,250. The Federal loss in killed, wounded, and prisoners was some 2000; the Confederate, 2500. The result of this battle was to hasten the fall of Atlanta. Consult Johnson and Buel (eds.), *Battles and Leaders of the Civil War*, vol. iv (New York, 1901).

PEA'COCK (from *pea*, AS. *pawa*, from Lat. *pavo*, peacock, connected with Gk. *raús*, *taos*, Pers., Ar. *taivus*, *taus*, peacock + *cock*, AS. *coc*, Bret. *kok*, Alb. *cocos*, Skt. *kukkuta*, cock, onomatopoeitic in origin), or PEA'FOWL. A kind of pheasant, of which only two species are known, natives of Asia and the East Indies; birds of a large size and somewhat remarkable for magnificence of plumage. The bill is of moderate size, somewhat arched towards the tip; the cheeks nearly naked; the head crested; the tarsi rather long and armed with a single spur; the wings short; the upper tail coverts prolonged far beyond the tail and forming a splendid train capable of being erected and spread out into a great disk, the true tail being at the same time erected to support it. The common peacock

(*Pavo cristatus*) has for crest an aigrette of about 24 upright feathers, with slender almost naked shafts and broad tip. The tail consists of 20 brown stiff feathers in the peacock and 18 in the peahen. They measure less than 20 inches in length. The train derives much of its beauty from the loose barbs of its feathers, while their great number and unequal length contribute to its gorgeousness, the upper feathers being successively shorter, so that when it is erected into a disk the eyelike or moonlike spot at the tip of each feather is displayed. The blue of the neck; the green and black of the back and wings; the brown, green, violet, and gold of the tail; the arrangement of the colors, their metallic splendor, and the play of color in changing lights, render the male peacock an object of universal admiration—a sentiment in which the bird himself seems to participate, as he struts about to display himself. When the train is erected, the peacock has the power of rattling the shafts of its tail feathers against one another in a very peculiar manner by a strong muscular vibration. The peahen is much smaller than the adult male bird, has no train, and is of dull plumage, mostly brownish, except that the neck is green. In captivity individuals with white plumage not infrequently occur, in which even the eyelike spots of the tail are but faintly indicated; and pied peacocks have the deep blue of the neck and breast contrasted with pure white. The "japanned peacock" (*Pavo nigripennis*) is probably a true mutant, occurring, or at least surviving, only in a captive state. It has deep-blue wing coverts, the female is grayish white, and the chicks are pure white.

The peacock is generally supposed to have been known to the Hebrews in the time of Solomon, but it is not certain that the word commonly translated "peacocks" in the account of Solomon's importations from Tarshish (2 Chron. ix. 21) does not signify *parrots*. It is commonly stated that it first became known to the Greeks on the occasion of Alexander's expedition to India, but Aristophanes mentions it in plays written before Alexander was born. It has taken a considerable part in the folk lore and religious history of most peoples familiar with it. It is regarded as sacred by various Indian castes, was made the emblem of certain classic divinities, and its plumes are still thought "unlucky" by many persons. The peacock became common among the Greeks and Romans; a sumptuous banquet in the latter days of Roman greatness was scarcely complete without it; and wealth and folly went to the excess of providing dishes of peacocks' tongues and peacocks' brains. Throughout the Middle Ages, also, a peacock was often presented at the tables of the great on state occasions, the skin with the plumage being placed around the bird after it was cooked.

The peacock is now common in most parts of the world; generally kept, however, except in warm countries, for ornament rather than profit, although both the flesh and the eggs are very good. It readily partakes of all the ordinary food provided for the poultry yard and is fond of buds and succulent vegetables. It is hardy enough even in cold climates, except that few eggs are laid and the young are difficult to rear. The adult birds sit on trees or on the tops of houses or stacks during the keenest frosty nights, never, if they can avoid it, submitting to the confinement of a house. A sketch of its

history in civilization will be found in Stallybrass' English translation (London, 1891) of Hehn's work entitled *Cultivated Plants and Domestic Animals in their Migrations*. Peacocks are found wild in almost all parts of India and Ceylon. In general habits they resemble other pheasants. They roost at night in trees for safety, but find their food and make their nests on the ground. When alarmed on the ground in early morning with its plumage still wet with dew, the bird cannot readily take wing and is sometimes run down by dogs or by horsemen. The female lays about 10 eggs, dirty brown in color.

The other species is the green or Java peacock (*Pavo muticus*), a native of Burma, the Malay Peninsula, and Java. It is nearly equal in size to the common peacock, but of perhaps more brilliant although very similar plumage. The cheeks and around the eyes are yellow, the neck and other fore parts greenish with golden reflections. The crest is longer than that of the common peacock, its feathers less equal and webbed along their whole length. Except for the lack of a train, the female closely resembles her mate. On the basis of the sequence of tail molt Beebe has recently established a trenchant character for the subfamily Pavoninae. Consult the works of Jordan, Hume, Oates, Legge, Seebohm, Blyth, and other writers on East Indian ornithology, also Angelo de Gubernatis, *Zoological Mythology. Legends of Animals* (2 vols., New York, 1872); Charles De Kay, *Bird Gods of Ancient Europe* (ib., 1898); Charles Darwin, *Variation of Animals and Plants under Domestication* (authorized ed., 2 vols., ib., 1900); for the most complete account, C. W. Beebe, *Monograph of the Pheasants* (London, 1915). See Plate of PEACOCKS, ETC.

PEACOCK, SIR BARNES (1810-90). An English judge. Called to the bar at Lincoln's Inn in 1836, he gained a great reputation as a lawyer by successfully defending Daniel O'Connell (q.v.) in 1844. He became a legal member of the Supreme Council of India in 1852, served as Chief Justice at Calcutta in 1859-70, and was appointed a member of the judicial committee of the Privy Council in 1872. Peacock was knighted in 1859.

PEACOCK, GEORGE (1791-1858). An English mathematician and divine, born at Thornton Hall, Denton. He was educated at Richmond and at Trinity College, Cambridge, where he became second wrangler (1813), fellow (1814), and tutor and lecturer (1815). He was a fellow student with Herschel, Babbage, and Woodhouse. These four translated Lacroix's *Differential and Integral Calculus* (1816) and were instrumental in the introduction of the continental notation of the calculus into Cambridge. In 1837 he was elected Lowndean professor of astronomy at Cambridge, which office he retained until his death, although he soon treated it as a sinecure. In 1839 he became dean of Ely and removed thither. Peacock was one of the founders of the Cambridge University Philosophical Society (1819), was a fellow of the Royal Astronomical and Geological societies and was connected with other societies. In 1838 and 1843 he was a member of the commission for standard weights and measures and advocated a system of decimal coinage. In 1850 he was a member of the royal commission and in 1855 of the parliamentary commission for drawing up new statutes for the university and col-

leges. His principal mathematical works are: *A Collection of Examples of the Application of the Differential and Integral Calculus* (Cambridge, 1820); contributions to the *Encyclopædia Metropolitana* (1825-26); *A Treatise on Algebra* (Cambridge, 1830; 2d ed., 2 vols., 1842-45); *Report on the Recent Progress and Present State of Certain Branches of Analysis* (British Association Reports, 1834); *Remarks on Decimal Nomenclature of Coins, Weights, and Measures* (1841). He also wrote the *Life of Thomas Young, M.D.* (London, 1855).

PEACOCK, THOMAS LOVE (1785-1866). An English novelist and poet. He was born at Weymouth, Oct. 18, 1785, and, his father dying soon afterward, was educated in a somewhat desultory fashion at home and at a private school until he was 13. He made his first publication, in poetry, before he was 20. In 1812, on one of his tours in Wales, he made the acquaintance of Shelley and his wife, Harriet, and for several years this friendship was the most notable thing in his life. Shelley made him his executor, with Byron, and it is to him that we owe our best materials for the poet's biography. In 1816, by the publication of *Headlong Hall*, Peacock "took his station and degree" in literature. Three years later he obtained an important position under the East India Company and with James Mill was appointed one of the examiners of Indian correspondence. He continued at India House for 38 years, succeeding Mill as chief examiner in 1836. Finally he retired on an ample pension, to live thenceforth quietly with his books and his garden at Halliford on his beloved Thames. His death occurred Jan. 23, 1866.

Though the charming ballads scattered throughout his books evidence his poetic ability, it is as a satirist that Peacock will be remembered. To Shelley he described *Maid Marian* (written 1818, published 1822) as "a comic romance of the twelfth century, which I shall make the vehicle of much oblique satire on all the oppressions that are done under the sun"—a phrase which, if we widen it to include the oppressions of cant and ignorance, is not a bad summary of the most of his work. In the ordinary qualifications of the novelist—plot construction, human interest, character drawing—he is deficient. But in genial satire (aided by a real passion for beauty and a singularly pure and elegant style) he has had few equals in English literature, in fact, his fiction has been not inaptly called the best modern representative of the Aristophanic comedy. His characters, despite their suggestion of Shelley or Coleridge or Canning, are rather types than real people; like Ben Jonson and his school, he presents "humors" in preference to men. His other books are: *Melincourt* (1817); *Nightmare Abbey* (1818), the best known, with *Headlong Hall*; *The Misfortunes of Elphin* (1829); *Crotchet Castle* (1831), which contains his highest comedy; *Paper Money Lyrics and Other Poems* (1837), *Gryll Grange* (1861), the mellow product of his old age. His principal works were published in collected editions in 1875 (ed. Sir Henry Cole) and 1891 (ed. Garnett), with valuable critical and biographical matter. Consult: G. E. Santsbury, in *Essays in English Literature, 1780-1860* (1st series, London, 1890); *Peacock's Memoirs of Shelley with Shelley's Letters to Peacock*, edited by H. F. B. Brett-Smith (ib., 1909); Carl Van Doren, *Life*

PEACOCK FISH. A gorgeous European wrasse (*Ctenilabrus pavo*).

PEACOCK ORE. See BORNITE.

PEACOCK PHEASANT. A pheasant, closely allied to the argus pheasants, of the genera *Polyplectron* and *Chalcurus*, of which several species inhabit the Indo-Chinese region and the neighboring islands. The best-known species is *Polyplectron chinquis* or *bicalcaratus*, which is brown with a black head and has the upper plumage adorned with large ocelli resembling those of a peacock's tail. They frequent the forests of hilly regions. The female has the peculiar habit of using her large tail as a shelter for her young. These birds have two great spurs upon the tarsus. Six forms have been recognized. The bronze-tailed peacock pheasants (*Chalcurus*) are two in number, living in the Malay Peninsula and Sumatra. They are more generalized in plumage than the members of the other genus, with the spots fewer and more diffuse. See Plate of PHEASANTS.

PEA CRAB. See OYSTER CRAB.

PEA INSECTS. There are about 20 species of insects which are more or less injurious to peas. The pea weevil (*Bruchus pisorum*) is very abundant. It probably originated in Oriental regions, although some authors give North America as its native home. It is now generally found wherever peas are cultivated except in the colder countries of Europe and Canada and is very abundant throughout the United States—so abundant, in fact, that in eating green peas we consume a larva or grub with nearly every pea. The beetles appear on the vines when the peas are in blossom, and the eggs are deposited singly upon the surface of the pods. The larva bores through the pod into a pea and when full-grown transforms to pupa, the adults issuing at varying periods from the end of July until late in the autumn, frequently in the Northern States remaining in the pea until the following spring, when many are planted in the seed. The insect hibernates in the adult condition and has only a single generation each year. It does not breed in dried peas, and the new generation for another year is dependent upon the beetles which are contained in planted seed or which escape from the storeroom. The simplest and most effective remedy consists in holding seed peas in a closed receptacle over one year: the beetles which issue die without being able to lay their eggs in the field. Late planting is also frequently effective, and weevilly peas may be made safe by fumigation with bisulphide of carbon.

Certain of the blister beetles are frequently injurious to both beans and peas by devouring the leaves, particularly the ash-gray blister beetle (*Macrobasis unicolor*), which also feeds upon other leguminous plants. The beetles are abundant in June and July and may be controlled by spraying with Paris green or by driving them in the early morning into windrows of straw or hay, where they are burned. In their early stages these insects are beneficial by destroying the egg pods of grasshoppers. The maturing pods of peas and cowpeas and other leguminous plants are frequently damaged by the bollworm or corn-ear worm (larva of *Heliothis obsoleta*); and the young plants as they come from the ground are frequently damaged by cutworms

and other caterpillars. (See CUTWORM; OWLET MOTH.) The European pea moth (*Semasia nigricana*) has been introduced into Canada, where it has injured peas for a number of years. It is probably only a question of time when it will make its appearance in the northern United States. A plant bug (*Halticus citri*) damages peas and beans in some of the Central States, and several species of leaf hoppers infest the plant.

The most serious enemy to the pea crop of recent years has been the destructive green pea aphid (*Macrosiphum pisi*), which caused a loss of many hundreds of thousands of dollars to pea growers in the United States during 1899 and 1900. Prior to that time, and since, it has not been such a serious pest. During the first season of its abundance it overran and laid waste fields of peas from Nova Scotia and Maine to Virginia and Maryland, as well as in neighboring States, destroying about 50 per cent of the crop. The loss during 1899 was estimated at \$3,000,000, and during 1900, as early as June 15, at \$4,000,000. In Europe, also, it is destructive of peas, clovers, vetches, and related plants. The insect multiplies with great rapidity and in favorable seasons is always likely to do enormous damage. The remedies which have been employed are spraying with kerosene soap emulsion and the use of the brush and cultivator method. In the latter case the peas have been grown in rows sufficiently wide apart to admit of a one-horse cultivator, and the lice are brushed from the plants with boughs of pine, the cultivator following immediately afterward and burying the lice. Early planting and

GREEN PEA APHIS.

a, winged female of *Macrosiphum pisi* in feeding position; b, wingless female.

very late planting have also been advised, but rotation of crops by which no leguminous crop immediately follows another one offers apparently the best chance of immunity. Consult: F. H. Chittenden, *Insects Injurious to Beans and Peas* (Washington, 1898); id., *The Destructive Green Pea Louse* (ib., 1901); id., *Insects Injurious to Vegetables* (New York, 1907).

PEAKE, ARTHUR SAMUEL (1865-). An English biblical scholar, born at Leek, Staffordshire, and educated at St. John's College, Oxford. In 1890-92 he was a lecturer at Mansfield College (Congregational), Oxford, and from 1890 to 1897 was fellow of Merton College. In 1895-1912 he served as lecturer in the Lancashire Independent College, from 1904 to 1912 also in the United Methodist College at Manchester. In 1892 he had become tutor in the Manchester Primitive Methodist College and in 1904 Rylands professor of biblical exegesis in Victoria University. The University of Aberdeen made him an honorary D.D. in 1907. Among Dr. Peake's publications are: *A Guide*

to *Biblical Study* (1897), commentaries on Hebrews (1902; Century Bible), Colossians (1903; Expositor's Greek Testament), Job (1905; Century Bible), Jeremiah (1910-12; ib.), and Isaiah xl-lxvi (1912); *The Problem of Suffering in the Old Testament* (1904); *The Religion of Israel* (1908); *Critical Introduction to the New Testament* (1909); *Heroes and Martyrs of Faith* (1910); *The Bible: Its Origin, Significance, and Abiding Worth* (1913).

PEALE, pēl, CHARLES WILSON (1741-1827). An American portrait painter. He was born at Chesterton, Md., April 16, 1741, was apprenticed as a boy to a saddler in Baltimore, in which city he received some slight instruction in painting from Hesselius, an English painter. In 1768-69 he studied with Copley in Boston and in 1770 went to London, where he was a pupil of Benjamin West. West, when Peale's funds gave out, received him into his own house. In 1774 he returned to America and practiced portrait painting at Annapolis, but two years later he removed to Philadelphia. During the Revolution he commanded a company at Trenton and Germantown and painted the portraits of many prominent officers. Of Washington Peale painted 14 likenesses, the earliest of which represents him in the uniform of a Virginia colonel and is the only one surviving of those painted before the Revolution. The most notable one, ordered by Lafayette for the French King, was purchased during the French Revolution and presented to the National Gallery, at Washington, where it is still preserved. Another portrait of Washington was painted in 1780 for Princeton College; another still is in the Metropolitan Museum, New York. Other portraits include those of Generals Lincoln, Greene, Rochambeau, Reed, Gates, and De Kalb, as well as Jefferson, Jackson, and Clay. His portrait of Hamilton is in the New York Historical Society, which also possesses an interesting portrait group of the artist and his family, one of his last works. At 81 years of age he painted "Christ Healing the Sick," and two years later a good full-length portrait of himself, now in the Pennsylvania Academy. Peale was a man of very versatile talents. In 1785 the discovery of the bones of a mastodon gave him the idea of founding a museum. It contained a variety of specimens, chiefly of natural history, upon which he discoursed learnedly. He was instrumental in founding (1805) the Pennsylvania Academy of the Fine Arts, the first of its kind in the United States. As a painter he was the best in his country from the departure of Copley (q.v.) for England until the return of Gilbert Stuart (q.v.) in 1793. His early style was stiff and archaic, resembling Copley's, but these qualities were softened under the instruction of West. To modern eyes his pictures seem wooden in design and harsh in color. Of his 11 children who were named after famous artists, three distinguished themselves in art. REMBRANDT (see below) was the most famous; RAPHAËLE (1774-1825) was one of the first American painters of still life; TITIAN (1800-85) made drawings of animals. JAMES PEALE, brother of Charles Wilson, was best known as a miniaturist, in which branch he did good work. Consult: Dunlap, *History of the Arts of Design in the United States* (New York, 1834); E. B. Johnston, *Original Portraits of Washington* (Boston, 1882); Samuel Isham, *History of*

American Painting (New York, 1910). See Plate of FRANKLIN, BENJAMIN.

PEALE, PATRICK. See SECKENDORF, GUSTAV ANTON VON.

PEALE, REMBRANDT (1778-1860). An American portrait and historical painter and author. He was born in Bucks Co., Pa., Feb. 22, 1778, the son and pupil of Charles Wilson Peale. From 1796 to 1801 he practiced portrait painting in Charleston, S. C., and then went to London, where he studied under West, returning to the United States in 1803. In 1807 and again in 1809 he visited Paris, where, according to his own statement, the painter David sat to him for a portrait, pressed him to remain, promising him all the Imperial portraits. Among other sitters in Paris was Denon, director general of the state museums. In 1810 he returned to America and practiced portrait painting at Philadelphia, New York, Charleston, and at Baltimore, where he established a museum and picture gallery. In 1829 he went abroad again, visiting France and Italy, and in 1833 he established himself in London, returning afterward to the United States. Peale painted several portraits of Washington, the most notable of which, executed in 1823, was exhibited in Rome, Florence, and London and was bought by Congress upon his return to America in 1832. His other works include the "Court of Death" (1820, Detroit Art Gallery), the "Roman Daughter" (1810, Boston Museum), and the "Ascent of Elijah"; portraits of Gilbert Stuart, Thomas Jefferson, and Mrs. Madison (New York Historical Society), of Cuvier and Houdon (Pennsylvania Academy), and an equestrian portrait of Washington (Independence Hall, Philadelphia). Owing to his French experience his work was more accurate in drawing than that of most of his contemporaries, but the color is dull and the style less vigorous than his father's. He was also a skillful lithographer and in 1827 won a silver medal at the Franklin Institute for a portrait of Washington. He lectured on natural history and is the author of *An Account of the Skeleton of the Mammoth* (London, 1802). His other books include: *Notes on Italy* (Philadelphia, 1831); *Graphics* (1841); *Reminiscences of Art and Artists* (1845). He died in Philadelphia, Oct. 3, 1860. Consult C. E. Lester, *The Artists of America* (New York, 1846).

PEAN, pēn (OF. *pane*, *panne*, Fr. *panne*, skin, fur, from ML. *panna*, *penna*, skin, from Lat. *pannus*, cloth, or *penna*, feather). One of the furs borne in heraldry (q.v.).

PÉAN, pā'ān', JULES EMILE (1830-98). A French surgeon. He was born at Marboué, near Chateaudun, Eure-et-Loire, and after graduating in medicine at the University of Paris (1860) was at once appointed prosecteur. As hospital surgeon from 1868 to 1892 he was attached to the hospitals of the Enfants Assistés, Loucine, Saint-Antoine, and Saint-Louis. At the end of this period he resigned to open a private hospital. In 1885 he became a member of the Académie de Médecine. Péan was one of the greatest of French abdominal surgeons—he was the first in France successfully to perform ovariectomy (1864), was one of the earliest continental followers of Lister, and the first to introduce into France vaginal extirpation of the uterus and its annexa, etc. He also invented several important surgical and gynecological instruments. Besides editing volumes ii-iv of the second edition of Nélaton's *Elements de*

pathologie chirurgicale (1872), he wrote: *De la scapulargie et de la résection scapulo-humérale* (1860); *Ovariectomie et splénotomie* (1869); *Hystérotomie* (1873); *Leçons de clinique chirurgicale professée à l'Hôpital Saint-Louis* (9

Feeding Value. Peanuts are used as a forage crop and as hay. The ripe nuts and the cake which remains after the oil is expressed are also fed. The percentage composition of a number of peanut products follows:

COMPOSITION OF PEANUT KERNELS, FORAGE, ETC.

	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
Peanut kernels	7.9	27.2	45.2	13.1	3.9	2.6
Peanut vines (green)	31.9	7.4	3.4	27.1	22.0	8.2
Peanut hay	7.8	10.8	1.7	43.6	20.4	15.7
Peanut hulls (shells)	12.9	6.3	2.3	16.9	58.6	3.0

vols., 1879-95); *Diagnostic et traitement des tumeurs de l'abdomen et du bassin* (1880-99).

PEANO, PÀ-R'NÒ, GIUSEPPE (1858-). An Italian mathematician. After serving more than five years as assistant professor, in 1896 he became professor of integral calculus at the University of Turin. In 1908-10 he was also professor of differential calculus at the Reale Politecnico of Turin. His publications include: *I principii di geometria logicamente esposti* (1889); *Notations de logique mathématique—Introduction au formulaire de mathématique publié par la "Rivista de matematica"* (1894); "Saggio di calcolo geometrico," in the *Atti della Reale Accademia delle scienze di Torino* (1896); *Formulaire de mathématiques* (1901).

PEANUT (*Arachis hypogæa*). An annual plant of the family Leguminosæ, also called groundnut, earthnut, ground pea, goober, and pindar in various localities. It grows from 1 to 2 feet high, with thick, greenish, hairy stems and spreading branches. After the petals have fallen the peduncle bends downward and pushes into the ground, where the fruit or pod develops. The pods are pale yellowish, wrinkled, slightly curved, often contracted in the middle, and contain from one to three seeds. The peanut is thought to be a native of Brazil, where a number of species of the genus are indigenous. Soon after the discovery of South America it was introduced into the Old World and is now grown in all the warm regions of the globe. Only since 1866 has it been an important crop in the United States, where it is mainly grown in the Southern States, particularly Virginia, North Carolina, Georgia, and Tennessee. The conditions best suited to the culture of the peanut are an early and warm spring, a hot summer free from drought, and a limy, sandy, friable loam. Lime in some form must be added to soils deficient in this element. The soil is finely pulverized from 4 to 5 inches deep and the seed planted about 1 inch deep in rows from 28 to 36 inches apart and from 12 to 16 inches in the row, when danger of late spring frosts has passed. About two bushels of nuts in the pod are required to plant an acre. After planting and during the growing period of the crop the soil is kept loose and open and free from weeds. The crop is harvested before frost in the fall, the plants being loosened by means of a special plow, then taken up and put into shocks. After drying from 15 to 20 days the pods are picked. Fifty bushels of pods and from one to two tons of hay or straw per acre is considered a good yield. In special establishments known as recleaners or factories the pods are polished and sorted before being put upon the market.

Peanut kernels resemble other leguminous seeds in being rich in protein. The fat content is also high. Since peanut hay is apt to contain considerable dirt, it should be fed from low mangers or troughs. If immature pods are left on the vines, no other food is necessary during the winter. It has been estimated that pigs under 100 pounds would make from \$12 to \$20 worth of pork from an acre of peanuts if fed a moderate allowance of corn or corn meal in addition. Pasturing pigs has the advantage that the animals gather the crop and save the cost of harvesting. Peanuts make a soft pork and lard, a disadvantage that may be overcome by feeding corn exclusively for a month before slaughtering. Peanut cake mixed with less concentrated feeds has been found to be a useful cattle food. A material called "peanut meal" is made by grinding peanut hulls, immature peanuts, and those of an inferior grade.

Production and Use as Food. The production of peanuts in the United States showed a marked increase in 1909, the latest census year, having been 19,415,000 bushels against 11,964,000 in 1899. The value of the 1909 crop was \$18,272,000 against \$7,280,000 in 1899. The exports in 1914 were 8,055,000 lbs., valued at \$421,367. Many nuts are now used in the manufacture of confectionery and peanut butter. The latter is prepared by grinding the nut and generally mixing it with a little water. Peanut oil is made in large quantities in Europe from African-raised nuts. The shelled nuts contain 30 to 50 per cent of oil, which, if carefully made, is of good flavor and is used for various culinary purposes and in the arts. The peanut is at present used more as a luxury or for eating at odd times than as a staple article of diet. It is, however, wholesome, nutritious, and cheap. Little is definitely known concerning its digestibility. It is apparently more easily digested if eaten with other foods than if eaten alone. Attempts to introduce peanut soups, cakes, etc., into the diet have not proved very successful. Consult: W. N. Roper, *The Peanut and its Culture* (Petersburg, Va., 1905); L. H. Bailey, *Cyclopedia of American Agriculture*, vol. ii (New York, 1907); W. R. Beattie, *The Peanut*, United States Department of Agriculture, *Farmers' Bulletin No. 431* (Washington, 1911). See Plate of LEXEMES.

PEA ORE. A form of compact brown or red hematite, consisting of round smooth grains, from the size of mustard seed to that of small peas. Sometimes the grains are still smaller and flattened. The Clinton iron ore, found in the Silurian of the eastern United States, is often of this nature.

PEAR (AS. *peru*, *pere*, from Lat. *pirum*, pear,

pirus, pear tree; connected with Gk. *ἄριος*, *apios*, pear). A deciduous orchard fruit (*Pyrus communis*) of temperate climates, belonging to the rose family, a native of Europe, early introduced into America. This species is the parent of thousands of cultivated varieties. The small apple-shaped, gritty sand or Chinese pear (*Pyrus sinensis*) is seldom grown except for ornament and as a stock, the fruit being inedible unless baked or preserved. Some hybrids between these two species have arisen, two of which, Le Conte and Kieffer, are among the most important commercial varieties grown in America. Pear orchards resemble apple orchards in appearance, except that the trees naturally grow much more erect and pyramidal. When left to themselves they frequently grow to a height of 60 feet or more. Pear flowers are usually white and borne on spurs that continue to bear fruit and to branch for years. The fruit is a pome, more juicy and melting or buttery than the apple and less tart. It is one of the best dessert fruits and is extensively used for canning, preserving, etc., and in some parts of Europe large quantities are used in the production of cider or perry.

While pears are grown over a wide territory in the temperate zones, the countries of largest production are France and the United States. In America they stand fourth in importance among the orchard fruits. According to the thirteenth census the production in the United States in 1909 was 8,840,733 bushels, worth \$7,910,000. The best American pear districts are found in the Northeastern States, from New England west to the Great Lakes, and in California and parts of Oregon and Washington. Blight seriously interferes with pear growing in the Middle West and South, while in the Northwest only the inferior Russian sorts are hardy enough to thrive. Such hybrid varieties as Le Conte, Kieffer, Garber, etc., are less subject to blight. They are productive and well adapted to a wide range of country, extending from New Jersey southward to Florida and Texas.

The pear is grown in orchards, either as a standard or dwarf. Standard trees are produced by grafting or budding the variety which it is wished to grow upon a seedling pear; the best stock for the purpose is obtained by growing the seed of the wild pear of Europe. Dwarf trees are produced by grafting or budding on quince stock. Pears thus treated seldom grow more than 12 to 15 feet high. They come into bearing earlier than standard trees, usually within four years from planting in the orchard, and are especially valuable where land is expensive or for planting between other trees. Frequently dwarfing increases the size of the fruit and improves its quality.

The best soil for standard pears is a well-drained heavy clay loam. Dwarf pears will do well on lighter soils. Rapid growth is not sought for in pear culture, since it is believed to favor the attacks of blight. For this reason, stable or any other nitrogenous manures are not advocated for the pear orchard except on very poor soils. Trees are set in the orchard when two or three years from the bud, standard trees from 18 to 25 feet apart each way and dwarfs 10 to 16 feet. Dwarf trees are set deep, 4 to 6 inches below the union, to prevent growth of the stock and to lessen the danger from breaking off in storms. Cultivation is practiced

only during the spring and early summer in order to prevent a late, sappy wood growth. Recent investigations have clearly shown that many varieties of pears are self-sterile and must be planted with other varieties to cross-pollinize them in order to produce fruit. Such varieties should therefore never be planted in orchards alone. It is probable that almost any variety blossoming at the same time as these self-sterile sorts may be used as pollinizers. In the orchard one or two rows of one variety should be alternated with one or two rows of another variety blossoming at the same time.

Pears are harvested before they are fully ripe and while they are still hard. Thus handled they acquire a better color and flavor, develop less grit in the flesh, and are less likely to decay at the core than when allowed to ripen on the tree. After picking they are stored in shallow boxes or racks in a cool room away from all drafts of air, which tend to shrivel up the fruit. Late winter pears may be left on the trees as long as practicable before frost. Pears grown for market are gathered and placed in barrels or boxes at once. European and California fancy pears are wrapped in paper like oranges before marketing. In recent years the United States has developed a considerable export trade in fresh pears; \$1,402,924 worth were exported in 1914.

Pear Diseases. The pear and its fruit are subject to the same diseases as the apple, for the description and prevention of which see **APPLE, Diseases**. In addition there are two diseases which, although occurring upon the apple and quince, are so much more frequent upon the pear as to be generally associated with it. The first is the leaf spot, due to the fungus *Entomosporium maculatum*, which occurs upon the leaves, fruits, and young twigs—upon the leaves as reddish-brown spots which coalesce more or less and destroy the leaf, sometimes defoliating the tree; upon the stems black, as dead spots; upon the fruit reddish spots beneath which the tissues become hard and cork-like, the fruit often cracking and rotting as a result of the attack. This disease may be easily controlled by the application of Bordeaux mixture or other fungicide (q.v.). The second is pear blight or fire blight (q.v.).

PEAR, PRICKLY. A species of cactus. See **PRICKLY PEAR**.

PEAR BLIGHT. See **FIRE BLIGHT**.

PEARCE, pērs, CHARLES SPRAGUE (1851-1914). An American figure and historical painter, born in Boston. He studied under Bonnat in Paris, lived most of his life in France, and was a frequent exhibitor at the Salon. He was one of the first members of the Society of American Artists, an associate of the National

Academy, an Officer of the Legion of Honor, and a member of several foreign orders. He received numerous gold medals and the grand diploma at Berlin (1894). His earliest paintings are historical pictures, such as "The Beheading of John the Baptist" (Chicago Art Institute). Later he chose modern subjects with a preference for the shepherdesses and peasant girls of Picardy. His works are in the realistic French manner, harmonious in tone, with notable technical qualities and skill in composition and draftsmanship. Among the best known are: "The Shepherdess" (1866); "Across the Common" (Buffalo Academy); "Fantaisie" (Pennsylvania Academy); and "Meditation" (Metropolitan Museum, New York). He did some mural painting in the north hall of the Congressional Library in Washington.

PEA RIDGE, BATTLE OF. A battle of the Civil War in America, fought at Pea Ridge in northwest Arkansas, near the Missouri boundary, March 7 and 8, 1862. In January, 1862, Gen. S. R. Curtis with 10,500 Federal troops, composing the Army of the Southwest, moved against Gen. Sterling Price, commanding Missouri State troops at Springfield. General Price retired into Arkansas, where he was joined by Gen. Benjamin McCulloch with his division, and General Van Dorn took chief command. General Curtis followed and took a strong position at Pea Ridge, on an eminence in the Ozark Mountains, and awaited an attack. General Van Dorn advanced with 14,000 men and was joined by Gen. Albert Pike with a brigade of Indians, which had been recruited in Indian Territory. His plan was to strike the rear of the Federal army and cut off its communications. General Curtis had changed front, but the Federal right was driven back 2 miles on March 7. The attack by the Confederates on the Federal left was repulsed with great slaughter, Generals McCulloch and McIntosh being among the killed. The Indians were entirely useless and scattered at the beginning of the artillery fire. The next morning General Van Dorn retreated under cover of his artillery, but General Curtis drew his men into an arc of a circle and poured in a destructive cross fire. The Federal loss was 1384 killed, wounded, and prisoners; the Confederate was given at 800 exclusive of Indians, but was undoubtedly larger. The result of this first victory west of the Mississippi saved Missouri to the Union cause. This encounter was known to the Confederates as the battle of Elkhorn.

PEAR INSECTS. The insects attacking the pear are identical in many instances with those which attack the apples, the apple borers, the San José scale, the oyster-shell bark louse, and the codling moth all being found to attack the pear. The pear-tree psylla (*Psylla pyricola*) is confined to the pear and is common and rather destructive in the northern United States, extending westward as far as Michigan and southward to Maryland and Virginia. It was imported about 1832 from Europe, where it occurs abundantly, especially in Austria. The orange-yellow eggs are laid by the adult insect upon the leaves of the trees, and the young insects, yellow in color with crimson eyes, begin immediately to suck the sap from the leaf. It grows rather rapidly and has several generations (four or five) in the course of a summer. It hibernates in the adult condition in crevices on the trunk of the tree or under leaves on the

ground. It is preyed upon by a large number of natural enemies, principally by the golden-eyed lacewing flies and the larvae of coccinellid (or ladybird) beetles. The best remedy is a

PEAR PSYLLA.

Psylla pyricola: adult; an egg (a); and larva (b) from beneath. Greatly enlarged.

spring application of kerosene emulsion spray when the leaves are first unfolded. A combination of kerosene emulsion and Bordeaux mixture is recommended where pear blight occurs in the same orchard.

A bark-boring beetle, known as the pear-blight beetle (*Xyleborus dispar*), frequently causes the death of many twigs of the pear tree by making small perforations at the bases of the buds. The adult beetle deposits its egg on the bud, and the young larva bores down, following the course of the eye of the bud, towards the pith, around which it passes, consuming the tissues in its course, thus interfering with the circulation and causing the twig to wither. The adult insect issues in June or July and deposits its eggs during August. The only remedy which has been suggested is to cut off the blighted limbs below the injured part and burn them before the beetle has escaped. Another borer, the sinuate pear borer (*Agilus sinuatus*), has been introduced into the United States from Europe within recent years. This borer in the larval condition feeds between the bark and wood in pear trees, especially in the trunk and larger branches, making long zigzag galleries, finally girdling the tree and killing it. It lives two years in the larval condition.

Among the numerous insects which attack the leaves of the pear is the so-called pear slug,

PEAR SLUG.

a, adult sawfly, female; b, larva with slime removed; c, larva in normal state (the slug); d, an affected leaf; e, cocoon.

which is the larva of a sawfly (*Eriocompoides limacina*). The adult is a small insect, smaller than the house fly and glossy black in color. It was probably introduced into the United States from Europe towards the close of the eighteenth

century. The eggs are laid under the surface of the leaf, and the young larvæ hatch and grow rapidly, covering themselves with a slimy secretion. There are two generations each year, and the larvæ when abundant skeletonize nearly all the leaves on large trees. The best remedy is to spray with an arsenical wash or with a soap solution, or hellebore may be used either as a dry powder or as a wet spray. Heavy rains will often destroy them, and a forcible water spray will wash them from the leaves.

Among caterpillars which feed upon the pear are the white-marked tussock moth (*Hemerocampa leucostigma*), the red-humped apple-tree caterpillar (*Schizura concinna*), the fall web-worm (*Hyphantria cunea*), the cecropia moth (*Attacus cecropia*), the eye-spotted bud moth (*Tmetocera ocellana*), and others. The plum curculio and the quince curculio (qq.v.) injure pears as well as plums and quinces, although not so extensively. Consult: William Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889); J. B. Smith, *Manual of Economic Entomology* (ib., 1896); Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914).

PEARL (from ML. *perula*, *perulus*, *perla*, pearl, probably variants of *pirula*, dim. of Lat. *pirum*, pear). A morbid product formed from the pearly nacre of the interior of the pearl mussel (*Meleagrina margaritifera*) and other bivalves. It is often due to the irritation caused by the presence of a grain of sand or some other foreign body lodged between the mantle of the animal and the shell; an extra amount of pearly matter is thus secreted and forms roughnesses or projections on the inside of the shell, which, if becoming free and regularly spherical, form one or more pearls. Recent authorities state that pearls are also due to the presence of distomæ. It has been noticed that when the pearl oyster (*Meleagrina*) is large, well formed, and with ample space for individual development, pearls scarcely occur at all, but when the shells are crowded together and become humped and distorted, as well as affording cover for all kinds of marine worms and parasitic creatures, then pearls are sure to be found. (Cooke.) The pearl-oyster fishery is carried on in the Aru Islands, the Sulu Archipelago, the Philippine Islands, Burma, the Persian Gulf, the Red Sea, at Ceylon, along the coasts of Northeastern, Northern, Northwestern, and Western Australia, at New Guinea, and at the Pearl Islands on the Bay of Panama. This species also occurs along the coast of Lower California and in the South Pacific in the Paumotu, Gambier, and Navigators islands, and also at Madagascar. The shell is very large, about 8 to 10 and even 15 inches in diameter, while the valves are very thick and heavy, and in young individuals the outer surface is very rough and corrugated. The largest pearl that is known is said to measure 2 inches long, 4 inches round, and to weigh 1800 grains.

The mother-of-pearl is the internal nacre or nacreous laminae of this oyster. It is utilized in the manufacture of buttons, studs, knife handles, fans, cardcases, brooches, boxes, and all kinds of inlaid work.

Pearls may be formed in almost any bivalve, and some of the most valuable are taken from the shells of fresh-water mussels, but these are usually small and called seed pearls; they also occur in tolerable abundance in the common mussel of the Atlantic coast of North America

(*Mytilus edulis*), very fair specimens at times being found; also in oysters, in *Placuna placenta* of the Pacific, in many species of *Pinna*, and in the giant clam (*Tridacna*). Pearls are sometimes formed in univalve shells; thus, pink pearls have been taken from the giant conch shell (*Strombus gigas*) of the West Indies.

Pearl Fisheries. The average annual value of the pearl fishery of Northern Australia is about \$300,000, the industry having been founded at Thursday Island. It appears that the profits of the fishery are made out of the pearl shell only, because so many pearls are stolen by divers. Western Australia produces \$500,000 worth annually. Pearls and shells to the value of over \$1,000,000 were exported in 1905. Saville Kent distinguishes two species of pearl shells, viz., the large white shell (*Meleagrina margaritifera*) and a smaller black-edged form which he names *Meleagrina nigro-marginata*. Under favorable conditions the shell is supposed to attain in three years the marketable size of 8 or 9 inches in diameter, while in five years a pair of shells may weigh five or six pounds, the extreme weight being 10 pounds. The centre for labor and supplies of the Queensland fishery is Singapore, this port being an excellent market for the shells, while more pearls probably change hands here than in any other place in the world, large quantities being purchased for the Chinese market, where there is an extensive demand for second-class pearls.

The pearl oysters live at depths of from 8 to 20 or more fathoms. For collecting the oysters small vessels of from 12 to 15 tons are most convenient. Two or more such boats are usually accompanied by a larger vessel as a storeship. The best divers are Japanese; Filipinos are also good, and Malays are employed. The diver takes with him a netted bag made of rope. When the depth is from 8 to 15 fathoms, the diver can work at the bottom for two or more hours, but at a greater depth he cannot remain on the bottom more than 15 minutes. The shells usually live in strong currents and in narrow channels between groups of islands, where they lie on a hard bottom.

The pearl fishery of the Mississippi and its tributaries is of much greater importance than is generally known. During recent years 1000 persons have been engaged in this industry on the Mississippi River alone. In 1901 a single firm is stated to have bought from these fishermen \$100,000 worth of pearls, besides the clam or mussel shells from which pearl buttons are made. It is said that the supply of pearls is not being exhausted, but that the demand has increased so rapidly since 1900 as to treble prices. The centre of the industry is Muscatine, Iowa.

The industry of mussel fishing has been greatly extended in the United States in recent years. A partial census of this industry in 1913 showed that mussel fishing was in progress in over 60 streams in the United States and indicated that the value of the product is now from \$2,000,000 to \$3,000,000 per annum. The value of the product of the rivers east of the Mississippi and north of the Ohio was \$546,471, of which \$164,271 was pearls, the remainder shells. The value of the product of the rivers south of the Ohio including those tributary to the Gulf of Mexico was \$443,727, of which \$149,121 was pearls. This does not include the chief field of this industry, the Mississippi River on the Iowa front-

age, of which the census was in progress in 1915. Certain available data on the relative production of the various areas seem to indicate that the Upper Mississippi industry about equals that of the two sections above described, and that the total value of the product of all mussel fisheries is from \$2,000,000 to \$3,000,000 per annum. This estimate is apparently justified by the fact that the value of the shells received by the pearl-button factories of the United States is over \$1,000,000 annually, about two-thirds of this being shells received by factories in Iowa and Illinois adjacent to the great mussel fisheries near Muscatine, Iowa. This, of course, does not include the pearls which form about one-third of the value of the products of the rivers east of the Mississippi. The total value of the pearl-button industry in the United States was, in 1912, \$8,882,000. The factories received, in 1912, \$1,107,742 worth of shells, chiefly from the streams of the United States, also \$2,385,000 worth of "blanks," of which approximately one-half were imported. The value of the investment in these factories was \$3,170,000; material purchased, \$3,504,000; product sold, \$8,882,471.

In the United States the fresh-water pearl industry dates back to 1857, when the "Queen Pearl" was found in New Jersey. It was sold to the Empress Eugénie for \$2500 and is said to be worth now four times that sum. Tennessee, Kentucky, and Wisconsin are the leading States in the pearl industry, and in the 10 years succeeding 1889 it is said that more than \$25,000 worth of pearls were collected in Wisconsin alone. So great has been the destruction of the mussels there that in many places they are nearly if not quite exterminated.

Bibliography. G. F. Kunz, *Fresh-Water Pearls and Pearl Fisheries of the United States* (Washington, 1898); Kunz and Stevenson, *Book of the Pearl* (New York, 1908); W. J. Dakin, *Pearls* (Cambridge, 1913). For extended accounts of the Ceylon pearl fisheries, consult: im Thurn and others in *Spolia Zeylanica* (Colombo, 1903, 1907, 1913); W. A. Herdman, *Pearl Fisheries of Ceylon* (Washington, 1905); also William Saville-Kent, *Great Barrier Reef of Australia: Its Products and Potentialities* (London, 1900); and for recent data on the fresh-water mussels of the United States, *United States Bureau of Fisheries, Documents 781, 793, 804* (Washington, 1914).

PEARL. A beautiful English poem belonging to the fourteenth century and probably to the second half of that century. It is a lament of a father for a lost child, symbolized by a pearl. The poem consists of 101 twelve-line stanzas. The dialect is West Midland. That the poet lived in the west of England near the Welsh borders is all that is known of him. Consult: Modern English versions by C. G. Osgood (Boston, 1906); Sophie Jewett (New York, 1908); W. H. Schofield, "Nature and Fabric of the Pearl," in *Modern Language Association, Publications*, vol. xix (Baltimore, 1904).

PEARLASH (so called on account of the color), or **POTASHES**. Crude potassium carbonate obtained from wood ashes. The commercial product is made in Canada, as follows: wood is burned in pits and the resulting ash spread on a stone floor, sprinkled with water, and worked till it is damp, frequently with the addition of a little lime. The damp ash is then placed in casks containing false bottoms, covered with

straw, and hot water poured over them. The liquid, which is drawn off from a plug hole at the bottom, is evaporated to dryness and finds some use in this condition as a manure owing to the soluble potash that it contains. The crude pearl ash thus obtained may be purified by dissolving in hot water and then cooling, during which the sulphate and chloride, together with the insoluble matter, separate, while the clear supernatant liquid is drawn off and boiled down until it crystallizes. When sufficiently pure this product finds use in the manufacture of flint glass. Ordinary pearlash is used principally, however, in the manufacture of soap.

PEARL HARBOR. An inlet on the south coast of Oahu, Hawaii, 6 miles west of Honolulu (Map: Hawaii, C 2). It consists of several landlocked basins with a narrow entrance inside of which there is a depth of 60 feet. Outside, however, a coral reef prevents the entrance of large vessels. In 1884 the United States obtained the right from the Hawaiian government to establish here a coaling and repair station, and several surveys were made by the United States government. The harbor, however, was not utilized under the independence of the Hawaiian Kingdom and the Republic which succeeded it up to the annexation by the United States in 1898. Since that event the Navy Department has prosecuted the improvement of the harbor and the opening of a channel through the reef on such a scale as to create here a naval base of the first order; the Army Department has kept even pace in the preparation of the shore defenses.

PEARLITE. See METALLOGRAPHY.

PEARLITE (so called on account of the pearly lustre). A glassy or once glassy rock which exhibits a ready separation by cracks into spherical or spheroidal forms. These so-called pearlitic cracks may arise from stresses set up during the cooling of the magma or from differential expansion and contraction about spherulitic masses of feldspar.

PEARL MICA. See MARGARITE.

PEARL MILLET. A cereal grain. See GUINEA CORN.

PEARL OYSTER. A tropical bivalve (*Meleagrina margaritifera*), noted for producing precious pearls and mother-of-pearl. See PEARL.

PEARL RIVER. A river of Mississippi. It rises in Winston County, flows in a generally southerly direction, and empties into the Rigolets, a connecting pass between Lake Borgne and Lake Pontchartrain (Map: Mississippi, F 9). The river is narrow and winding, but with a slight rise is navigable for light-draft vessels for 100 miles, while vessels of 8-foot draft can proceed as far as Gainesville, 15 miles from the mouth. The total length of the stream is about 300 miles. Its drainage basin includes about 7000 square miles.

PEARL WEDDING. See WEDDING ANNIVERSARIES.

PEARL WOOD NYMPH. See WOOD NYMPH.

PEARSE, pērs, ALFRED (?-). An English painter, wood engraver, and costume designer, also an author. He was born at St. Pancras, London, and studied wood engraving from 1872 to 1875. He first achieved fame as an illustrator, being special artist for the *Pictorial World* from 1879 to 1886 and for the *Sphere* on the royal colonial tour in 1901-03.

Among his best-known works are a miniature of Queen Mary, in possession of the King of England; eight pictures for the *Life of King George V*; and "The Opening Ceremony of the City Battalion, Royal Fusiliers." He was specially commissioned to sketch the coronation of King George and Queen Mary in Westminster Abbey, to paint 20 historical pictures for Burke's "Royal Historical Record," and to design costumes for various ceremonies. He is the author of *Fifty Thousand Miles under the Union Jack*, besides numerous stories and articles.

PEARSE, MARK GUY (1842-). An English clergyman and author. He was born at Camborne, studied medicine and then theology, and in 1863 entered the Wesleyan ministry. After holding various charges at Leeds, Brixton Hill, Ipswich, Bedford, Highbury, Westminster, Launceston, and Bristol Pearse was chosen (1889), on the motion of Hugh Price Hughes (q.v.), to take charge of the West London Mission, from which he retired after 14 years of service. His writings, numbering more than 25 volumes, include devotional works and semireligious tales, especially of Cornish life. The best known are: *Daniel Quorm and his Religious Notions* (1874-79), of which several hundred thousand copies were printed in many languages; *Elijah, the Man of God* (1891); *The Gentleness of Jesus* (1898); *The Story of a Roman Soldier* (1899); *West Country Songs* (1902); *Bridgetstown* (1907); *The Prophet's Raven* (1908); *Christ's Cure for Care* (1914).

PEARSON, per'son, CHARLES HENRY (1830-94). An English educator and historian, born at Islington, Sept. 7, 1830. He studied at Rugby, at King's College, London, and at Oriel College, Oxford, receiving a B.A. in 1853, a fellowship at Oriel in 1854, and an M.A. in 1856. In 1855 he was called to King's College as lecturer in English language and literature and after a short time was made professor of modern history. While holding this post he was a regular contributor first to the *Saturday Review* and later to the *Spectator*, until he became editor of the *National Review*. Threatened with blindness, he removed in 1871 to Australia, where until the recovery of his health he pursued the life of a sheep farmer. He subsequently became professor of modern history at the University of Melbourne, but soon resigned this chair to become head master of the Presbyterian Ladies' College. In 1878 he was elected a member of the Legislative Assembly of Victoria and eight years later became Minister of Public Instruction, a post which he held for eight years and in which he thoroughly reformed the educational system in the face of strong sectarian opposition. He returned to London in 1892 and died there May 29, 1894. His principal works are: *Russia, by a Recent Traveler* (1859); *History of England during the Early and Middle Ages* (2 vols., 1867); *English History in the Fourteenth Century* (1876); *Historical Maps of England during the First Thirteen Centuries, with Explanatory Essays, etc.* (1869); *National Life and Character: A Forecast* (1893; new ed., 1914), in which he attempts to show that the white race is doomed to ultimate domination by the black and yellow races; *Report on the State of Public Education in Victoria* (1878); *Reviews and Critical Essays*, edited by Strong (1896). Consult *Charles H. Pearson: Memorial by himself*,

his Wife, and his Friends, edited by William Stebbing (London, 1900).

PEARSON, CYRIL ARTHUR (1866-). An English newspaper proprietor, born at Wookey, Somersetshire. He began his career, after leaving Winchester School, as subeditor of *Tit-Bits*. After four years as manager of the Newnes publications (see *NEWNES, SIR GEORGE*) he started in business for himself, founding *Pearson's Weekly*, *Home Notes*, *Pearson's Magazine*, the *Lady's Magazine*, and other periodicals. An important step in his career was taken in the launching of the *Daily Express* as a halfpenny paper in 1900. Five years later he secured control of the *Standard* and next of the *St. James's Gazette*. His newspaper proprietorship extended until he owned a chain of influential journals in various British cities. In 1903 he became vice president of the Tariff Reform League and vice chairman of the Tariff Commission. Pearson was also prominent in philanthropic work.

PEARSON, JOHN (1613-86). An English prelate of high celebrity. He was born on February 28 at Great Snoring in Norfolk. He was educated at Eton and King's College, Cambridge, where he took the degree of M.A. in 1639, and in the same year took orders and was collated to a prebend in Salisbury Cathedral. In 1640 he was appointed chaplain to Sir John Finch, Lord Keeper of the Great Seal, and on the outbreak of the Civil War became chaplain to Lord Goring, and afterward to Sir Robert Coke, in London. In 1654 he was appointed minister of St. Clement's, Eastcheap, London, and in 1659 published the great work by which he is now remembered and which has been republished many times, *An Exposition of the Creed* (new ed., 2 vols., 1890-91). During the same year Pearson published *The Golden Remains of the Ever Memorable Mr. John Hales of Eton*. At the Restoration honors and emoluments were lavishly showered upon him. Before the close of 1660 he received the rectory of St. Christopher's in London, was created D.D. at Cambridge, installed prebendary of Ely and Archdeacon of Surrey, and made master of Jesus College, Cambridge. In 1661 he obtained the Margaret professorship of divinity and was one of the most prominent commissioners in the Savoy Conference; in 1662 he was made master of Trinity, Cambridge, and in 1673 was consecrated Bishop of Chester. In 1672 he published his *Vindiciæ Epistolæ S. Ignatii*, in answer to Daillé, who had denied the genuineness of the Epistles. In 1684 appeared his *Annales Cyprianici*. He died at Chester, July 16, 1686. Pearson's *Opera Posthuma Chronologica* were published by Dodwell (London, 1688, 3 parts), and his *Orationes, Concioniones et Determinationes Theologicæ* contain much valuable matter. Consult Churton's memoir prefixed to Pearson's *Minor Theological Works* (2 vols., Oxford, 1844) and S. Cheetham, "John Pearson," in A. Barry, *Masters in English Theology* (London, 1877).

PEARSON, JOHN LOUGHBOROUGH (1817-97). An English architect, born in Brussels. He studied under Bonomi in Durham and in London with Salvin and Hardwick, entered practice for himself in 1843, and built churches in Yorkshire (1843-46). A second period, following the construction of Holy Trinity for Archdeacon Bentinck (1850), was largely devoted to restorations of old churches, including ex-

tensive repairs to Lincoln Cathedral and important work at Canterbury, Rochester, Peterborough, Chichester, Bristol, and Exeter. His most widely known work of restoration was that of the north transept of Westminster Abbey. In 1879, having received a gold medal and the cross of the Legion of Honor at Paris in the previous year, he was intrusted with the plans for the new cathedral at Truro, which may be reckoned his greatest opportunity and his best work. For the most part his architectural type was ecclesiastical and Gothic, but he essayed some country houses and office buildings and at times used the Tudor, Jacobean, or Free Renaissance.

PEARSON, KARL (1857-). An English physicist and sociologist. He was educated at King's College, Cambridge, studied at Heidelberg and Berlin, and was called to the bar in 1882. After two years (1882-84) as professor of geometry he was appointed to a chair of applied mathematics and mechanics in University College, London. In 1911 he became Galton professor of eugenics and director of the laboratory for national eugenics at the University of London. His point of view is outlined under **EUGENICS**. Pearson received the Darwin medal from the Royal Society in 1898. Besides editing *Biometrika*, vols. i-viii (1902-11), he wrote: *History of the Theory of Elasticity and Strength of Materials* (1886-93); *The Ethic of Freethought* (1888; revised 1901); *Grammar of Science* (1892; 3d ed., revised, 1911); *The Chances of Death, and Other Studies in Evolution* (1897); *National Life from the Standpoint of Science* (1901); *The Life, Letters, and Labors of Francis Galton* (1914).

PEARSON, WEETMAN DICKINSON. See **COWDRAY OF MIDHURST, W. D. P., BARON.**

PEARSONS, DANIEL KIMBALL (1820-1912). An American physician, real-estate owner, and philanthropist, born at Bradford, Vt. He attended Dartmouth College for one year, taught for a time, and graduated from the medical school at Woodstock, Vt., in 1842. After practicing his profession at Chicopee, Mass., until 1857, he moved West, settling finally at Hinsdale, Ill. Pearsons afterward gave his attention entirely to the development of real estate in and near Chicago and made a great fortune, particularly by rebuilding after the Chicago fire. In 1873 he retired, although he continued director of numerous corporations. His wealth aided more than 40 colleges, the sums given aggregating about \$4,000,000. He required in each instance that a larger amount be raised from other sources before his gift should become available. Most of the institutions selected were located in the West and South.

PEARY, pe'ri, JOSEPHINE DIEBITSCH (Mrs. ROBERT E. PEARY) (?-). An American Arctic traveler, born in Washington, D. C. She was married to Mr. Peary in 1888, and accompanied her husband on his expeditions of 1891-92 and 1893-94 to his winter quarters in Greenland. Here was born their daughter Marie Ahnighito (snow baby), the first white child to be born so far north. Mrs. Peary again accompanied her husband in 1897, and she went north to meet him in 1900 and again in 1902. She is author of *My Arctic Journal* (1894); *The Snow Baby* (1901); *Children of the Arctic* (1903).

PEARY, ROBERT EDWIN (1856-). An American Arctic explorer, discoverer of the

North Pole. He was born at Cresson, Pa., May 6, 1856, graduated from Bowdoin College, Maine, in 1877, became a civil engineer in the United States navy in 1881, and in 1884-85, under government orders, was assistant engineer on the route of the proposed Nicaragua Ship Canal. In 1887-88 he was engineer in chief of the Nicaragua Canal Survey. He was married in 1888 to Josephine Diebitsch. (See **PEARY, JOSEPHINE DIEBITSCH.**) His first expedition to the Arctic was merely a reconnaissance in 1886 of the Greenland inland ice cap east of Disco Bay, in lat. 70° N. From this time until he sailed in 1891 on an expedition to northwest Greenland all his leisure was given to detailed studies and preparations for his participation in Arctic research. During this expedition (June, 1891-September, 1892) he made a brilliant record of achievements, not the least of which was that he reduced to a science the problems of equipment. His journey over the inland ice, from 5000 to 8000 feet above the sea, from McCormick Bay to the northeast angle of Greenland (Independence Bay, lat. 81° 37' N.), a round trip of 1300 miles (including land travel on the northeast coast), was one of the most brilliant feats of polar sledge work ever accomplished. He proved that the northern extension of the great interior ice cap ends below lat. 82° N. He also established the insularity of Greenland and ascertained the existence of detached ice-free land masses north of the mainland and the fact that the east and west coasts rapidly converge north of the seventy-eighth parallel. His ethnological work among the Eskimos known as the Arctic Highlanders (from Cape York to Smith Sound) was the most thorough and noteworthy that had been done in that region. The auxiliary expeditions in which well-known men of science participated gave opportunity for fruitful researches as to glacial and other Arctic phenomena. In 1893-95 Peary made another voyage to the same region, completed his study of the Arctic Highlanders, made a second journey across the ice cap to Independence Bay, and discovered the Eskimos' famous meteorites near the coast of Melville Bay. These were removed to New York in Peary's summer voyages of 1896 and 1897 and in 1909 became the property of the American Museum of Natural History, New York. One of them, weighing 90 tons, is the largest known to exist. Again in 1898 the explorer started north, intending to outline the northern extension of the land masses above Greenland and to reach the North Pole if possible. His work covered four years, during which he made resurveys of a considerable extent of coast line in the neighborhood of Smith Sound, surveyed new coast lines on the west side of Grinnell Land and north of the Greenland mainland, and made a number of notable and very difficult sledge journeys along the northern channels leading to Lincoln Sea. Passing Lockwood's (q.v.) farthest, he traced the northern limit of the land masses north of Greenland to its highest point, 83° 39' N., and then followed the southerly trend of the coast for many miles towards Independence Bay on the east coast.

In the spring of 1902 Peary started over the Arctic Ocean from Cape Hecla, on the north coast of Grant Land, in an attempt to reach the North Pole. At his farthest camp in lat. 84° 17' N. the polar pack became impracticable

and further efforts to advance were given up. In the summer of 1905 he led another expedition, in the ship *Roosevelt* (especially constructed for Arctic exploration), and in the following summer reached $87^{\circ} 6'$, the nearest approach to the North Pole up to that date. It was in July, 1908, that Peary turned to the last great task of his life. For 30 years he had been preparing for it. He had spent a longer period in North Greenland than any other explorer, had lived through more winters, had mapped a larger area. He had suffered severely. The amputation of part of one foot had lamed him for the rest of his life. At 52 he was older than had been other great explorers at the height of their achievement (Franklin 46, Mackenzie 42, Parry 37, McClure 47, Greely 37). Long years of exposure had had their inevitable effect, but he had the supreme advantage of experience, of skill, of courage and capacity for endurance, of enthusiastic and able assistants, and of Eskimo acquaintance and confidence. At Etah were well-equipped, trained natives who owed him everything.

On his final expedition, Peary left New York on the *Roosevelt* July 6, 1908. Robert A. Bartlett (q.v.) was master of the vessel, George A. Wardwell was chief engineer, Dr. J. W. Goodsell was the surgeon, and there were the following assistants: Ross G. Marvin, Donald B. MacMillan, George Borup, and Matthew A. Henson, a negro. Etah was reached August 11. A week later, having taken on 22 Eskimo and 246 dogs, and with renewed supplies of coal and fresh meat, the *Roosevelt* started for Cape Sheridan. Here winter quarters were established September 8, at a point a little north of that selected in 1905. Sledge work over a wide area extended geographical knowledge and in February the work of establishing a chain of depots began. As a base Peary had taken the land mass thought to be nearest the Pole. Seven members of the party on the *Roosevelt* (as named above), 17 Eskimo, 133 dogs, and 19 sledges (some of the improved Peary type) made up the strongest and best-organized expedition that had ever set out to attain the farthest north possible. In an unusual degree the men were familiar with and prepared for the conditions they would meet.

Upon leaving the *Roosevelt* behind, Peary set out for Cape Columbia and from there began the march over the ice of the Arctic Ocean, March 1. Within three days the party reached the "big lead," a strip of water of fluctuating width marking the continental shelf. This did not close up so that it could be crossed until March 11. From here ($84^{\circ} 29' N.$ Lat.) that section of the party which could best be spared returned, commanded by Dr. Goodsell. In five marches $85^{\circ} 23'$ was reached, and thence the second section, led by Borup, returned. The leader started on with 12 men, 10 sledges, and 80 dogs. Marvin, who was drowned on the return, went back from $86^{\circ} 38'$, and Bartlett, with the fourth, from $87^{\circ} 48'$. This was the farthest north attained to that time. The commander now had with him only Henson (the negro assistant), four Eskimo, and the pick of his dogs (40 in number). The 125 miles of the final dash were covered in five days' marches of equal length, $89^{\circ} 57'$ was reached April 6. But on this day, when actually within sight of the Pole, Peary records that he was so exhausted he could go no farther. The next day the few

remaining steps were taken and observations were made—13 single or $6\frac{1}{2}$ double altitudes of the sun at two different stations.

After remaining at the Pole 30 hours, the party started back. The return proved more perilous than the advance. Soundings showed that the party had traveled over ice on an ocean more than 1500 fathoms deep (the wire was exhausted at this point). Moreover, the clear weather disappeared and a north-northeast gale caused serious delay and raised the peril of opening leads. To the east Peary saw masses which he named Crocker Land. Although this land was reported nonexistent by MacMillan when later he made a search for it, Stefansson's (q.v.) observations (reported 1915) showed land beyond and tended to substantiate Peary's claim. The return to Cape Columbia was made in 16 marches and the *Roosevelt* reached Indian Harbor September 5. After his return to the United States, Peary was involved in a bitter controversy with Dr. Frederick A. Cook (q.v.), who claimed to have reached the Pole first by nearly a year. Various honors came to Peary. He received gold medals from various geographical societies, was promoted to rear admiral and received the thanks of Congress (1911), and in 1913 was made Grand Officer of the Legion of Honor of France. From 1901 to 1906 he served as president of the American Geographical Society and in 1904 of the Eighth International Geographical Congress. He is author of *Northward over the Great Ice* (2 vols., 1898); *Snowland Folk* (1904); *Nearest the Pole* (1907); *The North Pole* (1910). Consult Peary's own writings, the periodicals for the years during which he was making his expeditions, and H. L. Bridgman, in *American Geographical Society Journal*, vols. xxxii-xxxiii (New York, 1900-02).

PEARY LAND. A name given to the northernmost coasts of Greenland, which were discovered by Lockwood and Brainard in 1882, under the name of Hazen Coast, and later materially extended by the explorations of Peary in 1892 (Map: Arctic Region, G 5).

PEASANT WAR (OF. *paissant*, Fr. *paysan*, from OF. *païs*, *pays*, Fr. *pays*, country, from Lat. *pagus*, district, province, from *pangere*, to fix, to fasten; connected with *pax*, peace, Gk. *παγνύειν*, *pēgnynai*, to fasten, and perhaps with Goth., OHG. *fahan*, AS. *fon*, Ger. *fangen*, to seize, take). The name given to the insurrection of the peasantry in central and south Germany in the year 1524-25. With the decline of the feudal system the lot of the peasantry throughout Germany had greatly deteriorated. They were still subject to the oppressive exactions of their feudal masters, but the ancient service of protection from master to man had gradually disappeared. The majority of the peasants were the Hürige, a class personally free but subject to onerous dues and services; many were Leibeigene, or serfs, whose dues and services were not limited by law and custom, but were entirely at the will of the lord. The example of Switzerland encouraged the German peasants to hope that the yoke of the nobility might be thrown off, and after 1475 there were risings here and there among the peasants of south Germany. A peasant league rose in the Rhine countries in 1502 and another was organized in Württemberg in 1514, but both were put down. The great insurrection finally broke out in Swabia in June, 1524. An irregular warfare ensued, attended by the most revolting cruelty

on both sides. In spite of the disadvantage under which the ignorant and poorly organized peasants labored, the insurrection spread through Alsace and the Palatinate, Franconia, Bavaria, Tirol, and Carinthia. The rising of the peasants was accompanied by insurrections among the lower classes in many cities. The movement in many parts took on a religious character and was merged with the agitation of the Anabaptists (q.v.), Thomas Münzer (q.v.) becoming one of the principal leaders of the peasantry. The demands of the peasants were set forth in a manifesto, known as the Twelve Articles, issued about Easter, 1525, by the insurgents of Swabia. These embraced the free election of their parish clergy; the appropriation of the tithes of grain, after competent maintenance of the parish clergy, to the support of the poor and to purposes of general utility; the abolition of serfdom and of the exclusive hunting and fishing rights of the nobles; the restoration to the community of forests, fields, and meadows, which the secular and ecclesiastical lords had appropriated to themselves; release from arbitrary augmentation and multiplication of services, duties, and rents; the equal administration of justice; and the abolition of some of the most odious exactions of the clergy. The conduct of the insurgents was not, however, in accordance with the moderation of their demands. Their many separate bands destroyed convents and castles, murdered, pillaged, and were guilty of the greatest excesses, partly in revenge for the cruelties practiced against them. A number of princes and knights were forced to make common cause with them and even to join their ranks, the most noted of these being Götz von Berlichingen (q.v.). Luther (q.v.) denounced the excesses of the peasants and called upon the princes of Germany to stamp out the insurrection. The peasant army in central Germany, under the command of Münzer, was overwhelmed at Frankenhausen, on May 15, 1525, by the Landgrave Philip the Magnanimous of Hesse, at the head of the forces of Hesse, Saxony, and Brunswick. By June disorderly bands in south Germany had been mostly annihilated or dispersed. The peasants, after they had been subjugated, were everywhere treated with terrible cruelty. Multitudes were hanged in the streets and many were put to death with the greatest tortures. It is supposed that more than 100,000 persons lost their lives in the Peasant War. Flourishing and populous districts were desolated. The lot of the defeated insurgents became harder than ever, and it was not till the beginning of the nineteenth century that the burdens of the peasantry were made lighter.

Bax, "The Peasants' War in Germany, 1525-26," in *The Social Side of the Reformation*, part ii (ib., 1899); J. S. Schapiro, *Social Reform and the Reformation* (New York, 1909).

PEAS'LEE, EDMUND RANDOLPH (1814-78). An American physician. He was born in Rockingham Co., N. H., and in 1836 graduated from Dartmouth College, where he remained for two years as tutor. After taking his medical degree at Yale in 1840 he began practice in Hanover, N. H., in 1841. In 1842 he became professor of anatomy and physiology at Dartmouth. He was made professor of physiology and pathology in the New York Medical College in 1851, and in 1858 he assumed the chair of obstetrics and removed to New York City. In 1874 he was made professor of gynecology in Bellevue Hospital Medical College. He published *Human Histology* (1857) and *Ovarian Tumors* (1872).

PEAT (possibly a variant of *beat*, sod, from *beet*, AS. *bētan*, to mend, from *bot*, Goth. *bōta*, OHG. *buoza*, Ger. *Busse*, reparation). The product resulting from the partial decay of vegetable matter—mosses and other marsh plants—which grows and dies in boggy places where water stands. In the northern parts of the world the peat-forming vegetation consists largely of various species of *Sphagnum* (q.v.), or bog moss. In the Southern Hemisphere, on the other hand, no moss seems to enter into the bog vegetation, South American peat being formed, according to Darwin, from many plants, but chiefly a rush, *Astelia pumila*. The vegetation is found in different stages of decomposition at different depths in the peat. In the surface layer the fibre of the plants is often so well preserved that it has been successfully used to some extent as a textile and for paper making. The decomposition increases with the depth until the peat in many cases finally and by insensible degrees passes into a lignite-like mass. The less perfectly decomposed peat is generally brown; that which is more completely decomposed is often nearly black.

Moist peat possesses a decided antiseptic property. This is shown not only in the perfect preservation in bogs of trees, leaves, fruits, etc., but sometimes also of animal bodies. On account of this antiseptic property peat is not well suited for use as a fertilizer in the raw state, but should be allowed to weather before being so used.

In warm regions the decay of vegetable matter is as a rule too rapid to permit the formation of the very extensive peat deposits found in cooler parts of the world and such deposits as occur are more advanced in decomposition. The rate of growth of peat deposits under favorable conditions is variously estimated at from 2 to 4 inches a year. Many thousands of acres of peat occur in north Germany. In Ireland the lowland bog area is estimated at about 1900 square miles and the highland at about 2400 square miles. Russia is said to have 67,000 square miles of peat. Several million acres occur in Norway and Sweden, France, Austria, Denmark, and Holland. Canada is stated to have 37,000 square miles of workable peat bogs (5 to 6 feet deep). It has been estimated that the United States, exclusive of Alaska, is capable of yielding 12,868,500,000 tons of peat. The peat beds of Alaska are very extensive and the peat has been shown to have a high fuel value.

Peat has probably been more systematically and generally utilized in Holland than in any other country, and peat moss for litter and for potting plants forms an important item of ex-

port from that country (10,983 tons in 1913). Other European countries, however, have given considerable attention to the utilization of peat and the reclamation of peat lands. The peat deposits of the United States are comparatively little used commercially, although peat fertilizer filler and drier is now manufactured to the extent of probably 30,000 tons annually and a small amount is being used in the manufacture of cattle food (peat molasses).

Peat was formerly used extensively as a fertilizer, particularly in the form of compost (q.v.), but its use has declined since the general introduction of the more convenient and efficient commercial fertilizers. (See MANURES AND MANURING.) Its principal use as a fertilizer is as a fertilizer filler and drier. Its fertilizing value is not so high as its percentage of nitrogen would indicate, because this nitrogen is in a very unavailable form. Dried peat, and especially peat moss, is an excellent absorbent and is used to a considerable extent as a litter in stables with very satisfactory results. Müntz and Lainé showed that peat can be used with great advantage in filter beds for sewage purification. It is also used to some extent (4800 tons in 1913) in the United States (as already stated) and to a considerable extent abroad in the manufacture of so-called peat molasses, a cattle food prepared by mixing the crude molasses from sugar factories with dried ground peat.

Peat is used to a considerable extent for fuel in certain countries, particularly Ireland, Holland, Germany, and the Scandinavian countries. For this purpose the more perfectly it is decomposed, and therefore the more consolidated it is, the better. For this reason in cutting peat for fuel it is the practice to remove the partially decomposed surface layer and use only the lower and more completely decomposed layers. Since peat is a light and bulky material it cannot be profitably transported great distances. Efforts have therefore been made with varying success to render it more generally useful by compressing it into briquettes of a specific gravity nearly equal to that of coal. The compressing of peat has, however, not yet assumed very great commercial importance. The Canadian government is making a special effort to encourage the use of peat fuel and to this end maintains an experimental peat fuel making plant and testing station. A process for making a dry peat powder fuel has recently been introduced in Sweden, and it is stated that the fuel is being used successfully in railway locomotives and stationary boiler furnaces.

Charcoal prepared from peat is valuable for many purposes. That made from uncompresssed peat is very light and inflammable, but is particularly useful as an antiseptic and deodorizer. That made from compressed peat is superior in density to wood charcoal and is capable of being used as coke. Peat charcoal is highly esteemed for the smelting of iron and for working and tempering the finer kinds of cutlery.

Various attempts have been made to obtain valuable products from the destructive distillation of peat, and various processes have been devised for the manufacture of ammonia, nitrates, and gas from peat, but none of these has yet become of great commercial significance. See COAL; Colored Plate of MUSCI.

PEAT BOG. See SWAMP.

PEA TREE. See PEPPER TREE.

PEAUCELLIER'S (pô'sèl'yáz') **CELL.** See LINKAGES.

PEAU DE CHAGRIN, pô de shá'grän' (Fr., Asses' Skin). A tale by Balzac (1831), in which the hero, Raphaël, is the possessor of a piece of ass's skin having the magic power of fulfilling material wishes, but diminishing in size each time the power is exercised, and associated with a corresponding shortening of the possessor's life.

PE'BA (South American Indian name). A small armadillo (q.v.). In Texas and Mexico the name is given to the nine-banded armadillo (*Tatusia novemcincta*), which is about 30 inches long and is notable as the only edentate that occurs in the United States. In South America the name is sometimes given to armadillos of the genus *Dasypus*.

PEBAN, pâ'ban. A linguistic stock of the Marañón region, South America, on the Río Javary. According to Brinton dialects of this stock are spoken by the Caumaris, Cauwachis, Pacayas, Yeguas, Yaguas, or Yahaus. These Indians have been called by M. Ordinaire "the most perfect physical type of all the Indian races." Consult: Olivier Ordinaire, "Les sauvages du Pérou," in *Revue d'Ethnologie* (Paris, 1887); D. G. Brinton, *The American Race* (New York, 1891); A. F. Chamberlain, in *Journal de la Société des Américanistes de Paris*, N. S., vol. vii (Paris, 1910).

PÉBRINE, pâ'brên'. A disease of silkworms. See SILKWORM.

PEC. See IPEK.

PECAN, pê-kän' or pê-kän' (probably from the North American Indian name), *Carya pecan.* (Formerly called *Hicoria pecan.*) The common name of an American forest tree, 75 to 170 feet high, and its fruit, a nut. (For the botany of the pecan and its forestry value, see HICKORY.) The tree is native to river bottoms from Iowa and Indiana southwest into Texas and Mexico, but is now grown commercially in a number of southeastern States and in California. It has not proved commercially successful north of lat. 40°.

The trees grow on nearly all soils, but for nut production a sandy loam soil with a clay subsoil has proved most satisfactory in the Southern States. The trees should be set about 40 feet apart. Clean orchard cultivation should be practiced. Through cultivation and selection a number of varieties have been originated, which, since they do not come true to seed, are budded or grafted upon seedling stocks. Little pruning except the removal of dead limbs is required after the head has been formed. The trees come into bearing in five or six years,

but paying crops cannot be expected under 10 years, and full crops not under 20. Mature trees sometimes yield as high as 20 bushels of nuts each, but two to three bushels per tree is probably a good average. The nuts have a rounded oblong shape and vary in weight from 25 to 100 to the pound. The varieties called paper shells are considered most desirable, because their shells are very thin and are easily cracked between the fingers. The meats are large and separate easily from the shell. At the present time Texas, Oklahoma, Louisiana, Mississippi, Georgia, and Florida furnish the bulk of the commercial nuts, mostly from native trees. Consult H. H. Hume, *The Pecan and its Culture* (2d ed., Glenn St. Mary, Fla., 1910), and Reed, "The Pecan," in *United States Department of Agriculture, Bulletin No. 251* (Washington, 1912).

PÉCAUT, pā'kô', FÉLIX (1828-98). A French educationalist, born at Salies de Béarn. He was educated for the Church, but after a few years gave up this profession, publishing his religious views as *Le Christ et la conscience* (1859). Thereafter he devoted himself to education, at first in private schools and then as an inspector in the public service, to which he was appointed by Jules Ferry. His educational ideas he set forth in letters to the press and in *Etudes au jour de jour sur l'éducation nationale* (1871-79). His most successful undertaking was the organization of the girls' normal school at Fontenay-aux-Roses, the directorship of which he held for 15 years. Among further writings by Pécaut are: *L'Esprit de Fontenay* (1895), *L'Éducation et la vie nationale* (1897), and a posthumous volume, issued by his sons, *Quinze ans d'éducation*. Consult G. Compayré, *Félix Pécaut et l'éducation de la conscience* (Paris, n. d.).

PEC/CARY (probably from the South American Indian name) A small wild hog of the warmer parts of America, several species of which, of the genus *Dicotyles*, or, as it has recently been divided, the genera *Pecari* and *Tayassu*, represent the swine (Suidæ) in the New World, or, in the view of some, constitute a separate family, *Dicotylidæ*, or, better, *Tayassuidæ*. They differ from typical swine in having a mere tubercle instead of a tail; no external toe on the hind feet; and the tusks short and not curved outward. A gland opening on the

or *Pecari angulatus*), is found in almost all parts of South America and north through Mexico to Texas and Arkansas; the white-lipped peccary (*Dicotyles labiatus*, or *Tayassu pecari*) lives in Guiana, Brazil, Paraguay, and Peru. Both species are gregarious, the white-lipped peccary often assembling in very large herds and sometimes doing great mischief to maize and other crops, which are attacked at night, when the animals do all their feeding. The common peccary chiefly frequents forests, and small companies sometimes take up their abode in the hollow of a great tree. It is about the size of a small hog, grayish, bristly, and maned. A narrow white collar encircles the neck. The white-lipped peccary is considerably larger, of a darker color, with conspicuously white lips. Both species are capable of being tamed, but are of irritable and uncertain temper. In a wild state they defend themselves vigorously against assailants, making good use of their sharp tusks, a whole herd combining for defense. Their most dreaded enemy is the jaguar, or in the north the puma, which seizes one when it can be caught alone, but hurries into a tree to escape the onslaught of a herd. Human hunters have less to fear from them, judging by the Texas examples, than old stories would indicate. Peccaries are omnivorous, and, if hurtful to crops, render service by destroying reptiles. Their voice is somewhat like that of the hog, but more sharp. Their flesh is inferior to domestic pork. Consult Audubon and Bachman, *Quadrupeds of North America* (New York, 1841), and Alston, in *Biologia Centrali-Americana: Mammals* (London, 1879).

PÊCHEURS DE PERLES, pā'shēr' de pērl, Les. An opera by Bizet (q.v.), first produced in Paris, Sept. 30, 1863; in the United States, Jan. 11, 1896 (New York).

PECHILI, or **PECHIHILI**, pā'chē'lē'. An old name for the province of China which is now known as Chili, which means "direct rule" and is so called because it is the one in which is situated the capital (Map: China, L 3). The name Pechili is in frequent use by foreigners outside of China and on maps, but is not used by the Chinese themselves.

Chili is the most northerly of the six maritime provinces of China proper. It now includes within its jurisdiction a portion of inner Mongolia lying north of the Great Wall, where many Chinese have settled. Area, 115,800 square miles, nearly half of which lies beyond the wall.

With the exception of a number of scattered ridges of moderate height in its western and northern parts, the entire province is a plain formed by delta deposits. It is well watered by the Pei-ho (q.v.) with its numerous tributaries and their many feeders and by the Lan-ho, which rises in Mongolia and, like the Pei-ho, flows into the Gulf of Pechili. It is also traversed from southwest to northeast by the Yun-liang-ho, or Grand Canal, which terminates at Tientsin. There are three lakes in the centre of the province and several lagoons elsewhere. The province is rich in minerals, especially in coal, which has long been worked by the natives and is now mined by modern methods at Kaiping (q.v.). Iron is also plentiful, and silver has been found in several places. In the hills are great quarries of granite, marble, white saccharoid, and blue limestone. Except along the shores, where there are alkaline exu-

THE COLLARED PECCARY.

loins near the tail secretes a fetid humor, and must be cut out immediately after killing a peccary, or the flesh will be tainted. The common collared peccary, or tajaçu (*Dicotyles torquatus*,

datations, the soil is fertile and produces good crops of wheat, barley, millet, maize, cotton, tobacco, indigo, etc. The production of rice is not great; it is grown chiefly in the vicinity of the lakes. The climate is extreme, the temperature ranging from 8° below zero F. in winter to 95° F., 100° F., and at times 108° F. in summer. The chief outlet for commerce is the Pei-ho, and Tientsin was the only treaty port until Dec. 15, 1901, when the port of Chinwangtao, near the end of the Great Wall (which had been seized by the foreign admirals operating against the Boxers in 1900 and improved by them), was thrown open to foreign trade. This has a wooden pier 2000 feet long, at which vessels drawing 16 feet can unload. The roads are very poor, but railways have been introduced and under foreign competition are extending rapidly. The province is well supplied with postal and telegraph communications. There are 20 lines of telegraph radiating from Peking to every part of the country.

For administrative purposes Chili is divided into 11 fu or departments, 6 chiehchow or sub-departments, each subdivided into a certain number of prefectures, with the rank of ting, chow, or hien (or hsien). At the head of the government is a governor, with the usual corps of provincial officials, all of whom reside at the capital, Paotingfu (q.v.). Since the opening of Tientsin to foreigners, however, the Governor finds it convenient to spend most of his time there. Of the 11 fu one called Shuntien is detached from the jurisdiction of the provincial government. Its chief city, Shuntienfu, is the seat of the national capital and is best known as Peking. The officer who rules the Department of Shuntienfu resides here. The population of the province is estimated at 20,000,000 by the customs estimate (1910) and at 32,571,000 by the Chinese Michengpu census of the same year. The customs estimate is probably nearer the correct number.

PECHLIN, pěk'lén, KARL FREDRIK (1720-96). A Swedish politician, born in Hölstein and educated in Sweden. He entered the army and was advanced to the rank of major general (1770). In politics he worked against the Hats in 1760, but came over to their side a year later. In 1769 he again joined the opponents of the Hats. Gustaf III's revolution in 1772 put a quietus on his activities, but in 1786, when the opposition became strong, he eagerly joined it. For some time he was imprisoned (1789), and in 1792 he was charged with participating in the murder of Gustaf III. Evidence lacking, he was kept in detention at Varberg's Fort, where he died. See SWEDEN, *History*.

PECHT, pëkt, FRIEDRICH (1814-1903). A German painter, illustrator, and art critic, born at Constance. He was at first occupied for some years as a lithographer in Munich, then went to Paris in 1839 to study painting under Delacroix, and subsequently worked in Munich, Dresden, Leipzig, Frankfurt, and London on portrait and genre pictures. A sojourn in Italy (1851-54) was devoted chiefly to art-historical studies, the results of which he embodied in *Sudfrüchte, Skizzenbuch eines Malers* (1853). Settled in Munich, he became favorably known through a series of scenes from the lives of Goethe and Schiller, but more especially through his illustrations for the *Schiller-Galerie* (1855-59), *Goethe-Galerie* (1861-62), *Lessing-Galerie*

(1866-68), and *Shakespeare-Galerie* (1870-76). For these publications he also supplied the text. He painted frescoes in a hall of the Maximilianeum at Munich and in the council chamber at Constance. His publications include: *Deutsche Künstler des neunzehnten Jahrhunderts* (1877-85); *Geschichte der münchener Kunst im neunzehn Jahrhundert* (1888); *Aus meiner Zeit: Lebenserinnerungen* (1894); and he edited *Die Kunst für Alle* (Munich, 1885 et seq.).

PECK (perhaps from *peck*, *pick*, AS. *pycan*, Icel. *pikka*, to pick, prick). A measure of capacity for dry commodities, such as grain, fruit, etc., used in America, and equivalent to one-fourth part of a bushel (q.v.), or 537,605 cubic inches. It thus contains eight dry quarts. See WEIGHTS AND MEASURES.

PECK, ANNIE SMITH (?-). An American mountain climber, also a classical scholar. She was born in Providence, R. I., graduated from the University of Michigan in 1878, and, after studying in Germany and at the American School of Classical Studies at Athens, taught in preparatory schools and was professor of Latin at Purdue University and Smith College. In 1895 Miss Peck ascended the Matterhorn, in 1897 Popocatepetl and Orizaba in Mexico, and in 1900 Fünffingerspitze (Tirol). Her subsequent and most notable feats in mountaineering were performed in South America. She reached a height of 20,500 feet on Mount Sorata (Bolivia) in 1904, and four years later attained the summit of the north peak of Huascarán (Peru), an altitude of 21,812 feet, 1500 feet higher than Mount McKinley. In 1911, in the first ascent of the two peaks of Mount Coropuna, Peru, her record was 21,000 feet. The government of Peru presented Miss Peck with a gold medal and the United States sent her as official delegate to the International Congress of Alpinism at Paris in 1900. She is author of *A Search for the Apex of America* (1911) and *The South American Tour* (1913).

PECK, CHARLES HORTON (1833-). An American botanist. Born at Sand Lake, N. Y., he graduated from Union College in that State in 1859 and then taught in the Sand Lake Collegiate Institute and the Albany Classical Institute until 1867. After the latter year he had charge of the botanical department of the New York State Museum and after 1883 was State botanist. His publications include: *Boleti of the United States* (1889); *Mushrooms and their Use* (1897); *Plants of North Elba, Esser County, N. Y.* (1899).

PECK, GEORGE (1797-1876). An American Methodist Episcopal clergyman, brother of Jesse T. Peck. He was born at Middlefield, N. Y., joined the Genesee conference of the Methodist Episcopal church in 1816, was appointed presiding elder of the Susquehanna district in 1824, was principal of Cazenovia Seminary from 1835 to 1840, and in the last year was elected editor of the *Methodist Quarterly Review*, which position he filled for eight years. In 1848 he was elected chief editor of the *Christian Advocate and Journal*, in New York, retaining the position for four years. He was delegate to the First Evangelical Alliance in London (1846); pastor at Wilkes-Barre, Scranton, Providence, and Dunmore; and his public labors included a period of 60 years. His published works are: *Universalism Examined* (1826); *Scripture Doctrine of Chris-*

tian Perfection (1841); *Rule of Faith* (1844); *Reply to Bascom on Slavery* (1845); *Christian Exertion* (1845); *Manly Character* (1852); *History of Wyoming* (1858); *Early Methodism within the Bounds of the Old Genesee Conference* (1860); *Our Country* (1865). Consult his autobiography (New York, 1874).

PECK, GEORGE RECORD (1843-). An American lawyer, born in Steuben Co., N. Y. He studied law privately and was admitted to the bar in 1866. Meanwhile, during the Civil War, he had served first in the heavy artillery of the First Wisconsin Regiment and later in the Thirty-first Infantry. He practiced his profession at Independence, Kans., at Topeka (1874-93), and thereafter in Chicago as member of the firm of Peck, Miller, and Starr. While in Topeka he was United States district attorney from 1874 to 1879. As a lawyer he made a wide reputation as solicitor of the Atchison, Topeka, and Santa Fe Railroad and later as general counsel of the Chicago, Milwaukee, and St. Paul. He declined appointment to the United States Senate in 1892, but in general was influential in Republican party affairs. In 1904 he was government delegate to the Universal Congress of Lawyers and Jurists and in 1905-06 was president of the American Bar Association. Peck became known as an orator and as a contributor to jurisprudence.

PECK, HARRY THURSTON (1856-1914). An American classical scholar, author, editor, and critic, born at Stamford, Conn., Nov. 24, 1856. He was educated in private schools and at Columbia College, graduating in 1881 after a brilliant undergraduate career, during which his literary gifts had already attracted wide notice. He was connected with Columbia from 1881 to 1910, as tutor in Latin and for a time in Semitic languages, professor of the Latin language and literature, succeeding Prof. Charles Short, and Anthon professor. In the field of classical studies, where he exhibited rare familiarity with the literature and the faculty of stimulating interpretation, his publications include: *The Semitic Theory of Creation* (1886); *Latin Pronunciation* (1889); *Suetonius* (1889); *Roman Life in Latin Prose and Verse* (1895); *Trimalchio's Dinner* (1899); *A History of Classical Philology* (1911). He was editor in chief of *Harper's Classical Dictionary* and editor of the *Students' Series of Latin Classics* and *Columbia University Studies in Classical Philology*. He was the first editor in chief of the *Bookman* and was continuously a member of its staff from 1895 to 1906; editor in chief of the *International Cyclopaedia* from 1890 to 1901 and coeditor of the first edition of its successor, the *NEW INTERNATIONAL* (1902-04); editor of *Appleton's Atlas of Modern Geography* (1892); coeditor of the *Library of the World's Best Literature* and of *Masterpieces of Literature*; literary editor and editorial writer of the *New York Commercial Advertiser* (1897-1901); and editorially connected with *Munsey's* and with a number of works of reference. Dr. Peck was a frequent and forceful contributor to magazines and newspapers. In addition to his professional writings his works include two successful child's stories, *The Adventures of Mabel* (1889) and *Hilda and the Wishes*; two volumes of essays, *The Personal Equation* (1899) and *What is Good English* (1899); *Greystone and Porphyry* (1899), collected poems; *The Life of Prescott* (1905); *Twenty*

Years of the Republic (1906), a collection of political personalia; *Literature and Studies in Several Literatures* (1909); *The New Baedeker* (1910). His last years were obscured by disease which led to his death at Stamford, March 23, 1914.

PECK, JESSE TRUESDELL (1811-83). An American Methodist Episcopal bishop, brother of George Peck. He was born at Middlefield, Otsego Co., N. Y., studied at Cazenovia Seminary, joined the Oneida conference in 1832, was principal of Gouverneur Wesleyan Seminary in 1837-41 and of the Troy Conference Academy at West Poughkeepsie, N. Y., in 1841-48, president of Dickinson College in 1848-52, pastor of the Foundry Church in Washington, D. C., two years. In 1854 he was appointed secretary and editor of the Methodist Tract Society. He labored eight years (1858-66) in California as pastor and presiding elder. Returning to the East, he was pastor in Peekskill, Albany, and Syracuse, and in 1872 was elected Bishop. He was one of the founders of Syracuse University. He published: *The Central Idea of Christianity* (1855); *The True Woman* (1857); *The History of the Great Republic Considered from a Christian Standpoint* (1868).

PECK, JOHN JAMES (1821-78). An American soldier, born at Manlius, N. Y. He graduated at West Point in 1843 and was assigned to the Second Artillery, with which he served both in the Southern and the Northern campaigns during the war with Mexico, winning by his gallantry the brevets of captain and major. In 1853 he resigned from the service and became treasurer of a projected railroad from New York to Syracuse and cashier of the Burnet Bank in Syracuse. He was a delegate to the Democratic National Convention of 1856. At the outbreak of the Civil War he accepted a commission as brigadier general of volunteers in the Federal service. In 1862 he took part in the Peninsular campaign, and after the battle of Malvern Hill (July 1, 1862) commanded the infantry of the rear guard. On July 4 he was promoted to be major general, and after the withdrawal of the main army from the Peninsula commanded the troops left to hold the strategic position at Suffolk (September, 1862-May, 1863). There he was attacked by Generals Longstreet and D. H. Hill with a superior force, but managed to hold his own until General Hooker's movements before Fredericksburg caused the Confederate government to send its forces north. He was mustered out of the service on Aug. 24, 1865, and in 1867 he organized the New York State Life Insurance Company at Syracuse, of which he was president until his death.

PECK, SAMUEL MINTURN (1854-). An American poet, born in Tuscaloosa, Ala. He was educated at the University of Alabama and in New York. His poems are collected under the titles: *Cap and Bells* (1886); *Rings and Love-Knots* (1893); *Rhymes and Roses* (1895); *Fair Women of To-day* (1896). His *Alabama Sketches* (1902) and *Maybloom and Myrtle* (1910), together with short stories contributed to the magazines, constitute his fiction.

PECK, TRACY (1838-). An American Latin scholar, born at Bristol, Conn. He graduated from Yale in 1861 and continued his studies at the universities of Berlin and Bonn, Germany. From 1871 to 1880 he was professor of Latin at Cornell University; thereafter un-

til his retirement in 1908 he occupied a similar chair in Yale University. In 1898-99 he served as director of the American School of Classical Studies at Rome, where he made his permanent residence after 1909. Of the American Philological Association he was president in 1885-86. His publications include papers read before the American Philological Association and, with Professor Greenough, an edition of *Livy*, books xxi and xxii (1893). With Prof. C. L. Smith he was editor in chief of the *College Series of Latin Authors* (15 vols. up to 1915).

PECK, WILLIAM GUY (1820-92). An American soldier and mathematician, born at Litchfield, Conn. He graduated at West Point in 1844 and was assigned to the corps of topographical engineers. In 1845 he accompanied Frémont's third exploring expedition through the Rocky Mountains, and during the war with Mexico served under General Kearny in the Army of the West. In 1847 he was appointed assistant professor of mathematics at the Military Academy, but in 1855 he resigned from the army and became professor of physics and engineering at the University of Michigan. In 1857 he accepted the position of adjunct professor of mathematics and astronomy at Columbia and in 1861 he was promoted to the chair of mathematics, mechanics, and astronomy. He published a number of excellent elementary textbooks on mathematics, and was joint editor with Prof. Charles Davies of the *Mathematical Dictionary and Cyclopædia of Mathematical Sciences* (1855).

PECKHAM, pēk'hām or -am, RUFUS WILLIAM (1838-1909). An American jurist, brother of Wheeler Hazard Peckham. He was born in Albany, N. Y., and was educated at the Albany Academy and in Philadelphia. Admitted to the bar in 1859, a year later he succeeded his father as law partner of Lyman Tremain. On Tremain's death in 1878 the firm became Peckham and Rosendale. For three years Peckham served as district attorney of Albany County. He was counsel to the Albany and Susquehanna Railroad in its famous suit against the Erie, and in 1881 was successful in the national bank tax cases before the United States Supreme Court. He had already entered politics, serving as delegate to the Democratic national conventions of 1876 and 1880, in which he supported Tilden and Hancock. After a short period as corporation counsel of the city of Albany Peckham entered on his judicial career as associate justice of the State Supreme Court (1883-86). For nine years he sat on the bench of the (New York) Court of Appeals, and in 1895, by appointment of President Cleveland, he became associate justice of the United States Supreme Court. Regarded as one of the ablest jurists in the country, Peckham was also known as one of the most conservative. His opinions in several notable cases concerned with the police power of the States and involving labor and corporation problems were of far-reaching importance; among these were *Ex parte Young*, *Lochner v. New York*, the Addyston Pipe case, and the Trans-Missouri Freight and Joint Traffic Associations cases. Peckham refused to recognize an interpretation of the Sherman Anti-Trust Act (q.v.) based upon the common law. Consult W. H. Taft, *The Anti-Trust Act and the Supreme Court* (New York, 1914).

PECKHAM, WHEELER HAZARD (1833-1905). An American lawyer, brother of Rufus William

Peckham, born in Albany and educated at Union College. He practiced in New York City with his father then in St. Paul until 1862, and in 1864 again in New York, becoming a member of the firm of Miller, Peckham, and Dixon. His growing fame as a constitutional lawyer and his argument on the constitutionality of taxing greenbacks won him the friendship of his opponent in this case, Charles O'Connor, who as Deputy Attorney-General during the exposure of the Tweed ring made Peckham his assistant. In 1884 he was appointed district attorney of New York City, but soon returned to private practice. In January, 1894, President Cleveland nominated him for the Supreme Court, at a time when he was president of the State Bar Association, but the nomination was not confirmed by the Senate, because of the opposition of the New York Senators to Mr. Peckham's antimachine Democracy.

PECK/SNIEFF. A character in Dickens's *Martin Chuzzlewit*, a pompous hypocrite and fraud.

PECK/VILLE. A town in Blakely Borough, Lackawanna Co., Pa., 7 miles northeast of Scranton, on the Delaware and Hudson, the Delaware, Lackawanna, and Western, and the New York, Ontario, and Western railroads. It is in the anthracite region and has extensive coal mines. Its manufactures include iron and steel ware, lumber, powder, and silk. The electric-light plant is owned by the municipality. Pop., 1915 (local est.), 4000; of Blakely, 1910, 5345.

PE/COCK, REGINALD (c.1395-c.1460). A British Roman Catholic bishop, born in Wales. He was educated at Oxford and was ordained a priest in 1421. Ten years afterward he was master of Whittington College, London, and he was appointed rector of St. Michael's, in Riola, Bishop of St. Asaph's (1444) and of Chichester in 1450. He took an aggressive part in the controversy with the Lollards and published an introduction to the Christian faith in dialogue form, entitled *Donet* (c.1440), and *Repressor of Over Much Blaming of the Clergy* (c.1455). In his *Book of Faith* (c.1456; partially printed in 1688) he argued against the infallibility of the Church, and in later works went so far as to deny the authenticity of the Apostles' Creed and to place reason above authority. For these and other heresies and also on account of political opposition to his attitude and teaching, he was called to account before Henry VI and his lords at Westminster (1457) and was given the choice between the stake and recantation. He chose the latter, his 14 books were burned, and he ended his days in seclusion at Thorney Abbey, Cambridgeshire.

PECOS, pā'kōs. A ruined pueblo Indian village near the headwaters of the Pecos River in New Mexico (Map: New Mexico, D 3). It was abandoned in 1838 and its inhabitants are now extinct. Consult Bandelier, *Papers of the Archaeological Institute of America*, American Series, 1, 3, 4, and 5.

PECOS RIVER. The principal tributary of the Rio Grande. It rises at the foot of Baldy Peak, near Santa Fe, in north-central New Mexico, and flows first southeast, then southward along the western escarpment of the Llano Estacado, turning again southeast in Texas and emptying into the Rio Grande 36 miles northwest of Del Rio, Tex., after a course of 800 miles (Map: Texas, A 4). Its drainage area

includes more than 32,000 square miles. In its upper course it flows through a cañon-like valley, and it receives nearly all its tributaries from the west. Near Carlsbad and Hondo, N. Mex., the Reclamation Service has established reservoirs which provide for the irrigation of 20,000 and 10,000 acres respectively, and other extensive projects are planned.

PECQUET, pē'ká', JEAN (1622-74). A French anatomist, born at Dieppe. He studied medicine at Montpellier, where he made the important discovery of the course of the lacteal vessels, including the receptaculum chyli, or reservoir of Pecquet, as it is sometimes called, and the termination of the principal lacteal vessel, the thoracic duct, into the left subclavian vein. He wrote: *Experimenta Nova Anatomica* (Paris, 1651; Eng. trans. as *New Anatomical Experiments*, 1653); *De Circulatione Sanguinis et Chyli Motu*; *De Thoracis Lacteis* (1654).

PÉCS, päch. See FÜNFKIRCHEN.

PECTASE (from Gk. πηκτικός, *pēktikos*, coagulating, from πηγνύναι, *pēgnynai*, to solidify). Pectase, pectinase, and pectosinase are three enzymes that lead to the formation or transformation of pectic substances in plants. Pectosinase hydrolyzes the insoluble materials (pectose or calcium pectate) of the middle lamella of cell walls to soluble pectins. Pectase in the presence of salts of alkali earths, especially calcium salts, coagulates the pectins with the formation of gel. This enzyme is one of the coagulases, of which others are rennin, cyto-coagulase, and amylocoagulase. (See ASSIMILATION.) Pectase is rather generally distributed in organs of higher plants. In fruits the softening with the process of ripening is thought to be largely due to the transformation of pectase of the middle lamella to pectins. The coagulation of pectins in fruit juices leads to the production of jellies. Pectinase extracted from malt hydrolyzes pectins to reducing sugars, d-galactose, and l-arabinose. See DIGESTION IN PLANTS; ENZYME; PECTINS.

PECTEN. See SCALLOP.

PECTINASE. An enzyme which hydrolyzes pectose to reducing sugars—arabinose, etc. Pectinase acts upon either coagulated or unaltered pectic bodies.

PECTINS. Substances of general distribution in ripe fruits and rather common in organs of flowering plants. They probably originate from the pectose of the middle lamella of cell walls and are formed in great abundance in fruits during ripening. When treated with pectase the pectins coagulate, forming a gel. In boiled concentrated fruit juices they also coagulate, probably independently of enzymes, and, along with sugars, organic acids, and other substances, constitute jellies. It has been questioned whether pectins are carbohydrates, but fuller investigation indicates that they are. Hydrolysis with acids or pectinase (q.v.) transforms them to d-galactose and l-arabinose. See DIGESTION IN PLANTS; ENZYME; PECTASE.

PECTOLITE. A silicate of sodium and calcium occurring in silky white aggregates of acicular crystals. It is found with the zeolites in basic eruptive rocks.

PECTORAL CROSS. See COSTUME, ECCLESIASTICAL.

PECTORAL SANDPIPER (Lat. *pectoralis*, relating to the breast, from *pectus*, breast). A well-known migratory sandpiper (*Tringa*, or *Pisobia*, *maculata*) of North America, called

grass snipe, jacksnipe, and meadow snipe by gunners. It owes its book name to an extraordinary ability on the part of the male to puff out its throat (oesophagus) after the manner of a pouter pigeon. (The act is depicted on the Colored Plate of SHORE BIRDS.) It was first noticed by Edward Adams (*Proceedings Zoological Society of London*, 1859), and afterward confirmed, described, and figured by Nelson, Murdoch, and others in their works on the natural history of Alaska (cited under ALASKA), where it has its summer home. This performance is a part of its courtship, not only as an attention to the female, but as a menace to rivals. (Cf. RUFF.) During its migratory visits to the United States it is a favorite with sportsmen, because of its gamelike manner of lying well in the grass before a dog and its crooked, snipelike flight. Moreover, its flesh is exceedingly palatable.

PECTORILOQUY (from Lat. *pectus*, breast + *loqui*, to speak). The term applied to a distinct transmission of articulate voice sounds when the ear or stethoscope of the listener is placed upon the chest wall. This phenomenon was discovered and named by Laënnec (q.v.) in 1818. In the normal chest the voice sound is transmitted through the lung substance of the patient to the ear of the listener only as a distant, muffled sound, known as *vocal resonance*. Over the bronchi this vocal resonance is increased, the voice sounds become nearer and louder. When there is an approach to articulate speech, this is called *bronchophony* and occurs also over portions of lung tissue which have become solidified by disease. In pectoriloquy, however, the voice is not only louder and plainer, but words and even syllables are perceived with startling distinctness. The pathological conditions under which this occurs are either a consolidation of the lung substance connecting a large bronchus with the chest wall, which consolidation acts as an unusually perfect conductor of the vocal vibrations; the presence of a cavity in the lung having free communication with a bronchus, in which case the sound is conveyed by air; a pneumothorax having open connection with a bronchus; or, more rarely, compression of the lung by an extensive pleuritic effusion. (See PLEURISY.) As a rule, pectoriloquy is interpreted to mean the existence of a cavity in the lung with a thin layer of solidified tissue between it and the chest wall.

Whispering pectoriloquy is produced, under the same conditions mentioned above, when the patient whispers instead of talking. See AUSCULTATION; RESPIRATORY SOUNDS.

PECTOSINASE. See PECTASE.

PEDAGOGY, pēd'ā-gō'jī, or **PEDAGOGICS**, pēd'ā-gōj'iks (from Gk. παιδαγωγία, *paidagōgia*, training of children, from παιδαγωγός, *paidagōgos*, trainer of children, from *pais*, *pais*, child + *agōgos*, *agōgos*, leader, from *agein*, *agein*, to lead). The science of education; a body of facts and principles bearing on the aims and methods of effectively equipping the young for life—aiding them in attaining their spiritual majority and fitting them for their vocation. Numerous and complex, the problems of education can be worked out only by the help of the sciences of psychology, physiology, ethics, sociology, and anthropology, and, in the light of the spirit of the time, the ideals of the nation, and existing local conditions. Any solu-

tion of them, indeed, is impossible, except through the coöperation of the various institutions that make up society: the home, the school, the church, the diverse vocations, and the state in its several functions. The distinguishing characteristic of the study of pedagogy from 1905 to 1915 was the steady application to it of experimental methods which tended to place the subject on a definitely scientific basis. This aspect in the development of pedagogy is treated below under the caption of *Experimental Pedagogy*.

While there are certain fixed factors in education, and certain principles of universal application, the greater part of the educational field is characterized by adjustment and change.

The expansion of modern knowledge and the complexity of modern life are reflected in the modern crowded curriculum and in the problems to which it gives rise. In a "three-R" elementary curriculum, or in a college course consisting largely of Greek, Latin, and mathematics, the choice of studies was only an academic question; with a multitude of subjects to choose from, the question of educational values becomes vital. This question has been asked and answered in various ways. With Herbert Spencer it took the form: What knowledge is of most worth? Spencer's answer was, Science, by which he meant the scientific habit of mind in mastering those subjects which bear on man's efficiency in society, including primarily the natural sciences and history, with literature and art subsidiary to these. Nicholas Murray Butler, in an essay bearing the same title, assigns the highest place to those subjects that afford in the highest degree nurture and exercise to man's spiritual nature, and in this judgment modern educators generally agree with him. Attacking this same problem at closer quarters, Commissioner William T. Harris has asked the question, What groups of subjects are essential to a complete education? and gives this answer: There are six coördinate groups of studies: (1) mathematics and physics, which give us the command of nature quantitatively; (2) biological science, which gives us the key to the organic phase of nature; (3) literature and art, which reveal human nature in its intrinsic form and show man in his relation to social institutions; (4) grammar and language, and studies allied with them, such as logic and psychology, which enable the mind to know itself analytically; (5) history, or the study of the development of the state and its relations to the individual; (6) religion, which looks at human experience and knowledge in their relation to God. An education which should not provide at least the elements of each group would be incomplete.

The question still remains, Upon what principles shall studies be chosen within these groups? A favorite way of approaching this question has been to classify all subjects (1) as giving discipline to the faculties of the mind, (2) as giving practical training for life, (3) as giving culture. Thus, bookkeeping and spelling are valued chiefly for their practical value; algebra and grammar for their disciplinary value; literature and art for their power to give that sympathy, appreciation, and insight into the meaning of life which we call culture. But it is clear that no subject is without some value in each of these departments. And, further, it appears that much depends on the

method of teaching, the purpose in view, and individual attributes; the same study may serve now as a bread-and-butter subject, now as a culture subject, according to circumstances. The same study may train memory or reason, according to the method employed; or the same study may be good for one pupil and not so good for another. Moreover, with the fall of the faculty theory in psychology, the dogma of formal discipline has been discredited. It is held that there is no such thing as training "the memory," and that to transfer skill acquired in one department to another department is not in any strict sense possible. It follows that in any given case considerations of environment, aptitude, aim in life, and method must have greater weight in determining the choice of studies than values assigned to studies in the abstract. These considerations furnish justification from one point of view for the expansion of the modern curriculum and the concomitant development of the elective system.

At what point shall studies be introduced? This question is to be answered partly in the light of the capacity of the child and partly in the light of the culture-epoch theory, which assumes that the child in his development passes through a series of stages corresponding closely to the epochs through which the race has passed in its progress from primitive to modern culture. Gen. Francis A. Walker, after investigating the study of arithmetic in the elementary school, protested against "prying up" the powers of the child by giving him tasks for which he was not yet ready and which he could in due time perform naturally and easily. On similar grounds it has been proposed to decrease the amount of reading and writing called for in the first three years of school; but advocates of this plan seem not to give sufficient weight to the fact that children in these very years show a decided tendency to perform these activities and a marked ability to master them. It is clear that to postpone the study of mythology and of mediæval history until the child has passed the culture epoch to which they appeal involves waste. The application of this latter principle, however, is made difficult by the fact that the youngest child is a member of the modern world as well as of the primitive world—that he can and must learn about the arrangements for heating and lighting his own house as well as about the old-fashioned backlogs and tallow candles.

Children in the elementary school sometimes carry as many as 15 so-called "subjects" at one time: how shall they be kept from being overwhelmed by the multiplicity of subjects and interests? Certain well-established principles throw light on the solution of this problem. First, the doctrine of apperception, which asserts that the mind acquires knowledge by means of knowledge already possessed—that what we can learn is conditioned absolutely by what we have to learn with. Secondly, the principle of self-activity, which affirms that the child is not primarily a knowing being, but an active being, whose instincts and impulses start him on the way to knowledge, and whose practical needs teach him to think. Empirical observation attests the truth of these principles; it has been conclusively shown, e.g., that under the old régime children learned the little they had to learn with greater difficulty and strain than they accomplish their greatly increased

tasks, if only the work be properly organized and conducted.

In order to understand the various attempts at *correlation* it is necessary to consider the evolution of the idea. The revolt against the isolation of studies was the outgrowth of Herbartian doctrines. According to Herbart, "erziehender Unterricht"—instruction that educates, or education through instruction—expresses the aim and the chief means of formal school work. Now, education means moral character building, and character is produced by the training and culture of volition—the will being reached only through the emotions, these in turn depending on ideas. But not from ideas in any form and relation do emotional warmth ("interest") and volitional energy spring, but only from those ideas that are knit into a living whole. Hence the fundamental significance in the Herbartian pedagogy of the phrase "circle of thought," by which it is meant that instruction should be both many-sided and closely connected; and hence the capital rôle played in the same system by *interest*—interest being that condition of mind of which the cause is knowledge made real and vital through being related and of which the effect is volition. The early schemes of correlation were produced in Germany and were characteristically formal, treating correlation as chiefly a question of curriculum, and so perhaps better described as schemes for the *coördination* of studies. Usually, however, German plans of coördination took the form of *concentration*, whereby certain studies were made dominant and others were treated as subsidiary to them. There was no agreement as to what studies should be the core—some choosing literature and history, others natural sciences. In America, under the impulse of Herbartian ideas, much fruitful experimenting has been done, at first after the German manner (taking *Robinson Crusoe*, e.g., as the central subject of a year's work and "relating" arithmetic, geography, reading, drawing, manual training, and other studies to this core) and later in ways independently American. For the most part this latter work may be described as *informal correlation*. For example, a part of the work of a year or a part of the year in a certain grade may cluster around the reading of *Hiawatha* and the making and decorating of various objects illustrative of the story, no attempt, however, being made to confine the work in arithmetic, geography, and nature study within the limits of *Hiawatha's* life. Even where correlation is not recognized in the curriculum there is an increased tendency to recognize the manifold interrelations which exist between all subjects and parts of subjects. In support of such partial schemes it is claimed (1) that variety and difference are as essential to wholesale mental development as are identity and relatedness; (2) that the child studies with intense interest and with assimilation so apparently isolated a study as arithmetic; (3) that a correlating teacher can make an apprehensive child even without a correlated curriculum. But there can be no doubt that waste is often avoided by studying at the same time subjects related both to each other and to the theoretical and practical interests of the child.

The most important single contribution to this subject made by American educators is the monograph *Interest as Related to Will*, by Prof. John Dewey, in which interest is represented as

arising when the child does that which makes for self-expression (self-realization). This view not only places interest in its proper subordinate place, but also makes it clear that a curriculum is not to be worked out in the closet, and that character building does not necessarily result when the child is occupied with apparently interrelated studies. In the practical working out of this principle the child, with his manifold impulses to act, his interests, his social relationships, his spiritual environment and heritage, becomes the core of correlation, and those creative social activities that have to do with providing food, clothing, shelter, and æsthetic expression become the gateway both to knowledge and to character. The influence of this insight into the dynamic nature of education (whereby "educative activity" is substituted for "educative instruction") has been and is destined to be profound and far-reaching.

Ever since the rise of democratic institutions there has been developing a new conception of the worth of the individual, and during the past 50 years this conception of the individual has been modified and reinforced by a new conception of society. It is now coming to be vividly realized that the ideal of individual development is realized in the highest social efficiency, and that the ideal social or institutional development demands individuals that have attained perfect self-realization. This insight has been reflected in educational aims and methods. In the old education, based on a certain lack of faith in the individual and on contempt for the body and this present world, the characteristic notes were authority, intolerance, and disregard of hygienic laws; the mainstay in teaching was naturally memorizing. The new education is based on respect and even reverence for humanity—on belief in the worth of the present moment and on the doctrine of evolution. Its dominant features are, therefore, appeal to individual observation, experience, judgment, reason—enrichment of school programmes; and enlightened consciousness of the differences in individuals and a consequent tolerance and adaptation. Under the impulse of these conceptions school hygiene is recognized as an important adjunct to pedagogics; psychology, instead of dealing only with traits supposed to be common to all, is investigating those peculiar to types and even to individuals; child study makes careful studies of actual children at various stages of development in order to determine effective ways of dealing with each type at each stage. As for educating the child to be a social being, the new education proceeds by regarding and treating him as a social being from the start. The most advanced schools of all grades are those which recognize most fully the possibilities of social training latent in the class, the school, the playground. Constructive work, especially the form known as group work (where all the members of the class are engaged on a common project, each contributing his share), is a fine illustration of how a subject can contribute to both individual and social development. Mention has already been made of the recognition of the need of adjusting the child to his social environment through the curriculum. The bearing of these ideas on *moral education* is obvious. Morality is to be attained in the individual as such only through his own free and responsible choosing to obey law; it is best to be attained in the individual considered

as a social unit by living morally in the society of which he is a member—the family, the school, the neighborhood.

The main objection urged against the new education is that it fails to provide for training that power to "endure hardness as a good soldier" which is the bone and sinew of character; that in suiting school work to the grain of a child's disposition it fails to prepare for those demands of life which go against the grain. It is a sufficient answer to this objection to say: (1) that bone and sinew are none the less firm, and they are the more useful, when developed by growth rather than inserted ready-made; and (2) there is no virtue or strength either in school or in life to be gained by overcoming difficulties merely by a dead pull, the secret of power in performing difficult tasks is the ability to raise any task above the level of drudgery into relation with life as a whole. By giving this power the new education greatly multiplies the ability to overcome obstacles.

Educational Methods. The word "method" is used in two senses: (1) to designate those special rules which are applicable to the teaching of a particular subject, and (2) to designate general modes of procedure applicable to all subjects. Examples of the first are the various methods of teaching reading, as the phonetic method, the sentence method, the word method, etc. Each of these methods can be defended on psychological grounds, yet each is incomplete. The most effective method is that which combines the good points of all methods into one. The final test of a method is not, "Can arguments be made in its favor?" but "Will it work?"

Under the head of "general method" belongs the doctrine of the *formal steps of instruction*. This doctrine is based on the assumption that the mind must follow a certain order of processes in grasping any subject presented to it: there must be *preparation* of the ideas already in the mind, *presentation* of the new facts, *comparison*, *abstraction*, *generalization*, whereby the meaning of the facts is arrived at and stated in terms; and, finally, *application*, whereby the knowledge thus gained is translated into life. The essential value of this doctrine lies not so much in its assumption of an unchanging time order of processes as in its emphasis of the fact that there are certain processes which are essential to a complete act of instruction.

Using "general method" in the sense of a law of teaching applicable to any subject, the following maxims may serve as examples: 1 In all teaching, whether in instruction or in training, let spirit be uppermost and mechanism subordinate to it. This is the first and great commandment, upon it are based a multitude of specific directions; such as, thought first, form second; interest first, then criticism; praise first, if possible, and let blame be simply the subtracting from a fund of praise; let the teacher's first aim be to lead the pupil to love a subject, and afterward he may do what he will; seize the moment of excited curiosity that it may not run to waste—an impulse of the human spirit is a power which the teacher cannot produce at will, but which unfortunately he can cramp and suppress; on the other hand, the teacher should make mechanism his ally, not his enemy. "Drive thy habits, let them not drive thee." 2. A second general principle may be stated thus: we learn most effectively by our

own activity under the spur of a practical interest. We learn least effectively when we are least active and least interested. A teacher who applies this principle will multiply opportunities whereby his pupils may learn by experience, by discovery, by executing; by object lessons, laboratory and shop work and the relations of school life, whereby they may apply what they have heard or read or gained in any secondhand way, thus supplying, though in the reverse order, the element reality. 3. A third general principle of teaching may be described as learning by thinking. The teacher who follows this leads his pupils to avoid being swamped by details, because, grasping together many particulars into a convenient bundle duly tagged, he will form in them the habit of foresight and forethought, and he will develop in them the power to search out meanings and to find the essential point of a problem, a situation, or an argument.

In deciding the order to be followed in teaching the topics in a subject, two conflicting systems have held sway. The first arranges the topics of the subjects in logical order, ignoring the fact that what is first in experience is last in thought, that the psychological order is usually the reverse of logical order. The second arranges the topics with reference to the child's supposed needs, either (1) teaching related processes concurrently (as in the Grube method in arithmetic) and carrying a number of topics abreast, returning to each at more or less regular intervals with increased power, as in the *spiral method*, or (2) determining the order of topics rather by the need of the child than by the strict development of the subject; e.g., introducing the subject of osmosis at the point when the children are eager to understand how the root of a plant receives nourishment from the earth.

By the *inductive method* of teaching a pupil is led from facts to generalizations; e.g., in natural science where individual forms are first observed, then classified according to essential characteristics, and in the study of syntax, where the rule is formulated after several cases of the construction are observed and compared.

By the *deductive method* the teacher or the author first states a principle and then proceeds to elucidate and exemplify it, as when in grammar the definition of noun is given and then examples of nouns. Each of these methods has its own field, every subject having its deductive and its inductive stage, and every study of any subject being partly deductive and partly inductive. In the *Socratic method* the teacher asks questions designed to lead the pupil to think about what he already knows, to see his mistakes, revise his judgments, and discover the truth. This method is especially applicable in subjects involving moral or æsthetic judgments, where the pupil has experiences and knowledge more or less unorganized. Akin to this is the *method of discovery*, which leads the pupil to experiment, observe, infer, and formulate conclusions. In all the above methods the principle of self-activity and participation is called in. Often combined with these is the *method of discussion*, in which the teacher proposes, or has members of the class propose, theses to be defended. The advantages and dangers of this method are extreme. Great skill and address, together with the power of summarizing the discussion, are required in the leader. All these

methods aim to make the pupils ready, resourceful, self-reliant. They need to be supplemented by some form of the *lecture method* or by the *textbook method*, which are strong on the side of exactness and breadth. The *recitation* (which is the name applied in the United States to class exercises in general) varies in efficiency according to the method pursued. The minimum of advantage results if the time be spent in saying lessons learned memoriter from a book or in reciting facts more or less known to all the class. A class exercise is at its best when the class is engaged upon some problem towards the solution of which each one, including the teacher, from his peculiar point of view, contributes his proper share. It has been proposed that instead of recitations in which the quick and the slow proceed at the same rate, each pupil should be allowed to go at his own pace under the guidance of the teacher. This plan (known as the *Pueblo plan*), though it contains an element of wisdom, is of only limited application. Its vital defect lies in its failure to recognize sufficiently the social value of the recitation.

Experimental Pedagogy. During the decade 1905-15, largely through the rapid development of experimental methods in psychology in all its branches, the study of pedagogy has become experimental. The way was paved during the last two decades of the last century by a closer study of the child; but while this method showed an advance, it depended too largely on the observation of individuals and in general dealt with the child before school age. Experimental pedagogy aims to bring to the study of education the exact methods and equipment of a science; it is based not merely on the observation of individuals, but on the application of statistical measurement of facts bearing on the school life of children under actual classroom conditions. Hence pedagogy, except in so far as the general theory of the aim of education is concerned, is becoming a quantitative and inductive science, where hitherto it was wholly qualitative and deductive; in place of generalizations of the theorists the teacher is now made familiar with the results of experiments dealing with different phases of school work reached by scientific methods similar to those of the laboratory. While the methods of experimental pedagogy are essentially those of the experimental psychologists, the point of view is different in that it deals with the school child not merely with reference to his mental makeup, but also with his physical, moral, and social sides.

Although the progress and results of the study have been remarkable in the short time of its existence, it must still be regarded as in its early stages. Before school work can be definitely affected much remains to be done in standardizing results and in making these available for the classroom teacher. One of the strongest features in the study of experimental pedagogy is that studies are made not only under widely varying conditions in each country, but that there is much international co-operation.

It is impossible within this brief compass to do more than indicate the nature of the subjects with which experimental pedagogy treats. Starting with the child as a human being, it seeks to trace the relationship between his native ability and school progress. Valuable con-

tributions have been made on this phase by the tests of Binet and Simon for measuring native ability. Allied to this topic is the study of the influence of individual differences and a recognition of their importance in school work. In a few other subjects, such as the questions of fatigue, memory, attention, transfer of training, etc., it is difficult to distinguish between experimental pedagogy and experimental psychology. More closely and definitely related to school work have been such school studies as handwriting, spelling, arithmetic, drawing, and English composition. The aim here has been not so much to investigate the processes of learning these subjects as to discover what standards may be expected from children in different stages of school life. To this end scales of measurement have been developed already in the subjects mentioned with the aid of these scales, some of which have been standardized for the whole country, e.g., in handwriting, a teacher in any school can not only measure the progress of her pupils, but can judge whether their standard of attainments reaches the general standard to be expected, according to the "measuring stick" from children of that age. Scales in handwriting have been developed by Professor Thorndike of Columbia University and Dr. Ayres of the Russell Sage Foundation, in arithmetic by Mr. Curtis, in drawing by Professor Thorndike, and in English Composition by Professor Hillegas of Columbia University and Dr. Ballou of Boston. The great value of these studies is that they set up easily recognizable standards; their danger is that it may sometimes be forgotten that in general they indicate the minimum attainment to be expected at any age. At the same time, since they are applicable to all stages of school work, they offer better bases for the classification of pupils than any that have existed hitherto. From these few instances, the first fruits of the study of experimental pedagogy, it will be recognized that it is now being placed on a scientific basis, and that scientific authority will take the place in future of tradition and fads.

Thorndike, *Educational Psychology* (New York, 1914).

PED'AL (Lat. *pedalis*, relating to the foot, from *pes*, foot). Any part of a musical instrument acted on by the feet. The pianoforte, the harp, and the organ are furnished with pedals, which, however, serve an entirely different purpose in each instrument. See HARP; ORGAN; PIANO.

PEDAL POINT. See ORGAN POINT.

PED'DLER. A person who travels from

place to place selling at retail goods, wares, and merchandise, which he carries about with him. Peddlers are to be distinguished from ordinary traveling salesmen, who sell goods by sample and have a recognized headquarters from which the goods are shipped. Because of the irresponsible character of most peddlers and the difficulty of tracing fraud or other crime to them, statutes have been enacted in almost all of the United States requiring them to take out licenses and to conform to certain other regulations, such as wearing a badge or shield, bearing their license number, where it can be easily seen. See LICENSE.

PEDEE RIVER. The name of the Yadkin River after it enters South Carolina (Map: South Carolina, E 2). The Yadkin has its sources in the Blue Ridge, in Wilkes County, northwest North Carolina, and flows through the State in a south-southeast direction. In South Carolina it receives as tributaries Lynchies River, from the west, and the Little Pedee River and part of the Wacamaw River, from the north. It empties into the Winyaw Bay at Georgetown. It is navigable for 150 miles.

PEDERSEN, pā'dēr-sēn, CHRISTIERN (1480-1554). A Danish theologian and writer, known as the Father of Danish Literature. He was canon of the cathedral of Lund, spent the years 1510-15 in Paris, and afterward became secretary to Christian II, whom he followed into exile (1525). Pedersen joined the Reformation, translated the New Testament in Holland (1529) and the Psalms (1531), and published many Lutheran tracts. Returning to Malmö (1532), he established a printing press. His greatest work was a translation of the Bible (1543), called the Bible of 1550, or Christian II's Bible. It was founded upon Luther's version and is an important landmark in Danish literature.

PED'ESTAL (It *pedestallo*, base of a pillar, from *piede*, from Lat *pes*, foot + *stallo*, from OHG *stal*, Ger *Stall*, stall). A base for columns, statues, vases, etc. The pedestal is much used in classic (especially Roman) architecture. Like the column it has a base, a body or central block, called the dado or die, and a cap or cornice, sometimes called the surbase. Its function in columnar architecture is to permit the use of a smaller column and entablature than would otherwise be possible for a story of a given height. In connection with sculpture the pedestal is a feature of the utmost importance, on which designers in the Renaissance period bestowed careful study. The superb pedestal of the Colleoni statue at Venice is an example of this. The pedestal of the Statue of Liberty in New York harbor is a vast granite structure nearly 150 feet high, the cost of which, borne by popular contributions from all parts of the country, was over \$300,000.

PEDIANUS, QUINTUS ASCONIUS. See ASCONIUS PEDIANUS, QUINTUS.

PE'DIATRICS. See CHILDREN, DISEASES OF.

PEDIC'ULA'RIS (Lat., lousy). A genus of more than 100 species of the family Scrophulariaceæ, some of which have rather large and finely colored flowers. Several species have been called lousewort, the English equivalent of *Pedicularis*, from their supposed influence in producing the louse disease in sheep. Their acidity seems to make them injurious as sheep food. Many species are found in continental Europe and northern Asia and some in North America.

A few species are cultivated chiefly for their finely cut beautiful foliage. *Pedicularis canadensis*, wood betony, is the most common species in the United States. See Colored Plate of MOUNTAIN PLANTS.

PEDIC'ULA'TI (Neo-Lat. nom. pl., from Lat. *pediculus*, little foot, dim. of *pes*, foot). An order of marine fishes having the carpal bones elongated into a kind of arm which supports the broad pectoral fin, and the anterior dorsal fin reduced to a few tentacle-like, mostly isolated spines: the anglers (see ANGLER), frogfishes, etc. See Plate of ANGLERS AND BATFISH.

PEDIGREE (of uncertain etymology, perhaps from OF. *ped de grue*, crane's foot, in allusion to the resemblance of the lines of a pedigree to a bird's foot). Family relationship traced back through a number of degrees or generations, sometimes including the record of births, marriages, and deaths. The term is most frequently employed in the law in connection with a rule of evidence which forms one of the exceptions to the so-called hearsay rule of evidence, and may be generally stated to be that statements as to the pedigree of the party in question made by a blood relative of that party, as a brother, since deceased, may be repeated by a witness who heard them made. See AFFINITY, CONSANGUINITY, EVIDENCE, KIN, NEXT OF KIN.

PEDIMENT (Lat. *pedamentum*, prop for a vine, from *pedare*, to furnish with feet, from *pes*, foot). The low-pitched triangular gable at the end of the roof of a building of classic type. It is inclosed by the horizontal and the raking cornices, the latter following the slopes of the roof. In Greek temples the pediment was frequently enriched with sculpture, for which it forms a fine setting. The finest examples are the pedimental sculptures of the temples of Ægina, Olympia, and the Parthenon at Athens. The doors and windows of buildings of the Renaissance are often surmounted by pediments, either straight-sided or curved, and in the late or Barocco (qv) period these were often interrupted or cut away at the summit, to admit a bust, vase, or other ornament—the so-called broken pediment. Broken and scrolled pediments, often treated with great elegance, occur frequently in American Colonial architecture.

PEDOMETER (from Lat. *pes*, foot + Gk. μέτρον, *metron*, measure). An instrument resembling a watch and used for measuring distances traveled by walking. Such an instrument usually records on a dial plate the number of steps taken by the person carrying it or the distance based on the average length of step of the individual to which the mechanism can be adjusted.

PEDRARIAS DÁVILA, pā'drā-rē'as dā'vê-là (c.1440-1530). A Spanish administrator in America, born in Segovia, Spain. Pedro Arias Dávila was his proper name, but historians have contracted it. He distinguished himself in the conquest of Granada, and he served in the New World as Governor of the Spanish colonies on the Isthmus of Panama in 1514. He found a rival there in Balboa, whom he finally executed (1517). This deed put Pedrarias out of favor with the Spanish court, but the emissaries sent to dislodge him failed in their mission, and he continued Governor, founded Panama (1519), and -extended his sovereignty by settling colonies to the north and south. But he was jealous of any one else attempting the same, hindered Pizarro as much as he could, and had

Córdoba beheaded for trying to league himself with Hernando Cortés at Honduras. For these and other tyrannical acts Pedrarias was called upon to exchange the governorship of Panama for that of Nicaragua, where he died.

PEDREGAL Y CAÑEDO, pá'drá-gal' é ká-nyá'dó, MANUEL (1832-96). A Spanish jurist-consult and publicist, born at Grado (Oviedo). He studied law and took a prominent part in politics as an ardent Republican. After the abdication of Amadeus in 1873 and during the period of the Republic Pedregal was twice Minister of Justice and once Minister of Finance. The following year he returned to private life and devoted himself to study and to the foundation (1876) of the *Institución Libre de Enseñanza*, of which he was made rector in 1883. He reentered politics in 1882 as Deputy from Oviedo, and with Azcárate, Salmerón, Labra, and others, organized the Republican party called Centralista, which has stood for the best element in radical politics. His works include: *El poder y la libertad en el mundo antiguo* (1878), *Estudios sobre el engrandecimiento y la decadencia de España* (1878), *Nociones de hacienda pública* (1881), *Sociedades cooperativas* (1888), *Elección presidencial de los Estados-Unidos* (1892).

PEDRELL, pá-dré'l'y', FELIPE (1841-) A Spanish composer and writer on music. He was born at Tortosa and studied music entirely by himself. His works include the operas *El último Abencerraje* (1874), for which he wrote music and book, *Quasimodo* (1875), *El Tasso en Ferrara*, *Cleopatra*, *Mazeppa* (all in 1881), *La celestina* (1904), *La matnada* (1905). His most important work, and the greatest by a modern Spanish composer, is his trilogy *Los Puercos*, the first complete performance of which took place at Barcelona in 1902. Besides these he wrote also a mass, several larger choral works with orchestra, songs, and piano pieces. In all these works there are originality and a successful effort to build up a national musical style. Of even more importance is Pedrell's work as a critic and historian of music. The two great works, *Hispania Schola Musica Sacra* (1894 et seq.) and *Teatro lírico español anterior al siglo XIX* (1897 et seq.), are original and able. His lexicographical labors include *Diccionario técnico de la música* (1894) and a biographical dictionary of Spanish and Portuguese musicians (1897 et seq.).

PEDRO I, Port pron pá'dró (DOM ANTONIO PEDRO DE ALCANTARA BOURBON) (1798-1834) Emperor of Brazil. He was the second son of John VI, King of Portugal from 1816, and was born at Lisbon, Oct. 12, 1798. In 1807 the royal family fled to Brazil before the invading armies of France. There John VI, on the death of his mother, Maria I, was crowned King of Portugal, and Dom Pedro, heir apparent since the death of his elder brother (1801), attained much influence in politics in spite of his youth and his rather irregular education. In 1821 King John returned to Portugal and Dom Pedro was made Regent of Brazil. He soon threw in his lot with the Brazilian national party, which opposed the reactionary policy of the Portuguese Cortes. Finally, when Dom Pedro was ordered to return to Portugal, he declared the independence of Brazil and was crowned Emperor on Oct. 22, 1822. The slight resistance made by Portugal was easily overcome, and in 1825 the mother country acknowl-

edged the independence of Brazil. The popularity of the Emperor, which was at first very great, was gradually weakened by his ruthless suppression of opposition to his régime and his endeavor to establish despotic power. His promulgation of a new constitution in 1824 did little to strengthen his position, and he was forced to assemble the first Brazilian Congress in 1826. In 1828 the Province of Uruguay succeeded in establishing its independence of Brazil. Opposition to the government increased, and Pedro at length, April 7, 1831, abdicated in favor of his son, Pedro II, and went to Europe. He had been proclaimed King of Portugal upon the death of his father, in 1826, but had resigned the throne in favor of his daughter, Donna Maria da Gloria, who had been set aside by her uncle, Dom Pedro's younger brother, Miguel (q.v.). The ex-Emperor invaded Portugal in the early part of 1832 with an army largely made up of English and French volunteers, to make good his daughter's title to the throne. He occupied Oporto in July, and a year later made his entry into Lisbon after his admiral, Sir Charles Napier, had vanquished the fleet of Dom Miguel off Cape St. Vincent. The usurper was forced to abandon all claims to the throne in 1834. In August, 1834, Dom Pedro was chosen Regent of the Kingdom, but he died on September 24 of the same year, two days after the coronation of the young Queen, Donna Maria. Consult: J. Armitage, *History of Brazil . . . 1808 to . . . 1831* (2 vols., London, 1836); T. C. Dawson, *South American Republics* (New York, 1903); G. F. White, *A Century of Spain and Portugal: 1788-1898* (London, 1909).

PEDRO II (?1174-1213). King of Aragon, a brave soldier and a gifted troubadour. He succeeded his father, Alfonso II, in Aragon and Cataluña in 1196, and in France he secured the lordship of Montpellier. He was crowned at Rome in 1204 and promised to send a yearly tribute to the papal chair. His efforts to impose a new tax on his people aroused opposition on the part of the nobility and the towns and these formed a league against him. In 1212 he entered into an alliance with the kings of Castile and Navarra against the Almohades (q.v.), which resulted in the great victory of Las Navas de Tolosa on July 16. The next year he crossed into France to aid the Albigenses against Simon de Montfort (q.v.), and was killed at the battle of Muret, Sept. 2, 1213.

PEDRO II (DOM PEDRO DE ALCANTARA) (1825-91). An Emperor of Brazil, born in Rio de Janeiro. He was the son of Emperor Pedro I who when his son was but five years old was forced to abdicate in his favor (April 7, 1831). The years of his minority, when Brazil was governed by a regency, constituted the most stormy period of the country's history. He was declared of age in 1840, was crowned in 1841, and married in 1843 Theresa Christina, sister of Ferdinand II of the Two Sicilies. His sons died in childhood and his daughter Isabella (q.v.) became heiress to the crown. The early years of the reign of Pedro II were marked by revolutionary disturbances within the country and complications with the neighboring South American states. Revolts in the provinces of São Paulo and Minas Geraes were suppressed in 1842, as were similar insurrections in Rio Grande do Sul in 1845 and Pernambuco in 1849. In 1851 Brazil assisted Gen. José de Urquiza, Governor of Entre Ríos, in his struggle against

Rosas, the Dictator of Buenos Aires, and was instrumental in bringing about the fall of the Dictator. A five years' struggle in conjunction with Uruguay and the Argentine Republic against Francisco Solano López (q.v.), the Dictator of Paraguay (1865-70), ended in the triumph of the allies. In 1867 Dom Pedro opened the Amazon to the commerce of all nations. In 1871 a law was passed for the gradual abolition of slavery and the question of abolition continued to be agitated until 1888, when a law was passed providing for immediate emancipation. This act drove the rich planters into the Republican ranks, and as a result of a revolution instigated by the officers of the Brazilian army, Dom Pedro was forced to abdicate and a republic was proclaimed on Nov 15, 1889. A pension was conferred on the ex-Emperor and he was sent to Europe on a government vessel. Dom Pedro spent the remaining years of his life in France, and died in Paris, Dec. 5, 1891. Dom Pedro, who ordinarily ruled through responsible ministries calling to power the Conservatives and the Liberals, gave Brazil an enlightened and progressive administration. He was a man of wide culture, and Brazil made great progress under his guidance. He traveled extensively, both in America and in Europe, and devoted much time to studying systems of government and education. Consult B. Mossé, *Dom Pedro II, empereur du Brésil* (Paris, 1889), and T. C. Dawson, *The South American Republics* (New York, 1903).

PEDRO CAMPAÑA. See KEMPENEER, PETER DE.

PEDRO THE CRUEL (1334-69). King of Castile and León from 1350 to 1369. He was the son of Alfonso XI and Maria of Portugal, and was born at Burgos, Aug. 30, 1334. On his father's death Pedro succeeded to the throne without opposition. He was greatly influenced by his mother, and by Albuquerque, his favorite. His bastard brother, Henry of Trastamare (q.v.), plotted against him constantly. But the great opposition which he encountered was due to his marriage, in 1353, to Blanche of Bourbon, whom he abandoned after three days, and a second marriage in 1354 to Juana de Castro, whom he abandoned after two days. The friends of both joined his brothers. He was taken prisoner in 1354, but soon escaped and took cruel revenge. From 1357 to 1361 he was engaged in a war with Pedro IV of Aragon. Henry of Trastamare, who had fled to France, returned (1366) at the head of a body of exiles, reinforced by Bertrand du Guesclin (q.v.) with an army of mercenaries and aided by Aragon, France, and the Pope. Pedro prevailed upon Edward, the Black Prince, to espouse his cause. Edward invaded Castile in the spring of 1367, defeated Henry and Du Guesclin at Najera, and restored Pedro to the throne. But the King disgusted his chivalrous ally by his cruelty to the vanquished and paid no heed to his remonstrances; Edward accordingly repassed the Pyrenees and left the treacherous monarch to his fate. The whole Kingdom groaned under his cruelties; rebellions broke out everywhere, and in August, 1369, Henry returned. Pedro's forces were routed at Montiel and he himself was compelled to retire for safety within the town, whence he was treacherously decoyed and captured by Du Guesclin. He was carried to a tent, where a quarrel took place between him and Henry, in which the latter killed Pedro. Consult J. Catalina García,

Castilla y León durante los reinados de Pedro I, Enrique II, Juan II, Enrique III, vol 1 (Madrid, 1891), and Burke, *A History of Spain*, vol 1 (London, 1895). An entertaining account is to be found in Prosper Mérimée, *Histoire de D. Pedro I, roi de Castille* (Paris, 1843).

PEEBLESSHIRE, pē'b'l-shēr, or TWEEDDALE. A county of southeast Scotland (Map: Scotland, E 4). Area, 348 square miles. The surface generally is mountainous, 450 feet above the level of the sea at the lowest point, attaining a maximum of 2754 feet in Broadlaw. The principal river is the Tweed (whence Tweeddale) and its affluents. The arable lands in the valleys produce cereals and green crops, the highlands being chiefly pastoral. Coal is mined and there are deposits of ironstone and limestone. The many streams are well stocked with fish. Woolens are manufactured. Capital, Peebles. Pop., 1901, 15,066; 1911, 15,258. Consult Chambers, *A History of Peeblesshire* (Edinburgh, 1864).

PEEKSKILL. A village in Westchester Co., N. Y., 41 miles north of New York City, on the east bank of the Hudson River, just below the Highlands, and on the New York Central and Hudson River Railroad (Map: New York, B 2). It has several private secondary schools, the Field Library, Helping Hand Hospital, St. Joseph's Home, a House of the Good Shepherd, St. Mary's School (Protestant Episcopal), Peekskill Military Academy, and the State Military Camp. There are manufactures of stoves, oil-cloth, fire brick, foundry facings, charcoal products, hats, underwear, yeast, whisky, etc. The water works are owned and operated by the municipality. Peekskill, settled in 1764, derives its name from Jans Peek, an early Dutch navigator. It was incorporated as a village in 1816. Near it is the famous Robinson house, the headquarters of Generals Putnam and Parsons in 1778-79 and of Arnold in the summer of 1780. It was here that Arnold first learned of the capture of André. Pop., 1900, 10,358; 1910, 15,245; 1915 (State census), 15,491.

PEEL. A seaport town and a favorite watering resort on the west coast of the Isle of Man (Map: England, B 2). It was formerly called Holm. Its fisheries are productive and the building of vessels of small tonnage and the manufacture of nets, sails, and ropes are carried on extensively. At the north extremity of the bay on which it stands are several grotesque and romantic caverns. The south extremity is formed by St. Patrick's Island, which contains the ruins of Peel Castle, described in Scott's *Peveril of the Peak*. The castle was formerly the frequent residence of the earls of Derby, then lords of the Isle of Man, and is expressly named in the original grant of Henry IV to the Stanley family. It incloses a round tower and the ruins of the cathedral of St. German, beneath which is a strong subterranean dungeon, where many notable persons were imprisoned. Pop., 1901, 3304; 1911, 3920.

PEEL, ARTHUR WELLESLEY, VISCOUNT (1829-1912). An English public official, son of Sir Robert Peel. He studied at Eton and at Balliol College, Oxford, where he graduated in 1852. From 1865 to 1895 he was a Liberal member of the House of Commons, of which he was also Speaker in 1884-95. When Gladstone formed his first ministry Peel served as parliamentary secretary to the Poor Law Board (1868-71), as secretary to the Board of Trade

(1871-73), and as patronage secretary to the Treasury (1873-74), i.e., the whip of his party. In 1880 he held an undersecretaryship in the Home Department. In 1895 he was raised to the peerage and in 1904 was chairman of the British Commission to the St. Louis Exposition.

PEEL, PAUL (1860-92). A Canadian genre and landscape painter, born in London, Ontario. He studied at the Pennsylvania Academy of Fine Arts, the Royal Academy, London, and in Paris under Gérôme and Benjamin Constant. He achieved great skill as a colorist, especially in flesh tints as shown in nude children, his favorite subjects being scenes from child life, but he also painted landscapes with fine light effects. In 1890 he was awarded a gold medal in Paris for "After the Bath," which was acquired by the National Gallery at Budapest, Hungary. Queen Alexandra bought his "Two Friends" for Buckingham Palace, and "Fording the Stream" hangs in the City Hall, Toronto.

PEEL, SIR ROBERT (1788-1850). An eminent British statesman. He was born near Bury, Lancashire, on Feb. 5, 1788, the eldest son of Robert Peel (created Baronet in 1800), a wealthy cotton spinner. Peel was educated at Harrow and at Christ Church, Oxford, graduating from the latter in 1808, with a first class in classics and in mathematics. He subsequently studied law at Lincoln's Inn. In 1809 he obtained a seat in the House of Commons for the close borough of Cashel and began his political career by supporting the Tory ministry of the Duke of Portland. In 1810 he was appointed Undersecretary for War and the Colonies. In 1812, Lord Liverpool having meanwhile become Prime Minister, Peel became Chief Secretary for Ireland. In this capacity he had to consider three great questions—patronage, the preservation of order, and the maintenance of the Protestant ascendancy. In order to carry out these affairs successfully Peel ignored all personal ends and appointed Catholics and Protestants alike, thus strengthening his party. He created the Irish constabulary, dubbed Peelers, and became involved in such a bitter contest with Daniel O'Connell (q.v.) that he was driven in 1815 to send the agitator a challenge. The police, however, prevented the duel from taking place. Peel remained Irish Secretary until 1818, when he resigned. He had been chosen in 1817 the representative of Oxford in Parliament, an unusual honor for so young a man. He also began about this time to acquire a reputation as a financier and economist, and in 1819 he was appointed chairman of a special committee to consider the state of the Bank of England. As a result the so-called Peel's Act was adopted, according to which specie payments were resumed on May 1, 1823.

Peel had been a vigorous opponent of all acts intended to emancipate the Catholics, but about this time his views gradually began to change, though the process was so slow that after he had reentered the ministry at the close of 1821 as Home Secretary he continued to oppose the measures of Canning, the most powerful advocate of the Catholics, and in 1827, after Canning had become Prime Minister, Peel resigned. In 1828 he again became Home Secretary in the cabinet of the Duke of Wellington. By this time Peel decided to support Catholic emancipation, and on March 5, 1829, himself introduced a bill to effect this change, which soon became a law. As a result of this reversal of his views

Peel no longer remained the representative of Oxford, but sat for Westbury and subsequently for Tamworth. He brought about at this time numerous reforms in the laws, and in 1829 established a police force in London similar to that which he had established in Ireland.

In November, 1830, the cabinet was defeated on the question of parliamentary reform, and Peel for the first time belonged to the Opposition. He vigorously attacked the Reform Bills and played an important part in the various dramatic episodes of that time. On Dec. 9, 1834, he became Prime Minister, and tried to carry on the government in the face of a hostile majority, but on April 8, 1835, he was compelled to give up the contest. He began slowly, but surely, to build up the great Conservative party, so called since 1831, and gathered together under his leadership young men like Disraeli and Gladstone. In 1839 the Conservative leader was summoned on one occasion to form a cabinet, but Queen Victoria refused to submit to changes in the personnel of her household, and so the Whigs remained in power. They were, however, pressed on the one side by the new Radical party and the Anti-Corn Law League and on the other by O'Connell. They lost ground and in 1841 were compelled to dissolve Parliament. The general election that ensued was virtually a contest between free trade and protection, and the latter won. When the new Parliament met the Conservative party, headed by Peel, came into office. The Whigs desired a fixed and moderate duty on foreign corn; the Anti-Corn Law League wished free corn; while Peel was in favor of a modification of the sliding scale of duty which had existed since 1828. He introduced and carried in 1842, in spite of strong opposition, a measure based upon this principle. The deficit in the revenue, which had grown to about £2,000,000, next engaged his attention and led him to bring in a bill (1842) for the imposition of an income tax of 7d. in the pound, to be levied for three years on all incomes of £150 or more. To equalize still further the burdens of taxation, Peel commenced a revision of the general tariff and either abolished or lowered the duties on several very important articles of commerce. The great Bank Charter Act of 1844 was the measure to which Peel himself felt most attached and which he considered the most important and far-reaching of his administration. He also showed himself resolute in the repression of the malcontents of Ireland. O'Connell (q.v.) was tried for conspiracy, and though the judgment against him was set aside on appeal to the House of Lords, the influence of the agitator was broken. The first half of 1845 was marked by the increase of the allowance to Maynooth and its change into a permanent endowment instead of an annual grant, and by the foundation of the Irish nonsectarian colleges and other important measures. The potato rot in Ireland during the autumn, followed by a frightful famine, rendered cheap corn a necessity, if millions were not to starve. Cobden and the League redoubled their exertions. Lord John Russell announced the views of the Liberal party on the crisis, and Peel finally yielded. He told his ministerial colleagues that the Corn Laws were doomed and their repeal was inevitable. Some of them refusing to go along with him, he resigned; but after a few days he was recalled and the repeal was carried. He was, however, immediately

afterward defeated on a protection of life bill for Ireland. Not so much upon this account as because he felt that the course which he had pursued had produced a dissolution of the old ties of party and that he could not expect for some time to find himself at the head of a strong government, Peel retired from office in June, 1846, giving place to a Liberal administration under Lord John Russell, to which he gave an independent but general support as the leader of a middle party rather than Liberal or Conservative. In the critical times of 1847-48 he was one of the most important props of the government, whose free-trade principles he had now completely accepted. His ecclesiastical policy had also undergone a remarkable change, and he now frankly supported the Liberals in their efforts to carry an act for the repeal of the Jewish disabilities. On June 28, 1850, he spoke with great eloquence in the debate on Lord Palmerston's Greek policy. On the following day he was thrown from his horse in Hyde Park and was so much injured that he died on the evening of July 2, 1850.

Bibliography. The best authorities for a study of Peel are: *Collection of Speeches Delivered in Parliament* (4 vols., London, 1853); Stanhope and Cardwell, *Memoirs of Peel* (ib., 1857); *Sir Robert Peel: His Life and his Private Correspondence*, edited by C. S. Parker (3 vols., ib., 1891). A number of biographies of Peel exist. Among the best may be named: Taylor and Mackay, *Life and Times of Sir Robert Peel* (London, 1846-50); Thomas Doubleday, *The Political Life of Sir Robert Peel* (ib., 1856); Sir Lawrence Peel, *Life and Character of Sir Robert Peel* (ib., 1860); F. P. G. Guizot, *Sir Robert Peel: Etude d'histoire contemporaine* (ib., 1856); also J. R. Thursfield, *Peel*, in "Twelve English Statesmen Series" (ib., 1891); Walter Bagehot, "The Character of Sir Robert Peel," in *The English Constitution and Other Political Essays* (New York, 1903); Bernard Holland, *The Fall of Protection, 1840-1850* (London, 1913).

PEELE, GEORGE (c.1558-c.1597). An English dramatist. He was educated at Christ's Hospital School, where his father was a clerk, and at Christ Church, Oxford, graduating B.A. in 1577 and M.A. in 1579. On returning to London he was driven from the precincts of Christ's Hospital owing to his dissipated conduct. He seems to have been a skillful player as well as a playwright. His chief plays are the *Arraignement of Paris*, performed before the Queen probably in 1581; *Edward I* (printed 1593), one of the earliest historical plays in English; *The Battle of Alcazar* (printed 1594); *The Old Wives' Tale* (printed 1595); and the richly Oriental *David and Bethsabe* (printed 1599). Though Peele's dramatic work has less importance than Greene's and Marlowe's, it yet helped prepare the way for Shakespeare. Peele wrote some pageants also, and among his miscellaneous writings are "An Eclogue Gratulatory," addressed to the "Renowned Shepherd of Albion's Arcadia, Robert, Earl of Essex," and "The Beginnings, Accidents, and End of the Fall of Troy," important because Shakespeare may have got from it the idea of treating fully the theme of *Troilus and Cressida*. As a dramatist Peele lacked constructive skill and cannot be counted the equal of some contemporary Elizabethans. In the development of the English drama he was cer-

tainly not so influential as Greene or Marlowe. His blank verse in general is facile and remarkably fluent, but only at moments powerful and impressive. Though certain of his lyrics are beyond praise and of a freshness and charm that defy criticism, in lyric as in dramatic poetry he cannot be placed in the first rank. Consult his *Works*, edited by Bullen (London, 1888), and Ward, *History of English Dramatic Literature*, vol. i (ib., 1875).

PEENE, PÂNE, HIPPOLIET JAN VAN (1811-64). A Flemish dramatist. He was born at Caprijcke in East Flanders, studied medicine at Louvain, and practiced in Ghent from 1837 to his death. Besides a popular song, *De vlaamsche Leeuw*, for which the music was written by Karel Miry, Peene's work was for the stage. As early as 1835 he had written a French vaudeville, *La vieillesse de Stanislas*. His *Kaiser Karel en de berchemside Boer* (1847) is the first example in Flemish of the same genre. Of his later plays the more important are: *Brigitta* (1847), an opera; *Jan de Vierde* (1848), an historical drama; *Vader Cats* (1855); *Jellen en Mietje* (1858); as well as texts for French opera. His collected works in 38 volumes appeared at Ghent (1880-82).

PEEP'ER. One of the small tree frogs which in early spring are heard peeping all over the country as the sexes gather in the ponds and puddles for breeding purposes. The first voice heard in this chorus of early March in the northern United States is that of Pickering's or the little yellow tree toad (*Hyla pickeringii*). In the Southern States a small greenish peeper, very common, is *Hyla squirella*.

PEEPING TOM OF COVENTRY. The only person in Coventry who disobeyed the injunction not to look out on the street while Lady Godiva (q.v.) rode by. The name has become a conventional term for an inquisitive person.

PEEPUL, PIPUL, or PIPPUL, pē'pūl (Hind. *pipal*, from Skt. *pippala*, long pepper,

PEEPUL.

sacred fig tree), *Ficus religiosa*. A species of fig (q.v.) known in Ceylon as the bo tree. It

somewhat resembles the banyan, but the branches do not root like those of that tree, and the leaves, rounded at the base, have long attenuated points which are considered special devices for carrying off the water from leaves, a necessary device in wet tropical forests. The tree, which often attains a height of 100 feet or more, is held sacred by the Hindus. (See *BO TREE*.) It is often planted for shade near houses and by the side of walls. The juice contains caoutchouc and is used by women as bandoline. Lac insects feed upon the tree, and much lac is obtained from it. The fruit is not much larger than a grape and, although edible, is not valued.

PEER (OF. *per*, *pair*, Fr. *pair*, peer, equal, from Lat. *par*, equal). A general name applied to the various members of the titled nobility of England. The peerage comprises the ranks of duke, marquis, earl, viscount, and baron. The dignity of the peerage, still hereditary, was in early times also territorial. Life peerages seem to have been not unknown at one time in England; but in 1856, in the case of the law lord Baron Wensleydale, the House of Lords ruled that his creation "for and during the term of his natural life" did not convey the privilege of a seat and a vote in their House. Women may be peeresses in their own right, either by creation or by inheritance. In France the great vassals of the crown were very early known as peers, while the legal fiction of a semi-equality with the King was still maintained; the title occurs under Robert I and Louis VII, though the earliest letters patent creating a peerage which are known are those issued by Philip IV in favor of Robert II, Count of Artois. Under Philip Augustus there were six lay peers and six ecclesiastical. When three of the lay peerages were extinguished by union with the crown, the King created new ones, at first of the blood royal, to counterbalance the ecclesiastical peerages. The policy of Richelieu and Louis XIV reduced the prerogatives of the peerage to a simple question of precedence, the debates over which occupy such a large part of Saint-Simon's memoirs. Their only privilege was that of sitting in the parliaments and being judged only by these high courts. At the Revolution there were 49 peerages, including five princes of the blood, six spiritual peers (the same archbishops as in the Middle Ages), and 38 lay peers, ranging in seniority from Uzès, 1572, to Aubigny, Choiseul, and Coigny, 1787. The peerage was then suppressed. From 1814 to 1848 a House of Peers was in existence, modeled on the English Upper House. Hereditary succession was abolished in 1830.

PEER GYNT, pã'ër gunt, or yunt. A dramatic poem by Henrik Ibsen (1867). It has been called the Scandinavian *Faust*. Grieg composed a suite named from the poem and suggested by its theme.

PEERLKAMP, pãrl'kãmp, HOFMAN PETER (1786-1865). A prominent Dutch Latinist and critic. He was born at Groningen, studied there and at Leyden, where, after teaching in Haarlem and Dockum, he became professor of classics and ancient history (1822). This chair he resigned in 1848 because of ill health. As a classical scholar he had a remarkably brilliant style and a purely subjective standard of criticism which led him to judge as interpolations much of Latin poetry. Peerlkamp edited Horace's *Odes* (1834; 2d ed., 1862), his most famous work; Vergil's *Æneid* (1843); Horace's *Ars Poetica*

(1845) and *Satires* (1863), as well as Tacitus' *Agricola* (1827; 2d ed., 1864) and the works of Xenophon of Ephesus (1818); and he wrote much on the history of Dutch literature and classical scholarship. He founded (1825) the *Bibliotheca Critica Nova*. Consult Leopold, *Studia Peerlkampiana* (Groningen, 1892), and J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

PEERS, RICHARD (1645-90). An English author and translator. He was the son of a tanner and was born in Lisburn in the County of Antrim, Ireland. Disliking his father's trade, to which he was apprenticed, he ran away to England, where he was sent to school by an uncle. He graduated B.A. from Christ Church, Oxford, in 1668, and M.A. in 1671. In recognition of his scholarship he was elected esquire bedell in the faculty of arts (1675) and afterward in the faculty of physic. Under the supervision of Dr. John Fell (q.v.) he translated into Latin Anthony à Wood's *History and Antiquities of Oxford* (1674); unaided made the first catalogue of Oxford graduates under the title of *A Catalogue of Graduates in Divinity, Law, and Physic, etc.* (1689); and contributed to the famous *English Atlas* (vol. iv) of Moses Pitt, *The Description of the Seventeen Provinces of the Low Countries or Netherlands* (1682). He also published *Verses on Sundry Occasions* (1667). His life was passed in and near Oxford.

PEERYBIN'GLE, Mrs. In Dickens's *Cricket on the Hearth*, the devoted and cheery little wife of John Peerybingle. Her husband called her *Dot*, under which name Dion Boucicault's dramatization of the story was presented in 1862.

PEET, HARVEY PRINDLE (1794-1873). An American educator, born at Bethlehem, Conn. He graduated at Yale in 1822 and two years later became superintendent of the American Asylum for the Education of the Deaf and Dumb, the first institution of the kind in America. In 1831 he became president of the New York Institute for the Deaf and Dumb. He was the author of *A Course of Instruction for the Deaf and Dumb* (1844-46), *Legal Rights of the Deaf and Dumb* (1856), and of several other works on deafness and on insanity.

PEET, STEPHEN DENISON (1830-1914). An American archaeologist, born at Euclid, Ohio. He graduated at Beloit College in 1851, studied at Yale Divinity School (1851-53), and graduated from Andover Theological Seminary in 1854. Thereafter until 1895, when he removed to Chicago, he held various pastorates in Congregational churches in Wisconsin, Ohio, and Illinois. He founded in 1878 and thereafter was editor of the *American Antiquarian and Oriental Journal*. He also published: *The Clan Centres and the Clan Habitat of the Effigy Builders* (1891); *The Mound Builders: Their Work and Relics* (1892; 2d ed., 1903); *The History of the Explorations in the Mississippi Valley* (1896); *Prehistoric America* (3 vols., 1890-99); *Ancient Monuments and Ruined Cities* (1904); *Myths and Symbols* (1905); *Aboriginal Religions in America* (1905).

PEEWEE. See PEWEE; Plate of FLY-CATCHERS, and Colored Plate of EGGS OF AMERICAN SONG BIRDS.

PEE'WIT. See LAPWING.

PEFFER, WILLIAM ALFRED (1831-1912). An American journalist, legislator, and author, born in Cumberland Co., Pa. In 1853 he settled

in Indiana, in 1859 in Missouri, and later in Illinois. He enlisted in the Eighty-third Illinois Regiment in 1862, was mustered out as lieutenant in 1865, and, removing to Kansas, established the *Fredonia Journal* and the *Coffeyville Journal*. He had studied law while in the army, was admitted to the bar in 1865, and thereafter he was both journalist and lawyer. In 1874 he was elected to the State Senate, in 1880 was a Republican presidential elector, and in 1881 assumed the editorship of the *Kansas Farmer*. From 1891 to 1897 he represented the People's party in the United States Senate, being elected over John J. Ingalls, and in 1898 was nominated by the Prohibitionists for Governor of Kansas. After the expiration of his term he engaged in statistical and compilation work for Congress. As Senator and writer he maintained that "the farmers by virtue of their vocation ought to control the politics of this country." Among his publications are: *Peffer's Tariff Manual* (1888); *The Way Out* (1890); *The Farmer's Side* (1891); *Americanism and the Philippines* (1900); *Rise and Fall of Populism in the United States* (1900).

PEGASUS. A northern constellation lying southwest of Andromeda. It was supposed by the ancients to represent the winged horse which sprang from the blood of Medusa. The four bright stars, α , β , and γ Pegasi, and α Andromeda, outline the "great square of Pegasus" and render the constellation easy of detection.

PEGASUS (Lat., from Gk. Πήγασος; connected with πηγός, *pēgos*, strong, πηγύναι, *pēgynai*, to fasten; popularly derived from πηγή, *pēgē*, spring). In Greek legend, a winged horse, begotten by Poseidon from the Gorgon Medusa, and with Chrysaor springing from her neck when she was beheaded by Perseus. Later, by the aid of Athena, he was caught at the spring Pirene, in Corinth, by Bellerophon (q.v.), who used him in his conflict with the Chimæra (q.v.) and in his later wars. Afterward he was said to have flown to heaven, and later writers told how he had been placed among the stars. The Alexandrian poets seem to have been the first to attribute the spring Hippocrene on Mount Helicon to a blow of Pegasus' hoof, and the same story is found in connection with Aganippe and several other fountains in Greece. This story brought Pegasus into connection with the Muses of Mount Helicon, and as the spring-inspired poets we find them honoring Pegasus for his gift. As the horse on which the poet is carried from the earth into the realms of poetic fancy, Pegasus is unknown to antiquity. That conception seems to appear first in Boiardo's *Orlando innamorato*. Consult F. Hannig, "De Pegaso," in *Breslauer philologische Abhandlungen*, vol. viii (Breslau, 1902).

PEG-GOTTY. The name of a family in Dickens's *David Copperfield*, consisting of Clara, who married Barkis the carrier, her brother Dan, and nephew Ham, Yarmouth boatmen, who live in a remodeled barge with Little Emily and Mrs. Gummidge.

PEGMATITE (from Gk. πήγμα, *pēgma*, anything fastened together, from πηγύναι, *pēgynai*, to fasten). A coarse-grained rock of siliceous composition occurring in dikes or veins and generally in association with a parent mass of granite rock. Most pegmatites have the composition of a siliceous granite. They are made up chiefly of feldspar (orthoclase, microcline, plagioclase), quartz, and muscovite; but they

are also the home of many of the minerals containing rarer chemical elements, such, e.g., as boron, beryllium, uranium, cerium, etc. Pegmatites supply feldspar, which is used in porcelain and China ware and for other purposes, and mica, which finds many valuable applications. They are found by igneous agencies, being usually offshoots of some granite magma.

PEGOUD, pe-gō', ADOLPHE (1889-1915). A French aviator. He first attracted general attention in 1913 by originating the feat of flying upside down, diving through the air in spectacular fashion and, for the first time, "looping the loop" in an air craft. He used a Blériot monoplane. Pegoud had intended to visit the United States in 1914, but when the European War broke out he joined the French aviation corps. In August, 1914, his machine was riddled by the shots of the enemy; in March, 1915, he received the French military medal; and in the following month he performed a notable feat by destroying a German Taube and taking prisoners its pilot and observer. Altogether he had brought down six German air craft before he himself was killed.

PEGGRAM, GEORGE HERNDON (1855-). An American civil engineer, born at Council Bluffs, Iowa. After graduating from Washington University in 1877, he engaged in railroad and bridge engineering. He served as chief engineer of the Edge Moor Iron Company of Wilmington, Del., in 1880-86, as consulting engineer of New York City in 1886-89 and of the Missouri Pacific Railroad in 1889-93, and as chief engineer of the Union Pacific System in 1893-98, and, in New York City, of various transit interests after 1898. Pegram designed the Kansas City Elevated Railroad and the St. Louis Union Station, invented and patented in 1889 the Pegram truss for bridges, and in 1890 built the bridge across the Arkansas River at Fort Smith, Ark.

PEGGRAM, JOHN (1832-65). An American soldier, born at Petersburg, Va. He graduated at West Point in 1854 and was assigned to frontier duty with the First Dragoons. On Feb. 28, 1857, he was appointed first lieutenant. He served as assistant instructor of cavalry and took part in the Utah expedition of 1857-58. From 1858 to 1860 he was on leave, traveling and studying in Europe, and on his return served against the Indians in New Mexico. He resigned on May 10, 1861, and became a captain of cavalry in the Confederate army. In June and July he was lieutenant colonel in General Garnett's operations around Beverly in West Virginia and was captured at Rich Mountain (July 11). When exchanged, he was sent in July, 1862, to General Bragg in Mississippi as chief of engineers and afterward was chief of staff for Gen. E. Kirby Smith in Tennessee. He was made brigadier general of cavalry in November, 1862, was engaged at Murfreesboro, and commanded a division at Chickamauga. He was transferred to the Army of Northern Virginia, Early's division, Second Corps, and repulsed an attempt to turn the right Confederate flank at the Wilderness. He served in the campaign against Sheridan in the Shenandoah in the fall of 1864 and was promoted major general. While on service around Richmond he was mortally wounded in the skirmish at Hatcher's Run in February, 1865.

PEGU, pé-gō'. A division of Lower Burma (q.v.), British India. Area, 13,258 square miles.

It comprises the districts of Pegu, Rangoon City, Hanthawaddy, Tharrawaddy, and Prome. It is watered by the Irrawaddy, the Rangoon, the Pegu, and the Sittang. The surface is uneven, attaining in the Aracan Yoma Mountains, on the west boundary, a maximum altitude of about 6000 feet. The climate is warm and humid, but not unhealthful. The soil is fertile, the river valleys are well cultivated and highly productive, and there are extensive forests of valuable trees. Rice is the principal crop, and teak timber is largely exported. The Peguans belong by race to the Mons (q.v.). Pop., 1901, 1,820,638; 1911, 2,073,737. Pegu was an independent Talaing kingdom until 1752; its subsequent history is merged with that of Burma (q.v.). It became British in 1862.

PEGU. The capital of a division of south Burma, on the Pegu River, 47 miles northeast of Rangoon (Map: Burma, C 3). It has a remarkable pagoda with a tower 324 feet high. Before its destruction by Alompsa in 1757 it was said to be a large, fine city of more than 100,000 inhabitants. There are a colossal recumbent figure of Buddha, and many ancient relics. Pop., 1901, 14,132; 1911, 17,104.

PÉGUY, pé'gu'é, CHARLES (1873-1914). A French poet and sociological writer, born at Orléans and killed in battle Sept. 5, 1914. He studied at the lycées of Orléans, Lakanal, and Louis-le-Grand and entered the Ecole Normale Supérieure in 1894. He began writing in 1897 under the pseudonym of Pierre Deloivre, using also that of Pierre Baudoin, and at the same time served as director of a Socialistic library. His struggle for the revision of the Dreyfus case brought him notoriety. In 1900 Péguy began publishing the *Cahiers de la Quinzaine*, interrupted in August, 1914, by the War. In this collection containing most of Péguy's work, we can follow his moral evolution. He will be best known probably for his beautiful, idealistic studies of Joan of Arc. He wrote: *De la cité socialiste* (1897); *Jeanne d'Arc, drame en trois actes: Domremy; les Batailles; Rouen* (1897); *Marcel, premier dialogue de la cité harmonieuse* (1898); *Notre jeunesse* and *Le mystère de la charité de Jeanne d'Arc* (both 1910); *Victor-Marie, comte Hugo*, and *Œuvres choisies*, prose (1911), crowned by the French Academy; *Le mystère des saints Innocents*; *Le porche du mystère de la deuxième vertu* and *De l'argent* (1912); *La tapisserie de Sainte-Geneviève et de Jeanne d'Arc* and *La tapisserie de Notre-Dame* (1913); *Choix de poésies* (1914).

PEHLEVI, pā'lā-vē, more correctly pā'r'lā-vē. See PAHLAVI LANGUAGE AND LITERATURE.

PEI-CHING, pā'ching'. See PEKING.

PEI-HO, pā'hō' or pī'hō' (Chin., white river). The most important river of north China (Map: China, L 4). It rises near the Great Wall north of Peking, flows southward, receiving several tributaries, past Tunghowfu, 12 miles east of Peking, to Tientsin, where it takes a southeastern course and falls into the Gulf of Pechili at Taku (q.v.), its course being wholly within the Province of Chili. At Tientsin it receives from the northwest the Hun-ho, swollen by the accession near its confluence with the Pei-ho of the waters of many rivers, with numerous feeders, from the west and southwest. Here, also, it connects with the Grand Canal. Its course is very tortuous, especially below Tientsin, the distance from that point to Taku by water being 80 miles, but only 35 by land. Its waters are

thick with silt, but are navigable by coast and river steamers as far as Tientsin and by native vessels above that point to Tunghowfu. There is a bar of stiff clay at its mouth, which greatly impairs its value as a waterway, and the water along the coast is so shallow that heavily laden vessels cannot approach nearer than 8 miles. The total length of the river is estimated at 350 miles.

PEILE, pēl, JOHN (1838-1910). An English philologist, born at Whitehaven, Cumberland. He studied at Christ's College, Cambridge, where he was fellow and lecturer in 1860 and in 1887 master. Peile took much interest in university extension and in the higher education of women. He published: *Introduction to Greek and Latin Etymology* (1869) and *Primer of Philology* (1877), both popular works; *Notes to the Tale of Nala* (1881); and a *History of Christ's College* (1910).

PEINE, pī'ne. A town in the Province of Hanover, Prussia, on the Fuse, 20 miles east of Hanover. It is a grain and cattle market, has breweries and manufactures iron, steel, sugar, furniture, malt, vinegar, textiles, and fertilizer. Pop., 1900, 15,400; 1910, 16,667.

PEINE FORTE ET DURE, pān fōrt à dur (OF., strong and hard punishment). A punishment formerly imposed by the laws of England upon persons who, on being arraigned for felony, refused to plead, stood mute or peremptorily challenged more than 20 jurors, which was considered a contumacy equivalent to standing mute. By the early English law an accused person must plead "guilty" or "not guilty" before he could be tried, and the form of coercion hereinafter described was devised to force an accused person to plead in case of his obstinate refusal.

In the beginning of the thirteenth century the penalty consisted merely of a long imprisonment and a low diet, persisted in until the prisoner submitted. However, by the reign of Henry IV it had become the practice to lay the accused on his back on a bare floor, place on his body as great a weight of iron "as he could bear, and more," and give him only the "worst" bread and water from the nearest stagnant pool until he consented to plead or died. During the fifteenth, sixteenth, seventeenth, and even the eighteenth centuries a number of cases are recorded of the infliction of the above punishment for "standing mute" on an arraignment for felony.

This form of coercion of a plea was finally abolished in 1772, by Stat. 12, Geo. III, c. 20, which provided that "standing mute" on an arraignment for felony should be considered as equivalent to conviction. This harsh rule was altered by Stat. 7-8, Geo. IV, c. 28, by the humane provision that a plea of "not guilty" should be entered in case of the refusal of a prisoner to plead, and this rule prevails everywhere to-day.

American records are stained by only one well-authenticated instance of the infliction of this torture. One Giles Cory, accused of being a witch, refused to plead on his arraignment and was pressed to death at Salem, Mass., in 1692. Consult Sir J. F. Stephen, *History of the Criminal Law of England* (3 vols., London, 1883).

PEIPUS, pī'pōs (Russ. Tchudskoye Ozero). A large lake in the Baltic Provinces of northwest Russia. It lies 30 miles south of the Gulf of Finland, into which it is drained through

the Narova River (Map: Russia, C 3). It is 45 miles long and 20 miles broad and connects southward through a narrow channel with Lake Pskov. Its banks are low and sandy and for the greater part wooded, and it is rich in fish, which supply the markets of St. Petersburg. The lake is deep enough (30 feet on the average, with a maximum of 90) for large vessels and is navigated by steamers. It was formerly the chief waterway between the Hanse towns of the Baltic and the interior of Russia.

PEIRCE, pērs, BENJAMIN (1809–80). An American mathematician and astronomer, born at Salem, Mass., April 4, 1809. He graduated at Harvard College in 1829. He became tutor there in 1831, professor of mathematics and physics in 1833, and Perkins professor of mathematics and astronomy in 1842, which position he held till his death. In 1849 he became consulting astronomer to the *American Ephemeris and Nautical Almanac*, and in 1855 one of the council to organize the Dudley Observatory, Albany. In 1867 he succeeded Prof. A. D. Bache as superintendent of the Coast Survey, in which service he continued till 1874. In his early life he was a contributor to the *Mathematical Miscellany* and also published the *Cambridge Miscellany of Mathematics, Physics, and Astronomy*, in which appeared his celebrated investigation of the motion of a top spinning on a plane surface. He also prepared a series of mathematical textbooks for the use of the university, and it was chiefly by his exertions that the Harvard Observatory was established and perfected. In 1851 he published in the *Astronomical Journal* a series of remarkable papers on the constitution of Saturn's rings, in which he considered the conditions of statical equilibrium of a transverse section of the ring and came to the conclusion that if there are separate rings they must be more numerous than Laplace had even supposed. (See SATURN.) In 1857 he published his *System of Analytical Mechanics*. Among his important contributions to mechanics may be mentioned his investigation of the forms of an elastic sac containing a fluid, a subject which led to the theory of analytic morphology. His contributions to mathematics are of the broadest and profoundest character. They are principally embraced in certain communications on *Linear Associative Algebra* to the National Academy of Sciences, which had been suggested by the publication by Hamilton in 1852 of his quaternions. These communications were collected in 1870, and 100 lithograph copies were published. They were reprinted in the *American Journal of Mathematics* (1882). Peirce was a member of various learned societies in Europe and America and in 1853 was president of the American Association for the Advancement of Science. He died at Cambridge, Mass., Oct. 6, 1880.

PEIRCE, BENJAMIN OSGOOD (1854–1914). An American mathematician and physicist, born at Beverly, Mass. He graduated at Harvard in 1876, studied in Leipzig and Berlin after acting as assistant in physics at Harvard for a year, taught in the Boston Latin School in 1880–81, and at Harvard was instructor (1881–84), assistant professor of mathematics and physics (1884–88), and then Hollis professor of mathematics and natural philosophy. In 1912 he was elected president of the American Physical Society. He contributed to the *Proceedings of the American Academy of Sciences* many papers on

magnetism, electricity, and heat and published *Elements of the Theory of the Newtonian Potential Function* (1886; 3d ed., 1906), and *A Short Table of Integrals* (1889; 2d rev. ed., 1910; abridged ed., 1914).

PEIRCE, BRADFORD KINNEY (1819–89). An American Methodist Episcopal clergyman and social worker, born at Royalton, Vt. Graduating at Wesleyan University, Connecticut, in 1841, he joined the New England Conference five years later. He was editor of the *Sunday-School Messenger* and *Sunday-School Teacher* (1844–45), agent of the American Sunday School Union (1854–56), Massachusetts State Senator (1855–56), and superintendent and chaplain of the State Industrial School, Lancaster, Mass. (1856–62). For 10 years he served as chaplain of the house of refuge on Randall's Island, New York, then for 16 years as editor of *Zion's Herald*, and in 1889 as financial agent for Boston University. He wrote: *The Bible Scholar's Manual* (1847); *Notes on the Acts* (1848); *The Eminent Dead* (1851); a series of question books for Sunday-school scholars (1849–52); *Trials of an Inventor* (1866); *The Word of God Opened* (1868); *A Half Century with Juvenile Delinquents* (1869).

PEIRCE, CHARLES (SANTIAGO) SANDERS (1839–1914). An American physicist and philosopher, born at Cambridge, Mass. He graduated at Harvard in 1859 and at the Lawrence Scientific School in 1863. Entering the United States Coast Survey, in 1872 he conducted a valuable series of pendulum experiments to determine the density and shape of the earth. He also studied the problem of wave lengths of light in connection with L. M. Rutherford. Professor Peirce was a lecturer on logic at Johns Hopkins and Harvard universities and in Lowell Institute courses in Boston. In 1876 he was elected a member of the National Academy of Sciences. He is author of *Photometric Researches* (1878), *Studies in Logio* (1883), and many special articles on logic and other subjects. It was Peirce who, according to William James, first introduced the term "pragmatism" into philosophy (1878), in an article entitled "How to Make our Ideas Clear" (*Popular Science Monthly*, January, 1878; Fr. trans., *Revue Philosophique*, January, 1879). James says, however: "The principle lay entirely unnoticed by any one for 20 years until I, in an address before Professor Howison's Philosophical Union at the University of California, brought it forward again and made a special application of it to religion."

PEIRCE, GEORGE JAMES (1868–). An American botanist. He was born at Manila, Philippine Islands, graduated from the Lawrence Scientific School (Harvard) in 1890, and in 1892–94 studied at the universities of Bonn, Leipzig (Ph.D., 1894), and Munich. After two years as assistant professor of botany at Indiana University he was assistant professor (1897–1900), associate professor (1900–10), and thereafter professor of botany at Leland Stanford. Peirce served as collaborator of the United States Forest Service in 1909–10 and as a special agent of the Department of Justice in 1910–11. He is author of *Textbook of Plant Physiology* (1903).

PEIRCE, JAMES MILLS (1834–1906). An American mathematician, born at Cambridge, Mass. He graduated at Harvard in 1853 and after several years of tutoring became an assist-

ant professor of mathematics there in 1861. In 1869 he became full professor and in 1885 was appointed Perkins professor. He served also as dean of the graduate school in 1890-95 and as dean of the faculty of arts and sciences in 1895-98. Among his publications are: *Text-Book of Analytic Geometry* (1857); *Three and Four Place Tables of Logarithmic and Trigonometric Functions* (1871); *The Elements of Logarithms* (1874); *Mathematical Tables, Chiefly to Four Figures* (1879).

PEIROL, pá'ról' (?-c.1150). A French troubadour, so called from his birthplace, Peirol in Auvergne. The Dauphin, Robert of Auvergne, received him at his court. But there Peirol met and loved Robert's sister, Assalide, or Sail de Claustra as he calls her in his verse, and according to the Provençal *Life* of the poet for a time lived at court as her favorite with Robert's knowledge, but was finally exiled by the jealous Dauphin. In the Crusade of 1189 he seems to have taken an active part. On his return he lived at Montferrat, whence in all probability he made a pilgrimage to the East. If we are to believe the manuscript *Life*, he settled at Montpellier and there married and died. His poems, 30 canzones and his part of a few tenzons, are especially valuable as contributions to the history of the spirit of the Crusades.

PEISANDER. See PISANDER.

PEISHEVA, pá'she-vá. See PESHWA.

PEISIS/TRATUS. See PISISTRATUS.

PEIXOTO, pá-shô'tô, FLORIANO (1842-95). A Brazilian soldier and politician, born at Pico, Alagôas. He entered the army as a private, rose rapidly, and distinguished himself in the war with Paraguay. In 1889 he assisted Fonseca in establishing the Republic and after serving as Minister of Finance was elected Vice President in 1891. Fonseca resigned from the presidency in the same year, and Peixoto took his place. As leader of the military party, he endeavored to perpetuate the militarism of his predecessor and failed to work in harmony with Congress. In 1893 a formidable naval revolt against the administration of Peixoto broke out under the leadership of Admirals Custodio de Mello and Saldanha da Gama (qq.v.), accompanied by an insurrection in Rio Grande do Sul. The revolution was crushed after eight months of bloody fighting, and in 1894 Peixoto surrendered the presidency to Prudente de Moraes Barros. Consult Luiz José Pereira da Silva, *Florianô Peixoto* (Rio de Janeiro, 1894). See BRAZIL.

PEIXOTO, IGNACIO JOSÉ DE ALVARENGA (1744-93). A Brazilian poet, born in Rio de Janeiro. He was educated in Portugal at the University of Coimbra and served as district judge at Cintra. He returned to Brazil in 1776 and was made a judge in São-João-d'El-Rei, in the interior Province of Minas Geraes. He was also a cavalry colonel and in 1789 was one of the 12 arrested for implication in the republican plots. Kept for two years in a dungeon without trial, his death sentence was commuted to deportation to Angola in Portuguese Africa. Some of his poems, which rank among the best in the Portuguese tongue, were published in Paris in 1865, under the title *Obras poeticas, colligidas, annotadas, precedidas de juizos criticos, e de uma noticia sobre o auctor e suas obras, com documentos historicos, por J. Norberto de Sousa S.*

PEIXOTTO, pêsh-ô'tô, ERNEST CLIFFORD

(1869-). An American decorative, architectural, and landscape painter, also an author. He was born in California and studied in Paris under Benjamin Constant and Lefebvre. He lived many years in Europe, exhibiting frequently at the Paris Salon, and in later years exhibited also in America. Among his best paintings are the "Woman of Rijsoord" (1895) and a mural frieze, "Le morte d'Arthur," for the library of Henry Everett, near Cleveland (1911). Besides contributing to *Scribner's Magazine* and other periodicals, he illustrated Roosevelt's *Life of Cromwell* and published, with his own illustrations, *By Italian Seas* (1906), *Through the French Provinces* (1910), *Romantic California* (1911), and *Pacific Shores from Panama* (1913). He became an associate of the National Academy in 1909. Peixotto excels in outdoor effects and in architectural drawings that show great accuracy and artistic feeling, with a leaning towards impressionism.

PEK'AN, or PENNANT'S MARTEN. See FISHER.

PEKEA (pê-kê'a) **TREE**. A tropical American tree. See CARYOCAR.

PEKIN. The capital of China. See PEKING.

PE'KIN. A city and the county seat of Tazewell Co., Ill., 9 miles south by west of Peoria, on the Illinois River and on the Cleveland, Cincinnati, Chicago, and St. Louis, the Chicago and Alton, the Illinois Central, the Atchison, Topeka, and Santa Fe, the Chicago, Peoria, and St. Louis, and other railroads (Map: Illinois, E 4). It has a public library, Mineral Spring Park, and fine government, court, and public-school buildings. In the vicinity are productive veins of coal and fertile agricultural lands. The city is a noted grain market and controls an important shipping trade by rail and water. Its manufactures also are extensive and include agricultural implements, cooperage products, wagons, carriages, starch, glucose, spirits, alcohol, ammonia salts, brick and tile, organs, foundry products, planing-mill products, etc. Settled in 1829, Pekin was incorporated first in 1850. It adopted the commission form of government in 1911, under which power is vested in a mayor and four commissioners elected quadrennially. The street railway is controlled by the municipality. Pop., 1900, 8420; 1910, 9897; 1914 (U. S. est.), 10,524.

PEKING, pè'king' or pà'king' (Chin., Northern Capital). The capital of the Republic of China, situated in the Province of Chili (see PECHILI) (Map: China, L 3). It was the seat of the Imperial government from 1409 to 1912, and is called Peking, or Northern Capital, to distinguish it from Kianningfu, south, of the Yang-tse, which had been the seat of the capital from 1368 to 1409, and is now known as Nanking (q.v.).

Peking is a walled and moated city, with an area of about 25 square miles, and is situated in a sloping sandy plain about 12 miles west of the Pei-ho (q.v.), 70 miles southeast of the Great Wall, and 100 miles from the Taku Forts, where the Pei-ho enters the Gulf of Pechili. The Imperial Observatory stands in lat 39° 54' 31" N. and in long. 116° 28' 24" E. of Greenwich. The elevation above the sea is about 120 feet. The city is surrounded on three sides by mountains distant from 10 to 30 miles, the mountains in the west providing cool breathing spots for the foreign residents in summer as well as an abundant supply of coal for all seasons.

Peking is in the main healthful. The climate is that of north China generally, intensely cold in winter (zero and below), the city, however, being sheltered somewhat by the high walls, while the heat in summer is great, cooling winds being barred out by the height of the walls. The city is connected by railway with Tientsin, Shanhai-kwan, and Mukden and thus has rail connection with Europe by means of the Great Siberian Railway.

General Description. Peking consists of two parts of different shapes, sizes, and dates: the Tatar, or Inner, city, which lies to the north; and the Chinese, or Outer, city, which adjoins the other on the south, the south wall of the Tatar city forming the main part of the north wall of the Chinese city. The former, which is nearly square, has a circuit of about 12.3 English miles, and the latter, which has its greatest extension from west to east, is an imperfect parallelogram measuring 5 miles by 2. The walls of both cities are of earth and concrete, faced within and without with brick. Those of the Tatar city are 40 feet high, 62 feet thick at the base, and 34 at the top, access from within to the top being by stone-paved ramparts. The walls are strengthened at intervals of 60 yards by huge buttresses which project outward 50 feet, and the parapets of both walls and buttresses are loopholed and crenelated. The Chinese city walls are only 30 feet high and 25 feet thick at the base. These walls are pierced by 16 gates, nine of which are in the Tatar city (three in the south wall, communicating with the Chinese city, and two in each of the other three sides). Of the seven gates in the Chinese city, three are in the south wall, one in the east wall, one in the west, and two in those portions of the north wall which project east and west for a quarter of a mile beyond the common wall of the Tatar and Chinese cities and open towards the north. Each gate is protected by a demilune or enceinte and is surmounted by a lofty three-storied tower, 99 Chinese feet (about 119 English feet) in height and covered with green glazed tiles. The Ch'ien mén, or Front Gate, in the centre of the south wall of the Tatar city, like the Yungting Gate of the south wall of the Chinese city, has three entrances, of which the one in the centre was formerly reserved for the Emperor. All gates are closed at sunset.

The Chinese city, built in 1543, is newer than the Tatar city, which was built by Kublai Khan in 1267-71. It contains many vacant spaces, but the bulk of the population is here. Entering by the Yungting Gate in the south wall, a roadway 2 miles in length leads due north to the Ch'ien-mén, or Front Gate, the main entrance to the Tatar city. On the right or east side of this roadway stands the inclosure (1 square mile in extent) containing the Altar of Heaven, surrounded with temples and shrines, including the circular triple-roofed Temple of Heaven, about 119 English feet high. It was burned down in 1889, but has been rebuilt, Oregon pine being used for the pillars. It is roofed with blue porcelain tiles. Here, at midnight of the winter solstice, the Emperor, after due fasting and prayer, was wont to worship Shang-ti, the Supreme Ruler, with prayer, hymns, prostrations, and burnt offerings of oxen, sheep, hares, etc., and of silk, jade, and other precious things. On the west side of the roadway stands the Temple of Agriculture, dedicated to Shin-nung (q.v.), the Divine Hus-

bandman. In this spot every year at the "opening of spring" the Emperor plowed a furrow or two and thus inaugurated for the year the principal industry of his people. In the Chinese city most of the mercantile business of the city is carried on. It also has a powder factory, a former Imperial pottery, a mosque, and many theatres. Here also is the fashionable promenade known as Booksellers Street, where curios of all sorts, precious stones, etc., can be bought. Northward about halfway towards the entrance to the Tatar city is a magnificent marble bridge, an essential, according to the requirements of Fung-shui. Within the Tatar city the first important cross street to the right is Legation Street, a macadamized thoroughfare, extending southeastwardly. Here are the foreign legations, the headquarters of the Chinese maritime customs, the hotel, the two foreign banks, etc.; and here the fury of the bloody Boxer outbreak concentrated as far as the city of Peking was concerned.

Immediately north of the Great Gate is a paved square bordered by a stone palisade. The Mongol market is found here. North of this square is the outer gate leading to the part of the city formerly the Hwangch'ing, or Imperial City, walled and towered like the Tatar city itself. From this a wide avenue leads for a quarter of a mile to the inner gate, within which right and left are seen the temples of ancestors and of grain. A mile and a half farther brings us to the entrance of the Tsze-kinch'ing, or Purple Forbidden City, a great walled inclosure with towers on the corners and over the gates, 1 square mile in extent, containing the Imperial Palace and its pleasure grounds and gardens as well as the numerous reception halls, pavilions, and offices formerly required by the Emperor and his high officers of state in conducting the affairs of the Empire, all roofed with yellow porcelain tiles. North of all this is the beautiful, finely wooded artificial hill called King-shan, or Prospect Hill, 170 feet high, with five peaks, each having a Buddhist temple on top, the whole surrounded with a park a mile in circuit. Continuing northward, the traveler passes through the "back gate" into the former Imperial City. Northward still is the gate leading from the Imperial into the Tatar city.

It is seen that the Tatar city is really a nest of cities, with the former Forbidden City in the centre, the Forbidden City being surrounded by the former Hwang, or Imperial City (6 miles in circuit), containing government offices, temples, pleasure grounds, a beautiful artificial lake on the west side, the White Ming Pagoda built on the spot where the last Emperor of the Ming dynasty hanged himself (1643), the Pei-t'ang, or Roman Catholic cathedral, and many elegant residences of princes and of officers of the government. The Tatar city thus surrounds both the old Forbidden and Imperial cities. It was originally intended for Manchus alone. It contains the public offices of the former Imperial régime, consisting of the eight boards or government departments, including the Foreign Office, or Tsung-li Yamen, now called the Waichiaopu, the Imperial Censorate, the site of the Han-lin (q.v.), adjoining the British Legation on the north and burned down with its unreplaceable libraries during the Boxer disturbances; the Imperial University; the Examination Hall, with its 10,000 cells where were held the triennial competitive literary examinations of the

old Chinese classical system. Other places of interest are the Imperial Observatory; the Christian mission houses, churches, and schools in different parts of the city; Confucian, Buddhist, Taoist, and Lamaistic temples; a great drum tower, etc. There is in addition the temple erected in 1578 to house the great bronze bell, 17 feet high, 12 feet, 8 inches in diameter, weighing 87,000 pounds, cast in the early years of the fifteenth century, and covered within and without with quotations from the Buddhist scriptures. There is also another Roman Catholic cathedral. It is situated in the southwest part of the city. The Ketteler Memorial Arch was dedicated in January, 1903.

The principal streets of Peking are lined with shops, gorgeously painted, and decorated with great pendent signs with gilt characters. At times the streets are very noisy and full of activity. Besides the hurrying to and fro of mandarins and their followers, government messengers, envoys from the provinces, Mongols with their big Bactrian camels, yellow-robed Tibetan and Mongol lamas, itinerant venders of amusement or of infallible medicines or of things to eat or wear, make up a scene of great interest. The principal conveyances are the sedan chair and the springless covered carts, politely called "carriages." The smaller streets are filthy and vile-smelling, but since the post-Boxer military occupation many improvements have been inaugurated by the reforming and progressive prince in whose charge the streets have been placed. The sewers have been thoroughly cleaned out, and the practice of sprinkling the dusty roads with the foul liquid from the gutters has been suppressed. Macadamizing is everywhere in progress. There has been a mint in Peking since 1896, and electrical works since 1900.

The government of the capital of China is very similar to that of Washington, D. C., consisting of an officer and assistants who are responsible to the central authority and not to the Governor of Chili Province. This government district in which Peking is situated is known as Shuntien, and the city of Peking is also known as Shuntienfu.

The population of Peking has been estimated at from 1,400,000 to 2,000,000, but this is probably excessive. A census undertaken by the Minister of the Interior in 1912 estimated the population at 692,500.

Environs. Without the city are many points of great interest. On the east side is the Temple of the Sun, and on the west the Temple of the Moon, where the Emperor invariably worshiped at the summer solstice. On the north, outside the Anting Gate, is the Altar of Earth, where the Emperor formerly worshiped at the vernal equinox. To the northwest are the tombs of the Ming emperors (except two, who were buried at Nanking), approached through a long avenue of colossal lions, unicorns, camels, elephants, and horses, in marble, two pairs of each. Nine miles northwest is the celebrated Yuen-Ming Yuen, or Summer Palace.

History. From the earliest times there has been a city on or near this spot. In 937 the Khitan Tatars, who had conquered north China, made it one of their capitals and called it Nanking, or Southern Capital, the northern being in Tatar. In 1151 the Kin Tatars called it Chung-tu, or Middle Capital. In 1215 the city was captured by Genghis Khan, and in 1264 Kublai Khan made his capital here and built

the present Tatar city, called Ta-tu, or Great Capital, in Chinese, and called Khan-baligh, or City of the Khan, in Mongol, the Kambalu of Marco Polo. The third Emperor of the Ming dynasty settled here in 1409, caused 1½ miles of its length to be cut off, and built the present north wall. The ruins of this discarded section can still be traced. The Manchus in 1643 accepted the city as they found it, but have improved it much. In 1860 it was spared by the Anglo-French expedition, who had no quarrel with the people, although Lord Elgin ordered the Summer Palace to be burned, as an object lesson to the Chinese government. By agreement, however, they held the Anting Gate during the negotiations. On Aug. 14, 1900, its walls were breached and entered by the allied forces sent to relieve the foreigners besieged in the British Legation, and the city was held by the troops until September, 1901. In 1884 Peking was brought into telegraphic communication with the rest of the world. In 1897 it was connected by rail with Tientsin, the terminus remaining outside the south gate until the military occupation made it necessary to carry it into the city. The station is now opposite the Altar of Heaven.

PEKING DUCK. A domestic duck introduced from China about 1870, which has become widely extended and popular, both for the table and as a producer of excellent eggs. In color it is white or cream white, with deep yellow bill,

WHITE PEKING DUCK.

lead-blue eyes, and orange feet. The body is long and deep, the size large, some birds weighing as much as 20 pounds to the pair, and the breed is hardy, easily raised, and profitable. See Duck.

PÉLADAN, pa'lá'dán', JOSEPHIN, called **LE SAR** (1859-). A French mystic, novelist, and art critic, born in Lyons. He became known as a disciple of Barbey d'Aurevilly, posed as a descendant of the last kings of Babylonia, assuming the title Sar (chief) and a theatrical costume, and attracted increasing attention by a series of novels under the general title of *La décadence latine*, which include *Le vice suprême* (1886), *Curieuse* (1886), *L'Initiation sentimentale* (1887), *A cœur perdu* (1888), *Istar* (1888), *La victoire du mari* (1889), *Cœur en peine* (1890), *L'Androgyne* (1890), and *Le gynandre* (1891). These works are an extraordinary mixture of originality and merely riotous imagination, in which human passions, astrological dreams, esoteric doctrines, and astral adventures vie with one another for precedence and the subtlest sensuality does not come off a loser. Entirely distinct from this cycle is the novel *Femmes honnêtes* (1885). Later works are *La vertu suprême* (1901); *Pereat* (1902); *Périgrine et Pérégrin* (1904); *Origine et esthétique de la tragédie* (1903); *Sémiramis* (1904), a tragedy; *La rondache* (1906); *Le nimbe noir* (1907); *La science de l'amour* (1911); *La thériaque* (1912); *Les amants de Pise* (1912); *St. François d'Assises* (1913). As art critic he published *Rembrandt* (1881); *Une introduction à l'histoire des peintres de toutes les écoles* (1884); *La décadence esthétique* (1888); *Le théâtre complet de Wagner* (1894); *Les idées et les formes* (1907); *Les idées et les formes dans l'antiquité orientale* (1908); *Les manuscrits de Léonard de Vinci* (1910); *L'Art idéaliste et mystique* (1911); *Frans Hals* (1912). He founded the order of La Rose Croix, Croix du Temple, in 1892. In spite of many absurdities it seems to have been a reaction against much that was purely material in French art, a reaction that had its equivalent in the Pre-Raphaelite movement in England several years earlier. The Rosierucians held Salons, called the "Æsthetic Geste," and gave concerts, lectures, and plays written by the Sar Péladan.

PELAGIANISM. A fifth-century Western heresy, which originated with the monk Pelagius (q.v.). He took his starting point from the idea that guilt belongs only to the free action of the will, therefore man is not guilty of Adam's sin (see **ORIGINAL SIN**), nor is his will corrupted. Man chooses by his own power, but God's grace comes in to assist those who choose the right. Augustine, on the contrary, held that man's will was wholly corrupted, and we could choose the right only by the power of the grace of God.

Pelagius spent some time in Rome in high repute before raising the issue which was so deeply to agitate the Western church. About the year 405 he openly objected to a prayer contained in Augustine's *Confessions*, "Give what thou commandest and command what thou wilt," on the ground that it tended to destroy all sense of responsibility. He was soon joined by an able ally, Cœlestius, who had been trained as an advocate, and whose subsequent history is bound up with the Pelagian cause. Fleeing before the Gothic invasion (410), the two friends made their way to Africa, where Augustine was then engaged in his controversy with the Donatists (q.v.). Here Pelagius taught that infant baptism was administered not to remove the stain of sin, because infants had none, but rather to sanctify and admit them to the kingdom of

heaven. This was not Augustine's view at all, and as soon as the Donatist dispute permitted he turned to deal with the new foe. By that time, however, Pelagius had left Africa for Palestine, but Cœlestius remained and was seeking ordination as a presbyter. Objection was raised by one Paulinus, a deacon from Milan, who charged Cœlestius with error. He was examined before a synod (412) and condemned for teaching that Adam would have died even if he had not sinned; that Adam's transgression injured only himself; that infants are born into the state in which Adam was before the fall; that unbaptized infants, dying in infancy, have eternal life; that men may attain heaven through a righteous life (keeping the law) as well as through the gospel; that some men have lived without sin, and others may; and that men can easily live without sin if they will. In opposition to these views Augustine maintained that Adam's sin affected the race, involving all mankind in guilt; that physical death is the penalty of sin; that infants are baptized for the remission of original (inherited) sin; and that the only sinless man in the world was Jesus Christ. Most of these ideas are found in his earliest anti-Pelagian work, *The Deserts of Sins and their Remission* (written in 412).

The arrival of Pelagius in Palestine opened the first chapter in the Eastern history of the controversy. Not a few Origenists sympathized with his views, which were in accord with tendencies in earlier Greek thought, and none of them openly opposed him. But Jerome (q.v.), and a little later the Spanish presbyter Orosius, promptly opened the attack. A synod was summoned by John, Bishop of Jerusalem, to consider the question (415), and to it Orosius reported the action of the African clergy in the case of Cœlestius. During the examination of Pelagius his Latin and the synod's Greek seem to have occasioned some misunderstanding, but he finally consented to anathematize any one who taught "that man can ever become perfect without God's aid," and this so far satisfied the synod that it dissolved without condemning him. Orosius, however, and some others, felt that the Bishop had not been impartial in his conduct of the inquiry. At the more important Synod of Diospolis, presided over by Eulogius of Cæsarea (415), Pelagius either disavowed or explained away the heretical opinions with which he was charged and was thereupon pronounced orthodox—a result which angered Jerome and caused Augustine afterward to declare that Pelagius had deceived his judges. Pelagius now proceeded to issue his treatise *On Free Will*, which was presently supported by Theodore of Mopsuestia, who attacked Jerome's idea that "men sin by nature, not by will."

Upon Orosius' return to Carthage a synod was held (416), reaffirming the adverse judgment of the African church and appealing to Innocent, Bishop of Rome, to aid in opposing Pelagianism with "the authority of the apostolic see." A similar appeal was made by the Synod of Mileve in Numidia. Innocent replied as they had hoped he would, saying that Pelagians must be excluded from the Church. Two months later he was succeeded by Zosimus, a Greek, who proved more friendly to the Pelagians than his predecessor. To him Cœlestius appealed in person, and after examination, in which he denied the heretical opinions charged against him and made a formal profession of faith, the Pope re-

fused to condemn him, although he cautioned him to abstain from pursuing further his unprofitable speculations. Soon after this Zosimus received from Pelagius a written statement of belief, similar to that of Cœlestius, on the strength of which he too escaped condemnation. The African clergy were greatly disturbed at the Pope's action, reversing as it did the policy of Innocent, but they were not to be turned from their position. Another large synod reaffirmed once more the condemnation of Pelagianism and urged upon Zosimus a reconsideration of the whole case. Their action, coupled with the fact that at this juncture the Emperor Honorius issued a strong anti-Pelagian decree, aroused the Pope to action. He reversed his judgment and now wrote a circular letter to the bishops, calling upon them to assent to the condemnation of Pelagius and Cœlestius and setting forth in Augustinian terms the doctrine of sin and grace. This document is known as the *Epistola Tractoria*, and its date is 418. What may be regarded as the final collective action in the West was taken by a great national synod held the same year in Carthage, whose decrees anathematize Pelagianism in clear and unmistakable terms. Soon afterward Augustine wrote his two works, *On the Grace of Christ* and *On Original Sin*, in which he argues that all man's righteousness comes from God, who is the ultimate principle of goodness, back of every impulse of the human heart. Here one may find the uncompromising doctrine of the necessity of divine grace which is characteristic of Augustinianism. And here, too, is that last resort to which Augustine more than once was driven by the logic of his opponents, the inscrutability of God's dealings with His creatures, expressed in the words of St. Paul, "O the depth of the riches, both of the wisdom and the knowledge of God!" (Rom. xi. 33). Augustine had indeed reached the boundaries of knowledge.

But Augustinianism was not yet victorious. Eighteen Italian bishops refused their assent to the *Tractoria* of Zosimus, among them Julian of Eclanum, one of the best debaters on the Pelagian side. These bishops were promptly excommunicated, but Julian headed a schism which lasted for several years and gave the Church no little trouble. The Pelagians took refuge in the East, where, among others, the patriarch Nestorius showed them favor. But their partial alliance with him proved disastrous in the end, for at the Third Ecumenical Council (Ephesus, 431) both Nestorius and Pelagius were condemned. This result was largely due to the untiring efforts of Marius Mercator, a layman from the West, to whom we owe much of our information on the subject. Pelagian views did not at once disappear, either in the East or in the West, even penetrating to Britain and Ireland; for their subsequent history, see SEMI-PELAGIANISM.

Fathers, 1st series, vol. v, ed. by Philip Schaff, ib., 1908); also Wace and Piercy (eds.), *Dictionary of Christian Biography and Literature* (Boston, 1911).

PELAGIC (pê-lāj'ik) **ANIMALS** (from Gk. πελαγικός, *pelagikos*, relating to the open sea, from πέλαγος, *pelagos*, open sea). The pelagic or surface fauna of the ocean comprises an assemblage of animals which live on the high seas, far from land. They live permanently at or near the surface of the ocean, in the warmer parts of the earth. Among them are many Foraminifera, of which *Globigerina* is the most abundant, also the Radiolaria (q.v.), Siphonophora (q.v.), many Medusæ (see MEDUSA), all the Ctenophora, many entomostracous Crustacea, certain schizopod Crustacea, as *Mysis*, pteropod and heteropod mollusks, the nudibranch *Glausus*, the Salpæ (see SALPA), and most cephalopods, as the squid and calamary; while the flying fish, certain little fishes (Antennariidæ) nesting in gulf weed, many sharks, and the whales and porpoises make up the assemblage.

The pelagic invertebrate animals, such as the Medusæ, Salpæ, etc., are very transparent, either colorless or with blue or violet tints. The pelagic fishes are usually gray or steel blue above, white beneath, not being so strikingly marked as those frequenting the shore or coral reefs. See DEEP-SEA EXPLORATION; LANTERN FISH; OOZE; PLANKTON.

PELAGIC SEALING. See ALASKA, *Furs*.

PELAGIUS, pê-lă'jī-ŭs. A British monk, author of the Pelagian heresy, who flourished during the first quarter of the fifth century. The dates of his birth and death are unknown; his life from about 400 to 418 is better known. A late and uncertain tradition says that his name was Morgan (*Marigena*, sea-born), of which Pelagius (Πελάγιος) would be the Greek translation. Augustine calls him a "holy man, who has made no small progress in the Christian life." The known history of his life begins with his visit to Rome, whither he went probably in the year 401; thenceforth it is that of the Pelagian controversy, for which see PELAGIANISM. He left Rome in 411 and went to north Africa and thence to Palestine. Nothing is known with certainty of the close of Pelagius' life, but one tradition says that he died in Palestine at the age of about 70 years. Among his writings we have the creed which he submitted to Bishop Zosimus, a letter to Demetrius about the ascetic life, and some fragments. He wrote a work *On the Trinity*, another *On Free Will*, a *Commentary on Paul's Epistles*, probably extant in a revised form among the works of Jerome, and the *Eulogia*, a collection of extracts from the Scriptures, for use as an aid to Christian living. Consult: G. P. Fisher, *History of Christian Doctrine* (New York, 1896); W. Bright, *The Age of the Fathers*, vol. ii (London, 1903); Augustine, *Anti-Pelagian Works* (Eng. trans. in *The Nicene Fathers*, 1st series, vol. v, ed. by Philip Schaff, New York, 1908); Wace and Piercy (eds.), *Dictionary of Christian Biography and Literature* (Boston, 1911); and the literature under PELAGIANISM.

PELAGIUS. The name of two popes.—PELAGIUS I (Pope, 555-60). He came of a noble Roman family and as a deacon accompanied Pope Agapetus I to Constantinople (536). Pope Vigilius appointed him his representative at the Imperial court there in 540, and he won great

influence over the Emperor Justinian. He took a vigorous part in the controversy over the Three Chapters of Justinian (see CHAPTERS, THE THREE), in which the decree of the Council of Chalcedon on the Person of Christ was constructively condemned. Despite his opposition to the Emperor's views, the latter, on the death of Vigilius, put him forward as his candidate for the vacant see. He was ill received on his return to Italy as the Imperial nominee, and only two bishops came to assist in his consecration. He endeavored to clear himself from the charge of complicity in heresy by a solemn protestation of allegiance to the teaching of the four general councils, and especially that of Chalcedon; but he could not prevent a schism in northern Italy. He died in Rome, March 3, 560, or, according to Duchesne, March 4, 561. His letters are in Migne, *Patrologia Latina*, lxi; some additional ones in Lowenfeld, *Epistolar Pontificum Romanorum Ineditæ* (Leipzig, 1885). —PELAGIUS II (Pope, 578–90), born in Rome of a Catholic family. He was elected Pope when Rome was besieged by the Lombards, and appealed to the Greek Emperor Tiberius II for assistance, but that monarch was too much occupied with a war in Persia. He then turned to the Franks, with whom Maurice, the successor of Tiberius, concluded a treaty. The Franks, however, proved untrustworthy allies, and the troubles of Italy continued. He took great offense at the toleration of the title "universal bishop" by John the Faster, Patriarch of Constantinople, and forbade his representative there to attend any service celebrated by John. But his heart was gladdened at the end of his pontificate by the news that the West Goths in Spain had returned from Arianism to the orthodox faith (589). He died of the plague in Rome, Feb. 7, 590. His letters are in Migne, *Patrologia Latina*, lxxii. He was succeeded by Gregory the Great, who had long been his trusted counselor and in whose biographies many of the events of his pontificate will be found; consult also Weise, *Italien und die Langobardenherrscher* (Halle, 1887), and Mann, *Lives of the Popes*, vol. i (London, 1902).

PELAGOSAURUS (Neo-Lat., from Gk. *πέλαγος*, *pelagos*, open sea + *σαῦρος*, *sauros*, lizard). An extinct Liassic crocodile, found fossil in southern Germany, in France, and in England, having a peculiarly elongated narrow skull and jaws furnished with many sharp, slender teeth. See CROCODILE.

PELARGONIC ACID, $C_6H_{10}O_2$. One of the so-called fatty acids. It is an oily liquid, nearly insoluble in water, but soluble in alcohol and ether. It derives its name from its having been originally obtained from the leaves of *Pelargonium roseum* by distilling them with water. It may also be obtained by the oxidation of oil of rue with nitric acid. It is supposed to exist in a combined form in old whisky.

PELARGONIUM (Neo-Lat., from Gk. *πελαργός*, *pelargos*, stock; so called from the resemblance of the capsules to a stork's bill). A genus of plants of the family Geraniaceæ, including many favorite greenhouse and house plants, which are generally called geraniums (q.v.). The genus contains about 200 species, smooth or downy perennial herbs or undershrubs, native chiefly of South Africa, a few species being found in the Mediterranean region and in Australia. The species in cultivation have become so modified that it is often difficult

to determine their origin. The leaves exhibit great variety in form, texture, fragrance, and color. The flowers always adhere to a certain type in form, but vary greatly in color and size; they are always in stalked umbels, arising from

A CULTIVATED VARIETY OF PELARGONIUM.

the axils of the leaves, or in the stemless kinds from the midst of the leaves. In no genus has the art of the gardener produced more striking results than in this; and the number of beautiful hybrids and varieties is very great, some of them excelling in beauty any of the original species. Some species, not possessing much beauty of flower, are cultivated for the grateful odor of their leaves. Geranium oil, used as a substitute for attar of roses, is distilled from *Pelargonium odoratissimum* in Algeria and from *Pelargonium roseum* and other species in Cape of Good Hope. The cultivated species are divided into four groups, viz., ivy geraniums, derived from *Pelargonium peltatum*; scarlet, horseshoe, or zonal geraniums, from *Pelargonium zonale* and *P. inquinans*; Lady Washington geraniums; and rose geraniums. The horseshoe geraniums often have a horseshoe-shaped dark zone on the leaf. The flowers of the Lady Washington varieties are very large and irregular, while the rose-colored or purple flowers of the rose geraniums are rather small. These last two groups each include a number of different species. Most of the common varieties are largely grown as bed and border plants, their outdoor culture being quite simple. For this purpose the plants are taken from the greenhouse after danger of frost has passed and set out in a well-worked, rich, sandy loam. Water must be liberally supplied during the time of flowering; but for no plants is a period of rest more necessary, and water must then be very sparingly given. Many of the half-shrubby kinds may be trimmed of leaves and watery shoots, hung up by the roots in a dry cellar, or covered with hay in a box, in a cool but frost-proof dry loft or garret. Another method is to cut off every leaf before frost comes and to keep the plants all winter in their pots in a dry, cool room, without watering them. By such means many varieties are successfully cultivated by persons who have no greenhouse. Pelargoniums are commonly propagated by cuttings from the firm shoots, which root readily.

PELASGIAN (pē-lās'jī-an) **ARCHITECTURE**. See CYCLOPEAN ARCHITECTURE; PELASGIANS.

PELASGIANS (Lat. *Pelasgi*, from Gk. *Πελαγιοί*, *Pelagioi*, of uncertain etymology). The name of a people dwelling in Greece in early

times, used with very different meanings at different periods. In the Homeric poems the Pelasgians seem to be the inhabitants of Pelasgian Argos in southern Thessaly, about Mount Othrys, and of the fertile valley of the Peneus around Larissa in Thessaly, and the Zeus of Dodona is also called Pelasgian. In a somewhat late part of the *Iliad* they appear among the allies of the Trojans, thereby causing much trouble to ancient and modern commentators. As there is no other trace of their existence in Asia Minor, very possibly the poet, knowing of enmity between the Achæans of Phthiotis and their northern neighbors, thought of the latter as coming from Thessaly to Troy. In the *Odyssey*, xvii, 175-177, they are mentioned as one of the tribes in Crete. Nothing in the epic indicates that they are of other race than the Greeks. Like the other tribes of Thessaly they seem to have been conquered by the Thessalians, and probably largely reduced to the position of *penestæ*, or serfs, though their old territory was known in historical times as Pelasgiotis. Tradition, however, told of the former state of their King, Pelasgus, son of the earth. This seems the slender basis on which the extensive and contradictory legend of the Pelasgians grew up. In Hesiod we find Pelasgus transferred to Arcadia, whose people also claimed to be autochthones, though it must be said that Pelasgians do not appear as a race in any early Arcadian legend. The epithet Pelasgian was transferred to Argos in Peloponnesus, and we find there also a King Pelasgus prepared to receive Danaus and his daughters. Herodotus decided that the old name of Greece was Pelasgia, and that the Pelasgians preceded the Hellenes (naturally, since Hellenes could not well exist before Hellen and his three sons), while many Greek genealogies traced descent from different sources. Further confusion was invited by the transformation of the Athenian name for the old fortification of the Acropolis, Pelargicon, into Pelasgicon; whence it followed that Pelasgians had lived in Attica. Moreover, Hecateus, who seems to have made this transformation, also identified the Tyrrhenians of Lemnos with Pelasgians and brought them from Attica to the island. As the Etruscans were also Tyrrhenians, it followed that they were Pelasgians, and so the race appeared in Italy. This identification also converted Pelasgians into barbarians, for every one knew that the Tyrrhenians were not Greek. Thus towards the end of the fifth century B.C., apparently by Hecateus, the legend was fully developed that they were the original inhabitants of Greece, driven from Peloponnesus to Thessaly by the Danaans and scattered to the four winds by the Hellenes. It has been well said that in general the Pelasgians only appear in a land in order to be driven out. From this conception of the Pelasgians naturally arose the theory that to them were due the great works of the early days, and the mighty walls that some called Cyclopean were by others termed Pelasgian. In recent years it has become very common to employ the term Pelasgian to designate the pre-Aryan population of Greece and Italy, to whom is attributed the pre-Mycenæan civilization; not, of course, with the implication that this population formed one great people, but rather as a convenient collective name for more or less closely related tribes. This use may be criticized as easily leading to the belief that it rests

on ancient authority and not on modern speculation. Of late the Pelasgians have been brought into special prominence by the theory that to them is due the entire Mycenæan civilization; that they were invaded and conquered by the Achæans, a fair-haired tribe akin to the Celts, who became a ruling class and to whom is due the Homeric civilization. The dark-haired Pelasgians, it is held, gradually absorbed their conquerors, as has been the case in other invasions of these lands by blond northern races. The theory uses largely, if uncritically, the ancient authorities, but has not won general acceptance.

The literature on this question is very voluminous. The more important discussions, to 1889, are collected in Hermann, *Lehrbuch der griechischen Antiquitäten* (6th ed. by Thumser, Freiburg, 1889). Consult also Busolt, *Griechische Geschichte*, vol. i (2d ed., Gotha, 1893). For the ancient statements, consult S. Bruck, *Quæ Vetres de Pelasgis Tradiderint* (Breslau, 1884), and especially the thorough examination by E. Meyer in his *Forschungen zur alten Geschichte*, vol. i (Halle, 1892), who has shown how largely they consist of guesses. The new theory is presented in W. Ridgeway, *Early Age of Greece* (Cambridge, 1901 et seq.). It is discussed in H. R. Hall, *Oldest Civilization of Greece* (Philadelphia, 1901), and by J. L. Myers in *Classical Review*, vol. xvi, in a review of Ridgeway's book (London, 1902). Consult also J. L. Myers, "A History of the Pelasgian Theory," in *Journal of Hellenic Studies*, vol. xvii (ib., 1907), and R. Pöhlmann, *Grundriss der griechischen Geschichte* (4th ed., Munich, 1914). See MEDITERRANEAN RACE.

PELAYO, pá-lá'yô (died 737). The first Christian King in Asturias after the conquest of Spain by the Arabs. Little is known about his life. He was, strictly speaking, nothing but a robber chieftain; still by his defense of Covadonga, a mountain fastness, in 718 against the Moslems, he kindled the national spirit and laid the foundation for the Christian recovery of Spain. A legend states that at Covadonga he and 30 followers destroyed an Arab army 400,000 strong. Consult U. R. Burke, *A History of Spain*, vol. i (London, 1895).

PELECYPODA (Neo-Lat. nom. pl., from *πέλεκυς*, *pelekys*, axe + *πούς*, *pous*, foot), or **LAMELLIBRANCHIATA**, or **BIVALVES**. A class of bilaterally symmetrical acephalous mollusks, all of which have bivalve shells and gills in the form of vascular plates of membrane attached to the inner surface of the mantle. The body is very strongly compressed, the dorsoventral diameter being much greater than the lateral. The adductor muscle, which closes the shell, is single in some, double in the greater number. The shell is naturally more or less open, owing to the peculiar elastic hinge which tends to keep it open; but the adductor muscles continually tend to close it. Consequently when a live mollusk is irritated the shell closes tight, but when the animal is dead the muscles relax and the shell gapes open. Important differences exist in the powers of locomotion. Oysters are fixed to one spot by one of the valves of the shell; but most of the pelecypods have the power of moving by swimming, leaping, or burrowing in sand, sometimes in more than one of these ways, being provided for this purpose with a fleshy muscular organ called the foot. Some, as mussels, fix themselves when young by a cable of chitinous threads, the byssus. The mouth is

jawless and toothless, but on each side are two flaps, the labial palpi. All seem to depend for their food on the currents of water continually brought by ciliary action into the mouth. The edges of the mantles are sometimes entirely separate from each other, but are often more or less fused. In the latter case two openings are left in the posterior edge, through the lower of which water is brought into the mantle cavity, whence, having been deprived of its oxygen by flowing over the gills, and of its nutritive material in the stomach, it passes out through the upper opening, carrying away the waste and, at the proper season, the reproductive elements. Various modifications of this inhalant and exhalant apparatus exist, and in many forms the orifices become elongated into two tubes called siphons, which, as in the clam, may often be extended several inches beyond the shell. Bivalves with such siphons live buried in mud or sand with only their siphons reaching the surface. The edges of the mantle often bear tentacles, papillæ, glands, and more or less complicated eyes. The two halves of the shell are usually of about the same size, but in some forms one valve is very much larger than the other. Generally the shell covers the whole animal, and when the shell is closed the animal is completely shut in, but in the shipworm (q.v.) the two halves of the shell are very small and inclose only an insignificant part of the greatly elongated body.

The ear, or otocyst, is situated in the foot. The heart is three-chambered, there being two auricles and one ventricle. The sexes exist in different individuals. The number of eggs is usually enormous, the oyster producing about 2,000,000 each season. The young pelecypod passes through a free-swimming veliger stage, and some bivalves get their growth in a single year. The freshwater mussels live from 10 to 12 years, while the giant clam (*Tridacna*) is supposed to attain an age of from 60 to 100 years. Many bivalves are of great use to man as food, notably oysters, clams, and scallops. Others, as the shipworm (q.v.), are injurious. The mollusks of this class vary in size from a small fraction of an inch up to the giant clam (q.v.) of the East Indies, which reaches 3 feet in length. In many species the shells are very beautiful, the interior being lined with nacre, or mother-of-pearl. Pearls (see PEARL) are formed in many, especially in the pearl oyster and freshwater mussels. Bivalves inhabit all parts of the world in both salt and fresh water, and form a highly important part of the food of many valuable fishes, especially those of the cod family, as well as of other marine animals. About 14,000 species are known, 8000 or 9000 of which are fossils; and they are generally grouped in five orders, distinguished by the character of the gills.

See MOLLUSCA; MOLLUSK and authorities cited thereunder; OYSTER; Colored Plate of CLAMS AND EDIBLE MUSSELS and Plate of ABALONE, ETC.

PELÉE, MONT, mōn pe-lâ' (or more properly, MONTAGNE PELÉE). A volcano of the island of Martinique, in its northwestern part, in about lat. 14° 48' N. (Map: West Indies, G 4). The elevation of the Morne de la Croix (the culminating point at the time) before the eruption of May, 1902, was about 4300 feet; of the newly formed cone, with its extended plug or obelisk, in May, 1903, 5200 feet. The mountain has ex-

tremely gradual slopes, which rise with gradients of from 5 to 25 degrees, and is constructed of alternating lava masses (andesite) and fragmental agglomerates. Its surface is scarred by deep ravines and waterways, the latter numbering about 25, the majority of the streams taking individual courses to the sea. Prior to 1902 the only recorded eruptions occurred in 1762 and 1851, neither of which was very violent. All of the outbreaks have been from craterlets situated on the western and southwestern slopes of the mountain. The disastrous eruptions of 1902 were from the basin of the Etang Sec, or Dry Lake, the true crater, about ½ mile in greatest diameter, surrounded in greater part by rugged walls of rock 1600 feet or more in height. The seaward face of the Morne de la Croix plunged at an angle of 75° into this crater basin. The active opening of this crater was on April 25, 1902; from it, on May 5, descended an avalanche of boiling black mud that destroyed the sugar estate (*usine*) of Guérin and buried beneath its mass 30 or more of the workmen and proprietors. Then followed the great explosion of May 8, when a black cloud of explosive and exploded superheated steam, charged with glowing incandescent particles, destroyed St. Pierre and with it hardly less than 30,000 people. The phenomena of this remarkable eruption have not been presented in detail, but they were extraordinary for the intensity of the associated electric manifestations, the vast disturbance in the magnetic field, and the violence of the destroying blow. The magnetic disturbance was transmitted to the antipodal region of the earth in about two minutes' time, while the noise of the eruption manifested itself forcibly at Maracaibo, Venezuela, and beyond, at a direct distance of 850 miles, or considerably more.

The second death-dealing eruption of Mont Pelée took place on Aug. 30, 1902, and destroyed in less or greater part Morne Rouge and Ajoupa-Bouillon, besides inflicting considerable damage, with loss of life, upon Morne Balai, Morne Capot, and Bourdon (Basse-Pointe). The loss of life was estimated at from 2000 to 2500. For some time after that date the volcano was continuously active, discharging vast quantities of lapilli and ashes. The column of ejected steam, laden with dust and lava bombs, shot forth from the crater on August 30, just before the second great eruption, was estimated to have a diameter of 1500 feet as it rose over the crest of the crater, and its initial velocity was roughly computed to be in the neighborhood of 100 miles an hour. The steam ascended miles into the air, spreading out into a broad, mushroom-like canopy. The most extraordinary feature associated with the later activity of Pelée was the giant mass of rock, a veritable obelisk, which was slowly pushed out through the summit opening of the new cone and rose to upward of 800 feet, with a basal thickness of 300-350 feet. This afterward disappeared.

Despite the accentuated warnings which for a period of two weeks and more Mont Pelée threw out presaging disaster, only a few hundred of the inhabitants of St. Pierre took the precaution to leave the city; and this loss to the population was counterbalanced by numbers of refugees who from minor villages and hamlets had flocked to the larger city for protection. The annihilating blow came with appalling swiftness, and there is reason to believe that for the greater part of the 30,000 victims death

was well-nigh instantaneous or, at least, brought about in two to three minutes. Only two of the inhabitants from the city proper appear to have survived their wounds, although a dozen or more lingered on in the hospital of Fort-de-France and elsewhere for a few days. The attitudes and conditions of many of the corpses found among the ruins were largely suggestive of the remains (casts) recovered from Pompeii, and there is reason to believe that the destruction of the two cities may have been brought about in very nearly the same way. In both places many of the bodies were found wholly destitute of clothing or giving indication of having had the clothing swept from the body by a tornadic blast. For several days preceding the cataclysm St. Pierre was well covered with ash, lending a wintry aspect to the city. See MARTINIQUE.

PELEE (pé'lé) ISLAND. An island in the western waters of Lake Erie, belonging to Essex County, Ontario, Canada, about 6 miles northward of the Put-in-Bay group and 10 miles southwest of Point Pelee on the Essex County mainland (Map: Michigan, G 7). It is 9 miles long and 4 miles wide at its widest part. Marshlands cover a part of the area and some timber is found. The land is being rapidly occupied by vineyards, and grapes are becoming a considerable product.

PELETHITES. See CHERETHITES AND PELETHITES.

PELEUS (Lat., from Gk. Πηλεΐς). In Greek legend, a son of Æacus, King of Ægina, and the nymph Endeïs, and a brother of Telamon. In jealousy he and Telamon brought about the death of their half brother Phocus and were banished. He withdrew to Phthia in southern Thessaly, where Eurytus purified him from bloodguiltiness and gave him his daughter Antigone to wife. While participating in the Calydonian Hunt he had the misfortune to kill his father-in-law accidentally. Once more an exile, he withdrew to Iolcos, where Acastus, son of Pelias, was celebrating magnificent funeral games for his father. In these Peleus took part, but was defeated by Atalanta in wrestling. Here he attracted the notice of Astydameia, wife of Acastus (or, in another version, Hippolyte, daughter of Cretheus), who offered him her love. On his refusal she slandered him to his wife and Acastus. Antigone hanged herself, while Acastus planned the death of Peleus.

Rescued by Chiron, the good centaur, Peleus later returned with Jason and the Dioscuri, destroyed the city, and killed Acastus and his wife. Celebrated in legend was his marriage to the Nereid Thetis, who had been sought by Zeus and Poseidon, but was given to a mortal because of the prophecy that her son would be mightier than his father. Peleus, helped by the gods, lay in wait for her by the shore, and in spite of her transformations into fire, water, and wild beasts, held her fast until she returned to her original form. The marriage was attended by all the gods, who bestowed valuable gifts. Poseidon gave him two immortal horses, and Chiron the ashen spear which Achilles wielded at Troy. Into this gathering Æte threw the golden apple inscribed "For the Fairest," which led to the Judgment of Paris and the Trojan War. (See PARIS.) By Thetis Peleus became the father of Achilles (q.v.), and in later writers she is said to have returned shortly to her life as a Nereid, while the boy was brought up by Chiron; but this tale seems unknown to the Homeric poems, though even in the *Iliad* Thetis is represented as dwelling in the sea. Peleus is also said to have been one of the Argonauts (q.v.) and to have accompanied Hercules and Telamon to Troy. The marriage of Peleus and Thetis was described by later poets (consult, e.g., Catullus, lxiv), and was represented on works of art, of which the best known is the celebrated François vase in Florence, made by the Athenians Clitias and Ergotimos in the sixth century B.C.

PELEW (pé-léw) ISLANDS. A group of islands in the Pacific Ocean. See PALAU ISLANDS.

PELHAM, HENRY. See NEWCASTLE, FIFTH DUKE OF.

PELHAM, pé'l'am, HENRY FRANCIS (1846-1907). An English educator. He was educated at Harrow and at Oxford, where in 1869 he was elected a fellow of Exeter College. At Exeter he was afterward tutor for 21 years. In 1887 he became university reader in ancient history, in 1889 succeeded Canon Rawlinson as Camden professor of that subject, and from 1897 until his death was president of Trinity College (Oxford). His publications include: *Outlines of Roman History* (1890); *The Imperial Domains and the Colonate* (1890); *The Roman Frontier System* (1895); *Essays* (1911).

PELHAM, PETER (1684 or 1694-1751). An English mezzotint engraver, born probably at Chichester. After engraving about 20 portraits, including Queen Anne, after Kneller, and Oliver Cromwell, after Walker, he emigrated in 1726 to America and settled in Boston. Here he opened a school in which he taught painting, reading, writing, dancing, and needlework, also keeping up his engraving. His mezzotint portrait of Cotton Mather (1727) was the first of its kind ever produced in America. He engraved 13 other plates, principally heads of divines, which show considerable merit. Some are after his original paintings. Pelham was the stepfather and first master of John Singleton Copley (q.v.).

PELHAM-HOLLES, hólz, THOMAS, first DUKE OF NEWCASTLE. See NEWCASTLE, THOMAS PELHAM-HOLLES, first DUKE OF.

PELHAM, OR THE ADVENTURES OF A GENTLEMAN. A novel by Bulwer-Lytton (1828).

PELIAS (Lat., from Gk. Πηλεΐας). In Greek legend, a son of Poseidon and of Tyro, daughter

of Salmoneus, and twin brother of Neleus, father of Nestor. With his brother he was exposed by Tyro, but the children were found and reared by a herdsman, who named him Pelias (cf. *πέλος*, *pelos*, dark-colored) because his face was livid from a kick by a mare. In the meantime Tyro had become the wife of Cretheus, King of Iolcos in Thessaly, and mother of Aeson, Pheres, and Amythaon. The twins later found their mother, and after Cretheus's death Pelias succeeded in seizing the throne from Aeson, who fled into exile. By his wife, Anaxibia, daughter of Bias, he became father of Acastus and four daughters. One of these was Alcestis, who was won by Admetus, who met the test imposed by her father by harnessing a lion and a boar to a chariot. Jealous of Jason, his nephew, Pelias dispatched him to secure the Golden Fleece at Colchis. (See ARGONAUTS.) On the return of the *Argo* Medea persuaded the daughters of Pelias that she could rejuvenate their father by boiling his flesh with magic herbs. They accordingly killed and cut up the old man, but were then mocked by Medea, who thus revenged the wrongs of her husband, Jason. Pelias' funeral was celebrated with great splendor by Acastus, and the games were a favorite theme with ancient poets. See MEDEA.

PELICAN (AS. *pellican*, from Lat. *pelicanus*, *pelicanus*, from Gk. *πελεκάν*, *pelekan*, pelican, connected with *πελεκᾶς*, *pelekas*, woodpecker, and *πέλεκυς*, *pelekys*, axe). A large web-footed, fish-eating water bird of the family Pelecanidae and the genus *Pelecanus*, having a very large, long, flattened bill. The upper mandible, which is terminated by a strong hook, curves over the tip of the lower one, and beneath the lower mandible, which is composed of two flexible bony branches meeting at the tip, a large distensible pouch of naked skin is appended. The tongue is very short and almost rudimentary, the face and throat generally are naked, the wings of moderate length, the tail rounded. About 12 species are known, widely distributed in warm regions, frequenting the shores of the sea, lakes, and rivers, and feeding chiefly on fish. They take their prey by plunging upon it into the water, and store it in their pouch for their own eating at leisure or to feed their young. Three species of pelican occur in the United States. The white pelican (*Pelecanus erythrorhynchos*) was formerly found throughout North America, but is now rare east of the Mississippi, except along the Gulf coast, where it winters. It resembles the common pelican of the Old World, but differs in having a curious horny prominence on the bill during the breeding season. The plumage is pure white, excepting the primaries. It is the largest American species, being 5 feet long and 8 or 9 feet across the wings. It breeds in colonies generally. The eggs, from one to four in number, are creamy or bluish white, $3\frac{1}{2}$ inches long by $2\frac{1}{4}$ broad. The brown pelican (*Pelecanus fuscus*, or *occidentalis*) is somewhat smaller than the white pelican and gray and brown. It is found throughout the West Indies, occurs as far north as South Carolina, and breeds throughout its range. The brown pelican of the California coast (*Pelecanus californicus*) is a trifle larger and shows more difference in color.

The common pelican of the Old World (*Pelecanus onocrotalus*) is as large as a swan. Its

plumage is white, tinged with flesh color. It is a native of eastern Europe and of many parts of Asia and Africa and frequents both the sea-coast and rivers and lakes. It makes a nest of grass on the ground near the water and lays two or three white eggs. The parents are said to carry water to their young, as well as food, in their pouches. The nail or hook which terminates the bill is red, and it has been suggested that the ancient fable of the pelican feeding its young with blood from its own breast originated from its habit of pressing the bill upon the breast, when the red tip might be mistaken for blood.

In heraldry the pelican is drawn with her wings indorsed and wounding her breast with her beak. When represented in her nest feeding her young with her blood she is called a pelican in her piety. This is connected with the fable above mentioned and with the symbolism of the pelican in mediæval religious art as significant of self-sacrifice. Consult Louisa Twining, *Symbols and Emblems of Early and Mediæval Christian Art* (new ed., London, 1885) See Plate of FISHING BIRDS

PELICAN ISLAND. See ALCATRAZ
PELICAN'S-FOOT, or SPOUT SHELL A

FOSSIL APORRHAIIDÆ.

1, *Alaria myurus* (lower Oolite), 2, *Anchura carinata* 3, *Spinigera semicarinata* (Jurassic), 4, *Aporrhais calcarata* (upper Greensand)

shell of a gastropod of the family Aporrhaidæ, of which but four living species remain, but a great number of quaintly-shaped fossil species are known from the Jura onward. The most common specimens are of *Aporrhais pes-pellicani*, numerous on the western European coast. Its widely distended and prolonged outer lips account for its popular name. A heavier, less forked species (*Aporrhais occidentalis*) is occasionally seen off New England. These mollusks inhabit rather deep water, and their habits are little known.

PELICAN STATE. Louisiana. See STATES, POPULAR NAMES OF.

PELION (Lat., from Gk. Πήλιον) A range on the coast of Thessaly, southeast of Ossa (Map: Greece, E 4). The chief summit, now called Plessidi, is 5308 feet high and in ancient times was a seat of the worship of Zeus Acræas. The mountain is still thickly wooded with oak, chestnut, and beech. In ancient legend it played an important part as the home of the centaurs, and especially of the good centaur Chiron, whose cave was shown in later times. Otus and

PELICAN'S-FOOT SHELL.

Ephialtes (see *ALOAE*) in their attempt to scale heaven were said to have piled Ossa on Olympus and Pelion upon Ossa, or, according to Vergil, Ossa on Pelion, and Olympus upon Ossa.

PÉLISSIER, *pá'lé'syá'*, AIMABLE JEAN JACQUES, DUKE OF MALAKOFF (1794-1864). A marshal of France, born at Maromme, near Rouen. He studied at the artillery school of La Flèche and at Saint-Cyr, from which he entered the artillery of the Royal Guard in 1815 as a sublieutenant. He served in Spain in 1823, made the campaign of the Morea in 1828, joined the first expedition to Algiers in 1830, and in 1839 returned to Algeria with the rank of lieutenant colonel. In 1845 he acquired an unenviable notoriety by putting to death by suffocation some 600 Arabs who took refuge in the caves of the Dahra and refused to surrender. By 1850 Péliissier had attained the rank of general of division. When the news of the coup d'état of Dec. 2, 1851, reached Algeria, he espoused the cause of the Emperor and placed the province under martial law until order was restored. In the Crimean War he was given command of the First Army Corps, and early in 1855 he succeeded Marshal Canrobert in the chief command. After the fall of Sebastopol Péliissier received a marshal's baton, and on his return to France was created Duke of Malakoff and a Senator and was granted a large pension. He was also made a member of the Order of the Bath by Queen Victoria. In 1858 he went to London as French Ambassador, but resigned in the following year a post for which he had little relish. He was then named Governor-General of Algeria, and died at Algiers May 22, 1864.

PELL, JOHN (1610-85). An English mathematician, born at Southwick in Sussex. He was educated at Steyning and at Trinity College, Cambridge. He was a remarkable student, having at the age of 20 mastered Hebrew, Greek, Latin, Arabic, Italian, French, Spanish, and Dutch, and having shown much proficiency in mathematics. He was elected to the chair of mathematics at Amsterdam in 1643. By the invitation of the Prince of Orange (1646) he accepted the professorship of mathematics at Breda. He returned to England a few years later (1652) and was made political agent to the Protestant cantons in Switzerland by Cromwell in 1654. Returning again to England in 1658, he entered the ministry (1661) and became rector of Fobbing and vicar of Laindon, both in Essex County, which offices he retained till his death. He was chosen fellow of the Royal Society in 1663 and in the same year became domestic chaplain to Dr. Sheldon, Bishop of Canterbury, and took the degree of doctor of divinity. But his interest in philosophy and mathematics unfitted him for the ministry, leading him to neglect his clerical duties in pursuit of more congenial studies. Pell was influential in the matter of fixing the symbolism of algebra. The division symbol \div is commonly attributed to him, although it was due to Rahn (Rhonius), whose work, translated by Branner, Pell changed, enlarged, and edited under the title *An Introduction to Algebra* (London, 1668). His name is associated with a certain equation, $x^2 - ay^2 = 1$, although he had but little to do with it. For the history and theory of this equation, consult Whitford, *The Pell Equation* (New York, 1912). His

most important mathematical works are: *A Refutation of Longomontanus's Pretended Quadrature of the Circle* (1646; in Latin, 1647); *A Table of 10,000 Square Numbers* (1672); *An Antilogarithmic Table*, computed with the aid of Walter Warner (c.1630-40), now lost; *An Idea of Mathematics* (1650) and a collection of some 40 folio volumes of letters and papers preserved in the British Museum.

PEL/Ā (Lat., from Gk. Πέλλα). An ancient city, situated in the southeastern part of Macedonia, on the river Ludias, which formed around it impassable marshes, the present Lake of Janitza. At the end of the fifth century B.C. it was the capital of King Archelaus. It first grew to a town of importance under Philip II, and became celebrated as the birthplace of Alexander the Great. It was the capital of the Macedonian kings from Antigonos Gonatas to Perseus, and in its acropolis they kept their treasure. By the Romans it was made a colony and seems to have enjoyed some prosperity, but under the later Empire it gradually declined. The name seems to have clung to a spring not far from Janitza, and the ruins of the town are to be found at the neighboring Palatitza, where parts of a large palace have been excavated. Consult Heuzey and Daumet, *Mission archéologique en Macédoine* (Paris, 1876), and Adolf Struck, *Makedonische Fahrten* (2 vols., Sarajevo, 1908).

PELLA. A city in Marion Co., Iowa, 48 miles by rail southeast of Des Moines, on the Chicago, Rock Island, and Pacific Railroad (Map: Iowa, E 3). It is the seat of Central College (Baptist) and contains an old people's home and the Carnegie-Viersen library. The industrial establishments include feeder works, a canning and pickle factory, roller mills, brick and tile works, a wagon factory, furniture mills, and a tank and pipe factory. The water works and electric-light plant are owned by the city. Pop., 1900, 2623; 1910, 3021. Pella is inhabited for the most part by Hollanders, who began a settlement here in 1847.

PELLA'GRA (Neo-Lat., from It. *pelle agra*, smarting skin). A severe, acute, and chronic disease, nonhereditary, noncontagious, of unknown origin.

History. The malady dates back in Europe to the beginning of the eighteenth century, soon after the introduction of maize into Spain, where it was first observed and described by Gaspar Casal (1691-1759), who mentioned it in his *Historia natural y médica del principado de Asturias* (Madrid). This work was written in 1735, but not printed until 1762, although the first published report about pellagra, in the *Journal de Médecine* (Paris) in 1755, was prepared by François Thiéry, not from his own observations, but based upon Casal's experience. Casal called the disease "mal de la rosa," while the name "pellagra" originated in Italy, where Francesco Fropoli described it in his *Animadversiones in Morbum vulgo Pelligram* (Milan, 1771). In Italy the disease was noticed soon after its appearance in Spain and spread from there to France (1818), the Balkan states, Rumania (1833), Hungary, Egypt, and even to England. Lately it has been observed in the United States where it has increased largely in the South since 1908.

Etiology. The disease may be said to be endemic between lat. 42° and 46° N. and long. 9° W. and 28° E. The exact etiological factor

in the production of pellagra is not definitely known. Six theories have been advanced: 1. The zeistic theory of Bellardini (1845) and Lombroso (1860), giving as the cause a food intoxication from excessive use of altered maize, similar to ergotism (q.v.); this theory was also supported by Neusser (1887), who believed that corn contained a nontoxic glucoside produced by the *Bacillus maidis*, which, becoming decomposed in the human intestine, set free a toxic substance. 2. The photodynamic theory of Raubitscheck (1909), who believed that pellagra was the result of some toxic substance which became active only when sensitized by direct sunlight. 3. The parasitic theory. A parasite, which seemed to be a *Streptococcus*, was isolated by Peltauf and Heider, Zuboni, Tizzoni, and others. This theory was supported by Sambon (1910), who thought that the parasite was being carried and transmitted by the *Simulium* fly in a way analogous to the action of the mosquito in yellow fever (q.v.); and he therefore classified pellagra as a protozoan disease, allied with syphilis and trypanosomiasis. Harris, of New Orleans (1912), was able to produce pellagra in monkeys by inoculating the animals with a filtrate from a case of human pellagra. He believed that the disease was due to a filterable virus capable of passing through a Berkefeld filter. This theory received important support from the Illinois Pellagra Commission and from the Thompson-McFadden Commission (Siler, Garrison, and MacNeal), although Edward Francis, of the United States Public Health Service, was not able to produce the disease in monkeys. 4. The cottonseed-products poison theory advanced by Mizell (1911), which, like the zeistic theory, rested on malnutrition. 5. The drinking-water theory of Alessandrini and Scala (1913), blaming the silica which exists in colloidal solution in drinking water. 6. The starvation theory, or, as suggested by Meyer and Voegtlin (1914), the chronic-intoxication theory, attributing the disease to some poison taken in excess in a largely vegetable diet.

Description. The disease appears in two forms. The chronic form is characterized by symmetrical erythema, appearing usually in the spring, and associated with stomatitis, diarrhea, gastric disturbances, and general malnutrition, followed by profound nervous and mental disturbances, such as headache, backache, spasms, and paralyzes, melancholia, and suicidal mania. As summer advances, the symptoms usually disappear, but recur with the following spring in a more pronounced and enduring form. The acute or fulminating variety of pellagra, called by Lombroso the typhoid form, runs a course of from three weeks to three months and invariably ends fatally.

Treatment. No satisfactory treatment has yet been found. Cases are treated variously according as one theory or another is held regarding the origin. In general, improvement in hygienic surroundings, baths and douches, and a liberal diet, especially of fresh milk, eggs, legumes, and fresh, lean meat with the exclusion of all corn products, combined with tonics, are valuable. Special attention should be paid to the drinking water, seeing that excess of colloidal silica is overcome by calcium carbonate. Good results have been obtained from the use of hexamethylenamine, cacodylate of soda, and salvarsan (q.v.). The transfusion of healthy

blood into the veins of pellagrins has also been tried with some measure of success.

Statistics. Pellagra appears in a more severe form in the United States than in Europe. The governments of the several States have taken steps to exterminate or at least curb the disease. The Italian statistics give interesting material: in 1784 one out of every 20 of the population presented symptoms of pellagra; in 1817, one out of every five or six; in 1827, one-third of the population was affected; in 1888, 117 per million; in 1903, 80 per million; and in 1908, 39 per million, while 7.9 per cent of the insane were pellagrins. In Rumania 40,000 pellagrins were estimated in 1907 in a population of about 6,200,000.

For the United States we find that, for 1900, 2 deaths were reported as from pellagra; 1903, 2; 1904, 1; 1908, 23; 1909, 116; 1910, 368; 1911, 659; 1912, 674; 1913, 1015. For 1913, as for previous years, the excess of females over those of males was very large, 708 females to 307 males. Also the cases among colored people were greatly in excess of those among the white population. But these reports are not true representations of the actual increase in the morbidity, as the registration area in the United States does not include the greater part of the territory in which the disease prevails.

For the period 1907-11, inclusive, Surgeon C. H. Lavinder, of the United States Public Health Service, has compiled some interesting statistics, not based on actual figures throughout, but on all data available:

STATES	Cases reported	Deaths reported	Cases reported and estimated
Virginia	628	349	reported, 15,870 not reported, but estimated, 4,000
North Carolina	2,412	1,067	
South Carolina	1,880	582	
Georgia	4,558	1,582	
Kentucky	513	220	
Alabama	2,314	859	25
Mississippi	2,895	1,250	
Louisiana	670	296	
Maryland			
Tennessee			
Florida			
Arkansas			
Texas			
Illinois and			
Pennsylvania			
All other States			200
Total			25,545

Lavinder, *The Prevalence and Geographic Distribution of Pellagra in the United States* (Washington, 1913); Goldberger and Lorenz, *Cause, Prevention and Treatment of Pellagra* (ib., 1914); Goldberger, Waring, and Willets, *The Treatment and Prevention of Pellagra* (ib., 1914); Alessandrini, Giulio, and Scala, *Contributo nuovo alla etiologia e patogenesi della pellagra* (Rome, 1914).

PELLAT, pà'là' (JOSEPH SOLANGE) HENRI (1850-1909). A French physicist, born at Grenoble. He studied in Paris at the Ecole Normale Supérieure, was assistant in physics at the Paris Observatory (1874), and taught in various lycées until 1893, when he was named adjunct in the scientific faculty of the University of Paris. In 1899 he was promoted to a full professorship. Pellat's especial field of

research was electricity. On thermodynamics also he wrote for the *Journal de Physique* and the *Comptes Rendus*. He invented an electro-dynamometer balance, and other apparatus for the measure of specific inductivity, and wrote *Cours de physique* (1884-86) and *Cours d'électricité* (1901-08), etc.

PELLATT, pèl'at, SIR HENRY MILL (1859-). A Canadian capitalist. He was born in Kingston, Ontario, removed to Toronto in his youth, and was educated at Upper Canada College. Entering the financial service of his father, a stock and money broker, in 1874, he was taken into partnership in 1881 and in 1891 became head of the firm of Pellatt and Macrae. He took a prominent part in the development of electrical power at Niagara Falls and also in the promotion of mining interests in Ontario. He was made president of, or director in, several financial and industrial corporations and contributed largely to various educational and charitable institutions. Pellatt was actively interested in the volunteer militia service, becoming lieutenant colonel commanding the regiment of Queen's Own Rifles in 1906 and colonel in 1907. He commanded the Canadian contingent at Edward VII's coronation in 1902, was knighted in 1905, and was made Commander of the Royal Victorian Order in 1910.

PELLEAS ET MÉLISANDE, pèl'â's' à mǎ'lé'zǎnd'. An opera by Debussy (q.v.), first produced in Paris, April 30, 1902; in the United States, Feb. 19, 1908 (New York).

PELLEGRINO, pèl'lâ-grê'nô, TIBALDI. See TIBALDI, PELLEGRINO.

PELLETAN, pèl'tǎn', CHARLES CAMILLE (1846-1915). A French politician, son of P. C. E. Pelletan. He was born in Paris, studied at the Ecole des Chartes, and entered the political press with boldly republican attacks on the Empire. He became editor of *La Justice* with G. Clémenceau in 1880 and in the following year was elected to the Chamber of Deputies, where he voted with the Radical Left. He was an active opponent of Boulanger. From 1902 to 1905 he held in the Combes cabinet the portfolio of the Navy and came near causing international complications because of his ill-advised speeches in which he foreshadowed a great war of conquest for France. His publications include: *Le théâtre de Versailles* (1876), a collection of his reports on the meetings of the National Assembly; *Question d'histoire: Le comité central et la Commune* (1879); *Georges Clémenceau* (1883); *Les guerres de la Révolution* (1884; 2d ed., 1894); *De 1815 à nos jours* (1892); *Histoire contemporaine* (1902); *Victor Hugo* (1907).

PELLETAN, PIERRE CLÉMENT EUGÈNE (1813-84). A French politician and publicist, father of C. C. Pelletan, born at Royan. He was educated at Poitiers and Paris, was engaged in journalistic work in the latter city from 1837, and incurred the displeasure of the government by the freedom with which he voiced his political convictions. In 1863 he was elected to the Chamber of Deputies, where he sided with the Opposition, and became in 1868 chief editor of the *Tribune Française*, of which he had been a founder. During the Franco-Prussian War he was a member of the Government for National Defense; in 1871 he was elected to the National Assembly and in 1876 to the Senate. Three years afterward he became Vice President of the Senate and in 1884 permanent Senator. He was the

author of *La lampe éteinte* (1840); *Histoire des trois journées de février, 1848* (1848); *Heures de travail* (1854); *Les droits de l'homme* (1858; 2d ed., 1867); *Décadence de la monarchie française* (1860; 3d ed., 1863); *La nouvelle Babylone* (1863); *Elisée: voyage d'un homme à la recherche de lui-même* (1877); *Dieu est-il mort?* (1883). The friendship between Lamartine and himself was dissolved by the publication of Pelletan's *Profession de foi du XIXième siècle* (1852; 3d ed., 1874), *Lettres à un homme tombé* (1857), and *Le monde marche* (1857).

PELLETIER, pèl'tyâ', SIR CHARLES ALPHONSE PANTALÉON (1837-1911). A Canadian statesman, born at Rivière Ouelle, Quebec Province. He was educated in the Ste. Anne de la Pocatière College and Laval University, called to the bar in 1860, and became queen's counsel in 1879. He served in the Fenian Raid of 1866, represented Kamouraska as a Liberal member in the Dominion Parliament in 1869-77 and Quebec East in the Quebec Legislative Assembly in 1873-74, resigning the latter seat on the abolition of dual representation. He was made a Senator in 1877, served as Minister of Agriculture in the Dominion cabinet of Alexander Mackenzie in 1877-78, and was president of the Canadian commission at the Paris Exposition in 1878. He was Speaker of the Dominion Senate in 1896-1901 and became judge of the Superior Court of the Province of Quebec in 1905. Resigning this position in 1908, he was appointed Lieutenant Governor of Quebec, an office which he filled until his death. In 1898 he was knighted (K.C.M.G.).

PELLEW, pèl'wô, EDWARD. See EXMOUTH, VISCOUNT.

PELLEW, HENRY EDWARD (1828-). An American social reformer, son of Dr. George Pellew, dean of Norwich Cathedral, England. He was born at Canterbury and graduated M.A. from Trinity College, Cambridge, in 1853 and in 1870 from Oxford, where he helped found Keble College. Early identified with the work of London hospitals and charities, in 1873 he came to the United States and in association with Theodore Roosevelt, Sr., Abram S. Hewitt, and others organized the New York Bureau of Charities. Night refuges, coffee houses, tenement-house reform, and free circulating libraries were all benefited by his efforts. After 1888 he resided in Washington, D. C., where he paid particular attention to the work among the negroes and to the building of the Washington Cathedral of the Protestant Episcopal church. Pellew served at various times as president of the Association for Improving the Condition of the Poor and of St. George's Society, both in New York.

PELLICANUS (Neo-Lat., skinner, furrier, from Lat. *pellis*, skin; a translation of his German name, *Kürschner*), CONRAD (1478-1556). A Swiss linguist and reformer. He was born at Ruffach in Alsace, studied for a short time at Heidelberg, entered a Franciscan monastery in his native town, and was later transferred to Tübingen. Subsequently he became professor at Basel. He gradually shifted towards Protestantism and in 1526 threw aside his cowl and in the following year became professor of Hebrew at Zurich. He published the first Hebrew grammar written in a European language (1504; reprinted in phototype, 1877); his other works are an autobiography (published in Latin at Basel, 1877, and in German, Strassburg, 1891)

and a biblical commentary in seven volumes (1532-39). Consult Reuss, *Konrad Pellicanus* (Strassburg, 1893), and Silberstein, *Conrad Pellicanus* (Berlin, 1900).

PELLICO, pèl'lè-kò, SILVIO (1788-1854). An Italian poet, celebrated for his long and cruel imprisonment by the Austrians. He was born June 24, 1788, at Saluzzo in Piedmont. In his sixteenth year he went to Lyons, where he stayed, giving his time mostly to French literature, until Foscolo's *Carme de' sepolcri* awakened in him a strong patriotic feeling and an irresistible longing to return to Italy. About 1810 he went with his family to Milan, where he was professor of French in the Collegio degli Orfani Militari, and he also served as tutor in the family of Count Porro, in whose house the most distinguished men in Milan were wont to meet. His tragedy *Francesca da Rimini* (1818), weak in plot, character delineation, and style, brought him popular applause through its sincere Italian sentiment. He was editor in chief of a liberal periodical called *Il Conciliatore*, which for its nationalistic propaganda was suppressed. For belonging to the Carbonari (q.v.) Pellico was arrested in 1820 and sent to the prison of Santa Margherita at Milan, where his friend the poet Maroncelli was also confined. In 1822 he was taken to the prison on the isle of San Michele, near Venice. Maroncelli and he were at last condemned to death; but the Emperor commuted the sentence to 20 years' imprisonment for Maroncelli and 15 years for Pellico. In March, 1822, they were both conveyed to the subterranean dungeons of the Spielberg, near Brünn, in Moravia. In August, 1830, however, they were set at liberty. Pellico published an account of his sufferings during his 10 years' imprisonment under the title *Le mie prigioni* (1832). His health had been permanently injured. The Marchioness of Barolo received him into her house at Turin as her secretary. He died at Turin, Jan. 31, 1854. His 12 tragedies, eight of which he published, and nearly all of which deal with mediæval subjects, and the verse novels and lyrics (*Poesie inedite di Silvio Pellico*, Turin, 1837) and *Poesie* (Florence, 1869), written between 1834 and 1837, have small merit. Pellico is sentimental, but his piety is sincere. His sufferings of mind and of body broke down his belief in the right to resist. In his later life he claimed that Providence must accomplish the redemption of Italy. His correspondence (*Epistolario*, Florence, 1856, and later editions, 1858, 1861, 1874, 1877) reveals his tendency to mystical contemplation. His fame rests on a narration of extraordinary simplicity and beauty, free from resentment or partisanship and breathing faith in the underlying goodness of humanity. The style has a natural elegance which compares well with that of Manzoni. *Le mie prigioni* has been translated into many languages. Consult: Bourbon, *Silvio Pellico, sa vie et sa mort* (Paris, 1879); Ilario Rinieri, *Della vita e delle opere di Silvio Pellico* (Turin, 1899-1901); L. Mancini, *Le tragedie di Silvio Pellico avanti la sua prigionia* (Senigallia, 1899); Egidio Belforini, "Le idee letterarie di Silvio Pellico," in *Giornale Storico*, vol. xlvii (Turin, 1906); Ricarda Huch, *Das Risorgimento* (Leipzig, 1908).

PELLISOV, pèl'lè-zòf, EMIL. See SCHAF-HÄUTL, KARL FRANZ EMIL VON.

PELLISSIER, pèl'lès-yà', GEORGES (1852-). A French critic, born in Monflanquin (Lot-et-Garonne). He contributed to many periodicals, especially to *La Revue*, for which he was the monthly literary critic with E. Faguet. He showed great independence in the Dreyfus case and afterward. He was created Knight of the Legion of Honor. He wrote several books, but especially is famous for his remarkable *Mouvement littéraire au XIX siècle* (1889), followed in 1901 by *Mouvement littéraire contemporain*. He was also professor of rhetoric at the Lycée Janson-de-Sailly, Paris (1904). His articles are gathered in several volumes as *Essais de littérature contemporaine* (1893); *Nouveaux essais* (1894); *Études de littérature contemporaine* (1901); *Précis de l'histoire de la littérature française* (1902), an excellent manual; *Études de littérature et de morale* (1905); *Voltaire philosophe* (1908); *Anthologie du théâtre français contemporain* (1910); *Anthologie des prosateurs français* (1910-13); *Anthologie des poètes du XIXe siècle* (1911); *Le dix-huitième siècle par les textes* (1911); *Le réalisme du romantisme* (1912); *Shakespeare et la superstition shakespearienne* (1914).

PEL'LITORY (Lat. *parietarius*, belonging to walls, from *paries*, wall: corrupt. from *paritory*) **OF SPAIN**, *Anacyclus pyrethrum*. A plant of the family Composite. Its small, spindle-shaped, fleshy, acrid root has very often been used medicinally in parts of Europe and in northern Africa, where it is native. *Anacyclus officinarum* yields the German pyrethrum root.

PELOP'IDAS (Lat., from Gk. Πελοπίδας) (?-364 B.C.). A Theban general and patriot, the associate of Epaminondas. He belonged to a good family and was in affluent circumstances. In 382 B.C. he was driven from Thebes by the oligarchic party, supported by the Spartans, and took refuge at Athens, but returned with a few associates in 379 B.C., recovered possession of the Cadmeia (or citadel), slew the Spartan leader, Leontiades, with his own hand, and established a democratic form of government. His Sacred Band of Theban youth, 300 in number, contributed largely to the victory of Epaminondas at Leuctra (371), but failed in a subsequent attack on Sparta itself. In the expedition of the Thebans against the cruel tyrant Alexander of Phœræ (368) he was treacherously taken prisoner, when in the character of an ambassador, but was rescued by Epaminondas in the following year. He was then sent (367) to Susa as Ambassador from Thebes. In 364 he defeated Alexander of Phœræ at Cynoscephalæ, but was himself killed. Consult Plutarch's and Nepos's *Life of Pelopidas*.

PELOPONNE'SIAN WAR. See GREECE.

PELOPONNE'SUS (Lat., from Gk. Πελοπόννησος, island of Pelops). The ancient name of the peninsula forming the southern part of ancient Greece, now called the Morea (q.v.). It is separated from the mainland by the Corinthian and Saronic gulfs and united with it only by the narrow Isthmus of Corinth. It was divided into six districts: Argolis, on the northeast; Laconia, on the southeast; Messenia, on the southwest; Elis, on the west; Achæa, on the north; and Arcadia, in the centre. The most famous cities were Mycenæ, Sicyon, Tiryns, Corinth, Argos, Trœzen, and Epidaurus in Argolis, Sparta in Laconia, Messene, Pylos, and Methone in Messenia, Elis in Elis, Patræ and

Ægium in Achæa, and Tegea, Mantinea, and Megalopolis in Arcadia. After the conquest by the Dorians the supremacy of Sparta in the Peloponnesus was established and was maintained until the battle of Leuctra (371 B.C.), which was followed by the Theban invasion under Epaminondas (q.v.), the restoration of the Messenians, and the founding of Megalopolis (q.v.). The Peloponnesus was the scene of internal strife until the Roman conquest (146 B.C.), when it became part of the Province of Achaia. Consult: W. M. Leake, *Travels in the Morca* (London, 1830); Blouet, *Expédition scientifique du Moroc* (Paris, 1831-38); W. M. Leake, *Peloponnesiaca* (London, 1846); Ernst Curtius, *Peloponnesos* (Gotha, 1851-52); Alfred Philippson, *Der Peloponnes* (Berlin, 1892). See GREECE, *History*.

PELOPS (Lat., from Gk. Πέλοψ). In Greek legend, the son of Tantalus, King of Phrygia. His father was especially loved of the gods, but at a feast at which they were present he slew and served to them his son. The gods, recognizing the nature of the food, refused it, with the exception of Demeter, who, absorbed in grief at the loss of her daughter, devoured a shoulder. At the command of Zeus, Hermes threw the members into a caldron from which Clotho drew the boy restored to life, while Demeter replaced the lost shoulder by one of ivory. Later legend told of the love of Poseidon for the beautiful youth, and his gift to Pelops of winged horses of matchless speed, by whose aid and the treachery of Myrtilus he was enabled to win the hand of Hippodamia, daughter of Ænomaus, King of Elis. Each suitor was required to take Hippodamia in his chariot and start from Olympia for Corinth, while Ænomaus offered a sacrifice to Zeus and then pursued. As his horses were a gift of the gods, Ænomaus had hitherto overtaken and slain 13 luckless lovers. Pelops bribed Myrtilus, Ænomaus' charioteer, to draw the linclpin and thus secured the victory and the death of Ænomaus. He, however, refused to pay Myrtilus his reward and even cast him into the sea, wherefore Myrtilus cursed the whole race of Pelops. It may be observed that the Homeric poems know nothing of this curse and the subsequent horrors, which furnished so much material to the Attic dramatists. While the ordinary versions localized this story at Olympia and associated the Olympic games with Pelops, there are many indications that the race was in some versions considered as crossing the water to or from Lesbos. Of the later fortunes of Pelops many versions were current. He was the father by Hippodamia of Atreus, Thyestes, and other children, and by Axioche of Chrysippus, who was carried off by Laius of Thebes, or murdered by his jealous brothers and stepmother, thus beginning the woes of the family. At Olympia Pelops was especially honored in a sacred inclosure, the Pelopion, where a black wether was yearly offered to him.

PELO'RIA (Neo-Lat., from Gk. Πέλωρ, *pelôr*, monster). A malformation occurring in flowers which are normally irregular, by which regularity is again attained. It was first described by Linnaeus, who found the spurred flowers of the butter and eggs, or toadflax (*Linaria vulgaris*), with five spurred petals instead of the normal one. The cause of such malformations has not been fully determined, though peloria has been produced by a change in the relation

of the plant to light, one-sided illumination appearing favorable to its development.

PELO'RUS. See COMPASS.

PELOTA, pá-lô'tà, or JAI ALAI (Sp., from *pilota*, *pelota*, little ball, from Lat. *pila*, ball). A Basque game introduced into the South American republics and to Cuba from the northern provinces of Spain and imported thence to the United States. It can be played either in or out of doors. Its necessities are a *concha*, or court, with level concrete floor 200 feet long and 65 feet wide, with a wall 36 feet square, called the *frontis*, or front wall, at one end, and at the opposite another similar wall, called *la pared de rebote*, or rebounding wall. On the front wall iron strips painted red mark the boundaries within which the ball must strike. On the floor of the court, occupying the whole space between the two ends, are also boundary

lines within which the ball must, on its rebound, strike to be counted. A narrow strip, 29 feet, parallel with the concha is the *contra-concha*, within which the ball must remain to avoid being counted as a fault. The instrument with which the game is played is a light wickerwork basket arrangement fastened to the hand by means of a glove attachment. It is called a *cesta*. The ball is about the size of a lawn-tennis ball. It has a core of India rubber bound round with yarn and is covered with sheepskin, or it may be made of solid rubber.

The game is played by four, six, or eight players, mostly by four, two on each side, one of whom on each team is the *delantaro*, or forward, and the other the *zaguero*, or back. Play is on when the forward of the side first entitled to do so runs to a certain mark on the court and throws the ball to the floor, catching it on the bound in the basket attached to his hand and striking it against the front wall within the red-lined boundaries, whence it should rebound so as to touch the floor between the lines thereon defined. The forward of the opposing side must then strike it with his basketed hand either while it is in the air as it rebounds or on its first bound from the floor and throw it against the front wall again; and so on by each team in turn until one side loses the point. If the ball falls or strikes outside the boundaries, it is a fault to the credit of the opponent. No player may hold the ball in his hand or in the basket; it must always be kept in motion. The first team to gain 50 points wins the game.

PELOTAS, pá-lô'tàs. A town in the State of Rio Grande do Sul, Brazil, 26 miles northwest of the city of that name, on the São Gonçalo River and the Rio Grande Railways (Map: Argentina, J 4). It is a well-built, handsome city and the centre of an extensive interior and

coastwise trade. The principal industry is the curing and preserving of meats, and in addition there are extensive exports of hides, horns, and tallow. Pop. (est.), 32,000.

PELOUBET, pel'oo-bét, FRANCIS NATHAN (1831-). An American biblical scholar, born in New York City. He graduated at Williams in 1853 and at Bangor Theological Seminary in 1857 and for 25 years was pastor of Congregational churches in Massachusetts. In 1884 and 1912 he revised Smith's *Bible Dictionary*. Peloubet's *Select Notes on the International Sunday-School Lessons* (1875-1912) and his *Sunday-School Quarterlies* (1880-1912, in four grades) became widely known. He was also author of *Suggestive Illustrations on Matthew, John, and Acts* (3 vols., 1898-99); *Loom of Life* (1900); *Front Line of the Sunday-School Movement* (1904); *Studies in the Book of Job* (1906); *Oriental Light Illuminating Bible Texts and Bible Truths* (1914). With A. D. Adams he edited the *International Bible Dictionary* (1914).

PELOUZE, pe-looz', THÉOPHILE JULES (1807-67). A French chemist. He was assistant to Gay-Lussac and later professor of chemistry at the Ecole Polytechnique and the Collège de France. In 1836 he was associated in research work with Liebig and in 1837 became a member of the Institute. Pelouze carried out a number of valuable investigations in organic and industrial chemistry and published several works; jointly with Frémy he wrote a *Traité de chimie générale*, which passed through several editions.

PELTIER, pèl'tyá', JEAN CHARLES ATHANASE (1785-1845). A French physicist and meteorologist, born at Ham (Somme). He was early a watchmaker, but gave up his craft at the age of 30 to apply himself to experimental science. He made several important discoveries in electricity and meteorology. The so-called Peltier Effect discovered by him involved the production of cold by the passage of an electric current through a joint of dissimilar metals. He published a number of interesting memoirs, including *Mémoire sur la météorologie électrique* (1844); also an excellent work on water spouts entitled *Météorologie: Observations et recherches expérimentales sur les causes qui concourent à la formation des trombes* (1880). Consult Peltier, fils, *Notice sur la vie et les travaux de J. C. A. Peltier* (Paris, 1847), and "Memoir of Peltier," in *Smithsonian Report* for 1867.

PELTRIE, pèl'trè', MADAME DE LA (c.1602-71). A French church benefactor. She was born in Alençon, Normandy. After the death of her husband she came to Quebec, Canada, about 1637 and devoted her wealth to the founding of the Ursuline convent in that city. She was associated in this work with Madame Martin, better known as Mary of the Incarnation (q.v.).

PELU'SIOTA. See ISIDORUS, SAINT.

PELU'SIUM (Lat., from Gk. Πηλουσίον, mud city; Egypt. Am; probably, though not certainly, identical with the ancient *Avaris* and the *Sin* of the Old Testament; also called, in Coptic and Arabic, *Pérémoun*, *El-Fermâ*, *Far-amâ*). An ancient Egyptian city, situated a few miles from the Mediterranean, at the extreme northeast corner of the delta of the Nile, important as the key of Egypt on the Asiatic side. The easternmost mouth of the Nile derived from it the name Pelusiac. Pelusium was

the last stronghold of the Hyksos and was finally taken by Amasis I. It was the scene of Sennacherib's defeat (2 Kings xviii, xix). On this occasion, according to Herodotus, the camp of the Assyrians was invaded at night by a host of field mice, who gnawed their bowstrings and shield straps, so that in the morning, when the Egyptians fell upon them, they were defenseless. In 525 B.C. the Persians, under Cambyses, defeated the forces of Psammetichus III near Pelusium and overthrew the native Egyptian dynasty. The city was taken by Iphicrates and Pharnabazus in 374 B.C. and was besieged and conquered by the Persians in 369 B.C. In 170 B.C. it was the scene of the defeat of Ptolemy Philometor by Antiochus Epiphanes, and in 55 B.C. it was captured by Marcus Antonius. After the battle of Actium in 31 B.C. it fell into the hands of the Romans. It was, according to one account, the birthplace of Ptolemy the astronomer. At present the place is in ruins and nearly level with the surrounding country. Consult: Johannes Dümichen, *Geschichte des alten Aegyptens* (Berlin, 1879); Meyer, *Geschichte des Alterthums* (Stuttgart, 1884-93); W. M. Flinders Petrie, *Tanis* (London, 1885-88); E. Amélineau, *Géographie de l'Égypte à l'époque copte* (Paris, 1893); article "Pelusium" in Friedrich Lübker, *Reallexicon des klassischen Alterthums*, vol. ii (8th ed., Leipzig, 1914).

PELVIC GIRDLE (from Lat. *pelvis*, basin; connected with Gk. πέλνῃ, *pelyx*, πέλλις, *pellis*, πέλλα, *pella*, bowl). The pelvic girdle is that part of the vertebrate skeleton which serves for the connection of the hind limbs with the back. Among fishes there is no true girdle, although cartilaginous plates and rods lying in the muscular tissues of the ventral side, and often connected with the pelvic fins, are regarded as rudiments of such a structure. These are best developed in dipnoid fishes, but are quite distinct in the sharks and rays. In the Batrachia we find a well-formed pelvic girdle made up of three parts—a dorsal ilium, an anterior ventral pubis, and a posterior ischium. Each part is made up of a pair of bones, one on each side of the body, and the iliac bones are connected with the sacral vertebrae; the femur articulates with the pelvis at a point known as acetabulum, where the iliac, pubic, and ischial bones meet. In some salamanders an epipubis is present, consisting of a slender bifurcated rod of cartilage projecting forward from the anterior edge of the pubis. In frogs and toads the iliac bones are very long, while the ischium and pubis are completely fused with the posterior portion of the ilium into a single piece. Among reptiles the same essential elements are present in the pelvic girdle, and the pubic and ischial bones are united ventrally, more or less perfectly. In crocodiles there is a prolongation of the iliac bone in front of the acetabulum. In birds this prolongation is very marked, but the relative proportion of anterior and posterior parts of the ilium differs greatly in different birds. The pubic bones of birds extend backward parallel with the ischial and in many birds fusing with them. All the parts of the pelvis of birds tend to become ankylosed, but a pubic symphysis is present only in the ostrich, and an ischial symphysis occurs only in the rhea. Among mammals the pelvic girdle shows much variety. Both pubic and ischial symphyses occur in monotremes, marsupials, many rodents,

insectivores, ungulates, and carnivores. The pubic symphysis is wanting in bats and some insectivores, while the ischiac symphysis fails in many insectivores and carnivores and in the primates. In monotremes and marsupials there are present well-developed epipubic bones, known as marsupial bones, though they are not concerned in any way with the marsupium; they are associated with the muscles governing the mammary glands. A fourth element, the pars acetabularis, enters into the formation of the pelvis in the crocodile, birds, and many mammals, and it often shuts the pubis out from a part in forming the acetabulum; occasionally the ischiac bones are also excluded, as in the mole. The pelvic girdle has no fixed position throughout any class, but varies greatly according to the position and function of the hind legs. A pelvis is lacking in the apodous batrachians, in all snakes (with rare exceptions), in a few lizards, and in the Sirenia and Cetacea it is either wanting or reduced to a rudimentary ilium. Consult R. E. E. Wiedersheim, *Comparative Anatomy of Vertebrates*, translated by W. N. Parker (3d ed., New York, 1907).

PELVIC INDEX. See INDEX.

PELVIS (Lat., basin). A bony ring interposed between the spinal column and the lower extremities, so as to transmit the weight of the former to the latter. It is made up of four bones, viz., the two ossa innominata, which constitute its sides and front, and the sacrum and coccyx, which complete it behind. The os innominatum receives its name from its bearing no resemblance to any known body and is a large irregular-shaped bone. In the young subject it consists of three segments, which meet and form the cup-shaped cavity (the acetabulum) in which the head of the thigh bone rests. Hence it is usual to describe this bone as consisting of the ilium, the ischium, and the pubes.

usually feel the part through which the weight is transmitted. The pubes is that portion which runs horizontally inward from the inner side of the acetabulum for about 2 inches and then descends obliquely outward for about the same length, thus making an acute angle with its original direction. The former part is called the body, and the latter the ramus, of the pubes. The ramus is continuous with the ramus of the ischium. Between the ischium and the pubes is a large aperture, known as the thyroid or obturator foramen, which in the living body is closed by a membrane termed the obturator membrane. The object of this large foramen is probably to give lightness to the parts without materially diminishing their strength.

The pelvis, considered as a whole, is divisible into a false and a true pelvis. The false pelvis is all that expanded portion which is bounded laterally by the iliac bones, and lies above the prominent line termed the linea ileo-pectinea; while the true pelvis is all that part of the general pelvic cavity which is situated below that line. The broad, shallow cavity of the

FIG. 2. PELVIS (FEMALE ADULT) SEEN FROM THE FRONT.

FIG. 1. OS INNOMINATUM OF THE RIGHT SIDE (outer surface).

The ilium is the superior, broad, and expanded portion which forms the prominence of the hip and articulates with the sacrum. The ischium is the inferior and strongest portion of the bone. It consists of a thick and solid portion, the body (whose inferior border is termed the tuberosity), and a thin ascending portion, the ramus. In the ordinary sitting position the weight of the body rests principally on the ischium; and by sitting on the hands we can

false pelvis serves to support the weight of the intestines; while the rectum, bladder, and part of the generative organs lie in the cavity of the true pelvis. The upper aperture of the true pelvis is termed the inlet. It is somewhat heart-shaped in form and has three principal diameters—an anteroposterior (or sacropubic), which extends from the angle formed by the sacrum with the last lumbar vertebra to the symphysis pubis, or point of union of the two pubic bones; the transverse, at right angles to the former and extending across the greatest width of the pelvis; and the oblique, extending from the sacroiliac symphysis (or union) on one side to the margin of the brim corresponding with the acetabulum on the other. The diameters of the outlet are two—an anteroposterior, extending from the tip of the coccyx to the lower part of the symphysis pubis, and a transverse, from the posterior part of one ischiatic tuberosity to the same point on the opposite side. As the precise knowledge of the diameter and depth of the pelvis is of the greatest importance in the practice of midwifery, we give the average numbers representing the dimensions of a well-formed adult female pelvis. Diameters of inlet or brim—anteroposterior, 4.4 inches; transverse, 5.4 inches; oblique, 4.8 inches. Diameters of outlet—anteroposterior, 5 inches; transverse, 4.3 inches. Depth of the true pelvis—posteriorly, 4.5 inches; in the middle, 3.5 inches; anteriorly, 1.5 inches.

The pelvis is placed obliquely with regard to the trunk of the body, the plane of the inlet to the true pelvis forming an angle of from 60° to 65° with the horizon. According to Gray the

extremity of the coccyx is in the female, when standing upright, about $\frac{1}{2}$ inch higher than the lower edge of the symphysis pubis, the upper edge of the symphysis being at the same level as the lower edge of the second segment of the coccyx. The shape of the human pelvis is much affected by the curving forward of the lower part of the sacrum. This bend of the sacrum forward serves to support the viscera when the body is in an erect posture, but it is of much more importance in its relation to the act of parturition. If all the anteroposterior diameters of the true pelvis from the brim to the outlet were bisected, the points of bisection would form a curved line similar to the curve of the sacrum and termed the axis of the pelvis. As the head of the child has to follow this curve, the difficulties of parturition are much greater than if the axis of the pelvis had been straight as in the other vertebrata. Without entering into unnecessary details, we may remark, generally, that the fetal head is usually of oval shape, with its greatest diameter from before backward, and that in its passage through the pelvis it is so placed that its longest diameter at each stage of labor coincides with the longest diameter of the pelvis. The head enters the pelvis with the occiput (or back of the skull) directed towards one ilium and the face towards the other, while at its final emergence the face is turned towards the sacrum and coccyx. This screwlike or rotatory motion facilitates the passage of the fetal head through the pelvis.

There are well-marked differences between the male and the female pelvis. In the female the bones are lighter and more delicate than in the male and the muscular impressions and eminences are less distinctly marked. The iliac fossae are large and expanded, and hence the great prominence of the hips. The several diameters (particularly the transverse diameter of the brim, which measures only 5.1 inches in the male) are somewhat greater, and the pubic arch is wider by about 10 degrees; the sacrum also is wider and less curved.

It is worthy of notice that the pelvis of the negro is smaller in all its dimensions than that of the European and presents a partial approximation to that of the monkey, especially in the deficiency of its width. This difference is more obvious in the male than in the female negro; and parturition in the black races is facilitated both by the sacrum being less curved and by the fetal head being of smaller dimensions. In the apes and monkeys, which approach most nearly to man, the pelvis is longer and narrower and much less curved than in the human subject. In other mammals the differences are for the most part the same in kind, but greater in degree. In many of the *Chiroptera* (bats) and *Insectivora* (as the mole) the pubic bones are only loosely connected by a small ligament, or there is a complete opening between the bones (as occurs normally in birds), an arrangement by which the act of parturition in these animals is much facilitated. The pelvic bones are very simple in the *Cetacea*, in some cases being represented by two plain, elongated bones lying near the anus and converging from opposite sides (a transverse connecting piece being sometimes but not always present); in others by a small V-shaped bone; while sometimes (as in *Manatus*) they seem to be entirely wanting. The additional pelvic bones in the

nonplacental mammals have been already noticed in the article on the *MARSUPIALIA*. In the *Echidna*, which belongs to the *Prototheria* (q.v.), the acetabulum is perforated, as occurs normally in birds. In birds, in addition to the peculiarity just noticed, we find the pelvis open in front (or, more correctly, inferiorly), there being no union of the pubic bones in any bird except the ostrich. This normal incompleteness of the pelvic ring is obviously for the purpose of facilitating the passage of the eggs.

PELZ, pēlz, PAUL JOHANNES (1841-). An American architect. He was born at Seidentorf, Silesia, Germany, studied at colleges in Breslau, joined his father, a political refugee, in the United States in 1857, and in 1859-66 studied architecture under Detlef Lienau in New York. Subsequently he designed many lighthouses for the United States government, but is best known for his work on the Congressional Library Building, Washington; the Georgetown College Academic Building; Carnegie Library and Music Hall, Allegheny, Pa.; United States Government Army and Navy Hospital, Hot Springs, Ark.; Machinery Hall, St. Louis Exposition; Chamberlain Hotel, Old Point Comfort, Va.; Clinic Hospital, University of Virginia.

PEMBA. A coral island on the east coast of Africa, 30 miles north of Zanzibar (Map: Africa, J 5). It is in the dominions of the Sultan of Zanzibar, but under the protectorate of England. It is about 35 miles long, with an area of 380 square miles, covered in the interior by low hills up to 600 feet. It has a luxuriant vegetation and produces rice, maize, and sugar cane, but since the abolition of slavery on the island agriculture has been neglected. The output in recent years has been cloves and coconuts. The population is estimated at 60,000, mostly of Bantu stock. The chief town is Chaka, with a population of 5000.

PEMBERTON. A town in Lancashire, England, 2 miles southwest of Wigan. It has manufactures of cottons, chemicals, bricks, and iron products. There are coal mines and stone quarries in the vicinity. The municipality owns its electric-lighting plant. Pop., 1901, 21,600; 1911, 23,642.

PEMBERTON, JOHN CLIFFORD (1814-81). An American soldier, born in Philadelphia. He graduated at West Point in 1837 and was commissioned second lieutenant of the Fourth Artillery. During the Mexican War he was aid to General Worth and was brevetted captain for gallantry at Monterey and major after Molino del Rey. In 1848 he married Miss Martha Thompson, of Norfolk, Va. On the outbreak of the Civil War he refused to serve against the South. On June 15, 1861, he was commissioned major of artillery in the Confederate army, and on June 17 brigadier general. He served north of the Nansemond River in Virginia until November, 1861, when he was transferred to the Eighth Military District of South Carolina. In January, 1862, he was promoted to be major general and placed in charge of the Department of South Carolina, Georgia, and East Florida. He was promoted to be lieutenant general Oct. 13, 1862, and was placed in charge of Mississippi and east Louisiana, succeeding General Van Dorn. He disobeyed the orders of his superior, General Johnston, to unite with him near Jackson, next to strike General Grant's rear at Clinton, and finally to evacuate Vicksburg. His correspondence with General Johnston was be-

trayed to General Grant, and he was sharply defeated at Baker's Creek or Champion's Hill, May 16, 1863, and at Big Black Bridge the next day. When he retired into Vicksburg he conducted the defense with skill until July 4, when he surrendered 31,600 men and 172 cannon. His course met with so much criticism that he resigned his commission after his exchange, but in May, 1864, was placed in charge of the artillery defenses of Richmond, with the rank of lieutenant colonel, and served here until the end of the war. He then engaged in farming in Virginia until 1876, in which year he removed to Pennsylvania. Consult for Vicksburg, Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887).

PEMBERTON, MAX (1863-). An English romancer, born in Birmingham. After graduating from Caius College, Cambridge, he joined the staff of *Vanity Fair* (1885). He also began writing stories and miscellaneous articles for several London periodicals, was editor of *Chums* (1892-93), and from 1896 to 1906 edited *Cassell's Magazine*. Among his romances are: *The Iron Pirate* (1893); *Queen of the Jesters* (1897); *The Garden of Swords* (1899); *Féu* (1900); *House under the Sea* (1902); *Beatrice of Venice* (1904); *My Sword for Lafayette* (1906); *The Show Girl* (1909); *Captain Black* (1911); *War and the Woman* (1912); *Two Women* (1914); *The Lady Evelyn* (1915). Pemberton also produced the play called *Garriick* in 1913.

PEMBROKE, pēm'brūk. A seaport town, parliamentary and municipal borough, and the capital of Pembrokeshire, Wales, 42 miles west of Swansea (Map: Wales, B 5). Pater, otherwise called Pembroke Dock, an important fortified government dockyard, 2 miles from the town, embraces an area of 90 acres and provides the chief industry of the neighborhood. On the extremity of the ridge on which the town is built are the remains of its extensive castle, founded in 1094, and the birthplace of Henry VII. Beneath the ruins is a remarkable natural cavern, which had communications with both the castle and the harbor. In 1648 the castle was beleaguered by Cromwell and taken after a siege of six weeks. The town dates from the early years of British history. It owns its water supply, slaughterhouses, and markets. Pop. (municipal borough, including Pembroke Dock), 1901, 15,853; 1911, 15,673.

PEMBROKE. A municipality of Leinster, Ireland, constituting a southeast suburb of Dublin. Pop., 1901, 25,799; 1911, 29,294.

PEMBROKE, pēm'brök. A town and the county seat of Renfrew County, Ontario, Canada, on the Ottawa River and on the Canadian Pacific and Grand Trunk railways, 105 miles by rail from Ottawa (Map: Ontario, H 2). The town possesses fine municipal buildings and two hospitals, and its industrial establishments include lumber, saw, shoo, steel, and woolen mills, a steel and equipment mill, and manufactories of builders' materials, machine-shop products, stoves, carriages, lumbering tools, leather, gloves, moocasins, incubators, and bricks. Pop., 1901, 5156; 1911, 5626.

PEMBROKE. A town in Merrimack Co., N. H., about 6 miles south of Concord, on the Merrimack River and on the Boston and Maine Railroad (Map: New Hampshire, F 7). It contains the Pembroke Academy, a sanitarium, and the Josie Langmaid and Soldiers monuments,

Farming, poultry raising, and the manufacture of cotton goods are the chief industries. Pop., 1900, 3183; 1910, 3062.

PEMBROKE, pēm'brūk, EARL OF. A title of the British family of Herbert (q.v.).

PEMBROKE COLLEGE. A college at Cambridge, England. It was founded by Mary de St. Paul, wife of Aymer de Valence, in 1347. It has always occupied an honorable place among Cambridge colleges and has had among its members some of the most distinguished men in England. Of these the greatest are Pitt, the poets Spenser and Gray, Archbishops Whitgift, Grindal, and Rotherham, the martyrs Ridley, Rogers, and Bradford. The college library, of some 20,000 volumes, is one of the most interesting and valuable college collections in Cambridge. There are 13 fellowships and 29 scholarships, and in 1913-14 there were 293 undergraduates.

PEMBROKE COLLEGE. A college at Oxford, England. It was founded by James I in 1624 and endowed by Thomas Tesdale, of Glympton, Oxfordshire, and Richard Wightwick, B.D., rector of Ilsey, Berks. It took its name from William, Earl of Pembroke, then chancellor of the university. Its buildings, though not large, are quite modern and very attractive. The college in 1913-14 had a master, 7 fellowships, several honorary fellows and lecturers, 32 scholars, and about 150 undergraduates in all. Never a large college, a number of distinguished men have been connected with it, especially in the seventeenth and eighteenth centuries. Among these may be mentioned Camden the antiquary, John Pym, Beaumont the dramatist, George Whitefield, Sir William Blackstone, Shenstone, Sir Thomas Browne, and Samuel Johnson. Consult Douglas Maclean, *Pembroke College* (London, 1900).

PEMBROKESHIRE, pēm'brūk-shēr. The westernmost county of Wales, bounded north and west by St. George's Channel, east by Cardigan and Carmarthen, south by the Bristol Channel (Map: Wales, B 5). Area, 614 square miles. The surface is undulating. The principal elevations are the Precelly Hills, which traverse the north of the county from east to west and attain a maximum altitude of 1754 feet. The chief river is the Leifi. The Eastern and Western Cleddan unite and form a navigable portion of Milford Haven. The north and west shores are indented with fine bays and dotted with islands; the estuary of Milford Haven forms one of the best harbors on the coast of Great Britain; the south shores are wild and rugged, fronted with precipitous cliffs. The climate is mild but damp. There are excellent and productive soils in the south, and along the northwest coast the barley districts are famous. Oats, barley, and potatoes are the principal crops. Coal, iron, zinc, and lead are mined and slate is quarried. Fine breeds of horses are raised. There are important fisheries. The chief towns are Pembroke (the capital), St. Davids, Tenby, Fishguard, and Haverfordwest. Pop., 1901, 88,732; 1911, 89,960.

PEMELL, RICHARD BICKERTON. See LYONS, R. B. PEMELL, LOED.

PEMMICAN (Cree Indian name). An Indian food preparation much used among all the tribes east of the Rocky Mountains except those in the extreme south, and consisting of lean dried meat of buffalo, deer, or, in modern days, beef, pounded to a powder and liberally mixed with boiling fat, which is poured over it. It is

then pressed into cakes and packed into par-fleche (rawhide) cases until needed. Berries are frequently pounded up and mixed with the meat. Pemican contains a great amount of nutriment in compact form, and when thus prepared will continue sweet and good for an indefinite time so long as it is kept dry. It is the staple commissary article of hunters, traders, and other travelers throughout the great Northwest, and especially of Arctic and Antarctic explorers.

PEMPHIGUS (Neo-Lat., from Gk. *πέμφιξ*, *pemphix*, bubble), or **POMPHOLYX**. A disease of the skin in which appear on its surface blebs or bullæ filled with serum, pus, or blood, with itching, fever, and great impairment of the general health. Similar blebs appear on the mucous membrane. The blebs burst after a time, leaving a rough, reddened surface, and scaling occurs in the variety termed *pemphigus foliaceus*. This variety is always chronic and an attack lasts from several months to several years, successive crops of bullæ appearing and rupturing. In *pemphigus vulgaris*, which may be acute or chronic, the vesicles contain clear serum at first. This variety may last but two or three weeks, but it may last for months or years and terminate fatally. A rare form, *pemphigus vegetans*, has been described by Neumann. In this form warty vegetations develop upon the denuded surfaces. In the treatment of this disease arsenic, strychnine, iron, and quinine are given internally, local applications of a sedative nature are made, and warm baths are given for months, the patients being suspended under water upon a hammock night and day.

PEN (OF., Fr. *penne*, from Lat. *penna*, pen, feather, OLat. *pesna*, feather; probably connected with Gk. *πτερόν*, *pteron*, OHG. *fedara*, Ger. *Feder*, AS. *feþar*, Eng. *feather*, Skt. *Patatra*, feather, from *pat*, to fly). An instrument for writing with a fluid ink. For many centuries the quill pen was the only kind used, and when metal was employed its forms were copied. Bronze pens were found in Pompeii, and Isidore of Seville, who died 636 A.D., mentions reeds and pens among the instruments employed in writing. A century and a half later Alcuin writes of the use of pens. Probably their general use began with the introduction of modern paper, and the use of the quill pen persisted until long after the middle of the nineteenth century.

Steel Pens. Towards the close of the eighteenth century various experiments were made towards the manufacture of steel pens. At first they were barrel-shaped and as much like a quill pen as possible, being made by bending a flat piece of steel into a tube and then filing it into shape, the joint of the two edges forming the slit. These pens were expensive and unsatisfactory, for they were hard and inflexible. In 1820 Joseph Gillott, of England, began the manufacture of steel pens and greatly improved their form. He also cheapened their price by introducing machinery for their manufacture. Presses were contrived for cutting, bending, and marking, and other machinery for cleaning and polishing. The manufacture of steel pens was not introduced into the United States until about 1860. By that time the art had been perfected and a knowledge of the varieties of steel best adapted for pens had been acquired. Most of the steel used in American factories is imported from England or Sweden. It is received by the manufacturer in sheets of varying thick-

ness and is prepared for conversion into pens by a preliminary process of annealing, polishing, and rolling. The last-named operation requires considerable care and skill, for the steel must be passed between successive rollers until reduced to a required thickness, which averages about 0.009 inch. The slightest variation in the thickness of the sheet affects the flexibility of the finished pen. The blanks, which are cut in screw presses, are next stamped or pressed into the desired shape, and then the small hole which terminates the slit in the finished pen and prevents it from spreading is punched. After another annealing the blanks are placed between a pair of dies which give them their curved form. Hardening by plunging into hot oil, cleaning in sand and sawdust, and tempering are the next processes. The polishing is performed by placing the pens in revolving barrels of sand or sawdust and then grinding against a revolving emery wheel. The tempering is done by placing the pens in an iron cylinder which is kept revolving over a charcoal fire until they are of the proper temper. This is a delicate process, regulated by the color shown by the pens, which indicates the temperature of the metal. The last and perhaps most important mechanical operation is slitting the pen point. This is done by a specially constructed shearing machine of great delicacy of construction. The pens are now subjected to a final burnishing, and possibly lacquering to prevent rust, and are ready for the market.

Gold Pens. Though steel pens are used in greater quantities than any other kind, there is an increasing demand for gold pens on account of their greater flexibility and durability and especially for their use in fountain pens, to which they are essential. Gold pens were first made in 1825 in England. In the United States their manufacture was first attempted by a watchmaker of Detroit in 1835. In 1840 the business was moved to New York, various improvements were introduced, and the manufacture grew in importance. At first the points of gold pens were protected by diamonds or rubies. The discovery that the native alloy of iridium and osmium could be used much more cheaply as well as satisfactorily was made by John Isaac Hawkins, an American residing in England. The American right to this discovery was purchased by a New York establishment. About 1850 it was discovered that by embedding the iridium points in the gold instead of soldering them on a stronger pen was produced. Gold pens are made in a manner similar to steel pens. The fine gold is alloyed with silver and copper in the proportion of 233½ parts of gold to 92 of silver and 76 of copper. The 14-carat metal in the form of blocks is rolled into thin sheets and the blanks are stamped and shaped with dies. The underside of the point is notched with a circular saw to receive the iridium tip, which is secured by a blowpipe. The slit is cut through the solid iridium by means of a thin copper wheel. The pen is now finished by grinding the points under a microscope, setting the nibs.

Fountain Pens. A fountain pen is one having an ink barrel in the holder which supplies ink as required by means of an automatic feed. Fountain pens were manufactured in England as early as 1835, but they did not attain any great degree of success. In the Schaeffer pen the ink was admitted to the pen from a reservoir in the holder by pressing a projecting

button with the thumb. In the Parker pen the flow of ink was regulated by a piston controlled by a rotating nut. Other early attempts sought to control the flow from the barrel by means of tubes, springs, valves, or other mechanical contrivances. In all these early attempts the flow of ink was found to be irregular. In 1884 a patent was granted to L. E. Waterman for an automatic underfeed pen where there is a groove in the surface of a small rubber bar with three fine slits at its bottom. Modern fountain pens are based on this principle. The flow of ink is usually regulated by a feed, and air is admitted to the barrel to take the place of the ink as it is used. A typical fountain pen consists of four pieces of hard rubber and a gold pen. The handle containing the ink reservoir is in two pieces, connected with a screw joint, so that it may readily be taken apart for filling. The gold pen is held in the point section of the barrel by means of a third piece of rubber, the feed bar, which also conveys the ink from the reservoir to the pen. Air is admitted to the barrel, to replace the ink as it is used, by means of a cavity in the feed connecting with the hole at the end of the slit in the back of the pen proper. During the act of writing the ink is drawn from the reservoir by capillary attraction, through the feed to the pen point, and the flow ceases with the writing. The fourth piece of rubber is the cap, which covers the pen to protect it from injury and keep the ink from drying when not in use. Self-filling fountain pens of various designs are now extensively used, as well as those with screw or other tight-fitting caps which render impossible leakage irrespective of the position in which the pen is carried. In the self-filling pen some form of piston or suction draws up the ink into the barrel from an ordinary inkwell without unscrewing the end carrying the pen. A fountain pen usually holds ink enough for 10 hours or more of continuous writing, or from 15,000 words up, according to the size of the barrel.

Stylographic Pens, like fountain pens, have a reservoir to hold the ink, but instead of an ordinary pen point they have a pencil-shaped point; the point is tubular and in it plays a needle which releases the ink when pressed on the paper. This form of pen is useful with carbon paper for manifolding.

Statistics. According to the Thirteenth United States Census there were in the United States, in 1909, 50 establishments devoted to the manufacture of fountain and stylographic pens, while 15 made gold pens and 5 made steel pens. The capital invested in establishments making fountain, stylographic, and gold pens is given as \$3,120,971, and the value of the annual product \$4,738,693. In 1913 one American company had an output of 2,500,000 pens, valued at between \$8,000,000 and \$10,000,000, of which over 300,000 were exported, and the entire annual production of the United States is estimated at between 7,000,000 and 8,000,000 pens. In the steel and other metallic pens industry in 1909 there were five establishments having a total capital of \$803,783, manufacturing a product valued at \$576,696. The United States is credited with an annual production of some 2,500,000 gross in the world's output of between ten and twelve million gross.

where is published an article entitled "Pens and Pencils"; and for later statistical information *The Thirteenth Census*, vol. viii, "Manufactures" (ib., 1913).

PENA, pá'ná, CARLOS MARÍA DE (1852-). An Uruguayan public official and diplomat. He received the degree of doctor of law and social sciences in 1876 from the University of Montevideo, where later for many years (1885-1911) he was professor of political economy and administrative law and for several years dean of the School of Law and Social Sciences. In 1889-90 he was mayor of Montevideo. Afterward at various times he served as Secretary of the Treasury and as Minister of Public Works, Industry, and Public Instruction in the national government and in various other capacities at home; was special and confidential envoy to Brazil in 1907, a delegate to the Pan-American Conference at Buenos Aires in 1911, and after 1911 Uruguayan Minister to the United States. He is author of a number of volumes on the education, commerce, and industry of Uruguay.

PEÑAFORTE, RAYMOND OF. See RAYMOND OF PEÑAFORTE.

PENAL CODE. A systematic collection and arrangement of the laws of a state or country relating to crimes and their punishment embodied in a single legislative act. By this means the various wrongful acts and omissions which constitute crimes, the degrees of crime, and the penalty imposed for each are all defined and set forth in an orderly manner. Nearly all of the nations of Europe and several of the United States have thus embodied their criminal laws in the convenient and comparatively simple form of a penal code. Some States, including New York, have also adopted a code of criminal procedure which, as its name indicates, provides the mode of enforcing the law as set forth in the penal code. See CODE, and the authorities there referred to.

PENAL LAW. See CRIMINAL LAW.

PENAL TRANSPORTATION. See TRANSPORTATION, PENAL.

PEN'ALTY (Fr. *pénalité*, from ML. *pœnalitas*, punishment, from Lat. *pœnalis*, relating to punishment, from *pœna*, punishment, from Gk. *ποινή*, *poine*, fine, punishment; connected with *rivein*, *tinein*, Skt. *ci*, to avenge). In the most general sense, punishment of any kind for violations of law or legal duty, as the death penalty. Specifically, however, the term is in English and American law more commonly employed to denote a money payment required by law, as a punishment for an offense or for omission to comply with some statutory duty. In this sense a penalty is usually imposed for a violation of the law less serious in its nature than a crime. For example, a neglect to conform to sanitary regulations generally subjects the offender to payment of a sum of money imposed as a penalty, which is considered as commensurate with the gravity of the offense. A penalty differs but little from a fine in its nature and purposes. As penalties are commonly imposed for the less serious violations of the law, which are, for that reason, not so likely to come to the attention of the public authorities, the statutes creating them often provide, as an inducement to persons to inform on offenders, that the whole or a part of the penalty shall go to the informer. In some jurisdictions the informer may recover the amount of the penalty by civil action, and in others payment to the public officials is enforced

by the alternative of imprisonment, and the amount collected is then paid to the informer.

In the law of contracts the term "penalty" is applied to an arbitrary sum fixed by the parties to an agreement, to be paid by the one guilty of a breach thereof. As the civil (as distinguished from the criminal) law is averse to the infliction of forfeitures and penalties, this practice is no longer sanctioned, and a sum fixed as a penalty cannot be recovered by legal action. Where, however, a sum so agreed upon is based on a calculation as to the probable amount of damages in case of a breach, it will be considered as liquidated damages and not as a penalty, and payment enforced.

PEN'ANCE (OF. *penance, penance, penance*, from Lat. *pœnitentia*, repentance, from *pœnitere*, to repent, frequentative of *pœnire*, *pœnire*, to punish, from *pœna*, punishment). The voluntary or accepted punishment by which a repentant baptized sinner manifests his sorrow for sin and seeks to atone for the sin and to avert the punishment which, even after the guilt has been remitted, may still remain due to the offense. Roman Catholics number penance among the seven sacraments (q.v.), and believe it to be of direct divine institution. (Matt. xvi. 19, xviii. 18; John xx. 22, 23.) The matter of this sacrament consists, in their view, of the three acts of the penitent—contrition, or heartfelt sorrow for sin as being an offense against God; confession, or detailed accusation of one's self to a priest approved for the purpose; and satisfaction, or the acceptance and accomplishment of certain penitential works in atonement of the sin confessed; and the form of the sacrament is the sentence of absolution from sin pronounced by the priest who has received the confession and has been satisfied of the penitential disposition of the self-accusing sinner. Even in the apostolic times the practice prevailed of excluding persons of scandalous life from Christian fellowship (see EXCOMMUNICATION), and without attempting to fix the date, it may be stated as certain, from the authority of Tertullian (*De Pœnitentiâ*) and other writers, that from a very early time the persons so excluded were subjected to certain penitential regulations. The class of offenders so treated were those who had been notoriously guilty of the grievous crimes of idolatry or apostasy, murder, adultery, and other scandalous offenses. The period of penitential probation differed in different times and places, but in general was graduated according to the enormity of the sin, some going so far in their rigor (see NOVATION) as, contrary to the clearly expressed sense of the Church, to carry it even beyond the grave. The penitent, in ordinary cases, could only be restored to communion by the bishop who had excluded him, and this only at the expiration of the appointed time, unless the bishop himself had shortened it; but in case of dangerous illness he might be restored, with the condition, however, that if he recovered from the illness the whole course of penance should be completed. The reconciliation of penitents took place commonly in Holy Week, and was publicly performed by the bishop in the church, with prayer and imposition of hands. It was followed by the administration of communion. This public discipline continued in force with greater or less exactness in the fifth, sixth, and seventh centuries, gradually, however, being replaced by semipublic and ultimately by private penance.

In the eleventh and twelfth centuries the public penance had entirely disappeared. The nature and origin of private penance are subjects of controversy between Catholics and Protestants, the former contending that it had existed from the first and that it held the same place even in the ages of public penance for secret sins which the public penance did for public offenses. At all events, from the date of the cessation of the public discipline it has existed universally in the Roman Catholic church. The priest, in absolving the penitent, imposes upon him the obligation of reciting certain prayers, undergoing certain works of mortification, or performing certain devotional exercises. These acts of the penitent are held to form an integral part of the sacrament of penance.

Outside of what is explained above as sacramental penance, devout Roman Catholics have always believed in the infliction of voluntary mortifications as being pleasing to God, since they are based on an intense detestation of sin and realization of its enormity; and many of the saints have gone to almost incredible lengths in seeking suffering as a means of purifying the soul and uniting it more closely with God.

Luther fought stoutly against the doctrine of penance current in his day as being contrary to some of what he considered the most essential principles of scriptural Christianity, particularly to the doctrine of justification by faith in Jesus Christ alone, on the ground of his complete or finished work; penance being founded on a doctrine of at least supplementary atonement by the works or sufferings of man—the sinner—himself. His teaching has been generally followed by Protestants. The outward expressions of humiliation, sorrow, and repentance common under the Jewish dispensation are regarded as very consistent with the character of that dispensation, in which so many symbols were employed. It is also held that the self-inflicted austerities, as fasting, sackcloth and ashes, etc., of Jewish and earliest Christian times, had for their sole purpose the mortification of unholy lusts and sinful passions in the people of God, or the expression of sorrow for sin, so that others beholding might be warned of its evil and restrained from it. Accordingly, in the discipline of the Protestant churches penance is now unknown. The nearest approach to the Roman Catholic polity on the subject was that in use among the English Puritans of the seventeenth century, and more particularly in the Church of Scotland during that and the succeeding century, when it was common "to make satisfaction publicly on the stool of repentance"; but this was never considered as in any way a sacrament. Consult: J. Arndt, *True Christianity: A Treatise on Sincere Repentance* (Philadelphia, 1868); G. Gerhard, *Eucharistic und Bussakrament in den ersten sechs Jahrhunderten der Kirche* (Freiburg, 1908); T. W. Drury, *Repentance and Absolution* (New York, 1903). See ABSOLUTION; CONFESSION; INDULGENCE.

PEN-AND-INK FISH. See CALAMARY.

PENANG, pē-nāng' (Betel-Nut Island). The most northerly division of the British colony of the Straits Settlements. It consists of Penang Island (called also Prince of Wales Island), Province Wellesley, and the Dindings Territory, the total area being stated at 571 square miles. Penang Island, separated by a strait from 2 to 10 miles wide from the west coast of the Malay

Peninsula, is about 15 miles long and 9 miles broad, having an area of 108 square miles (Map: Burma, C 5); it is largely covered by jungle. The chief town is Georgetown (sometimes called Penang), in the northeastern part of Penang Island, in lat. 2° 10' N. and long. 100° 21' E. Next to Singapore, Georgetown is the chief port of the Straits Settlements; it has a capacious harbor and is defended by forts.

Province Wellesley is opposite the island, on the mainland, extending from the Muda River south 45 miles to a point 10 miles below the Krian River and embracing an area of 280 square miles. At the south it touches Perak, but otherwise its landward limits march with Kedah. The Dindings Territory comprises the island of Pangkor (crossed by the parallel 4° 15' N.), some smaller islands, and a strip of territory (bounded by Perak) on the opposite mainland, the total area being stated at about 183 square miles. The chief town of the Dindings is Lumut, on the mainland, which has a fine harbor with deep anchorage.

The climate is uniform. In 1913 the mean temperature in Penang was 82.2° and in Province Wellesley 81.9°. The rainfall in Penang in 1912 was 120 inches, in Province Wellesley 106 inches, and in the Dindings 73 inches. The principal produce for export comes from Province Wellesley and consists of tapioca, rice, rubber, and sugar. Penang is the chief centre for the trade of northern Sumatra and the Malay Peninsula. Its aggregate trade in 1913 (including inter-settlement trade) amounted to 271,041,222 Straits Settlements dollars (the Straits Settlements dollar = \$0.5677 United States money); the export of tin from Georgetown was valued at 57,070,228 dollars. A railway, 23 miles long, connects Prai, in Province Wellesley, with the Perak system. The population of the settlement of Penang was 235,618 in 1891, 248,207 in 1901, and 278,003 in 1911, mostly Malays and Chinese; estimate for 1914, 287,935 (Asiatics, 176,057 males, 108,735 females; Eurasians, 981 and 800; Europeans and Americans, 488 and 239). In 1901 the population of Penang Island was 128,830, and of Georgetown municipality 94,086; in 1911 Penang Island had 141,559 inhabitants, Province Wellesley 128,978, and the Dindings 7466.

Penang was the first British settlement in the Malay Peninsula. The island was ceded by the Rajah of Kedah to the East India Company in 1786. On account of the prevalence of piracy, in 1800 a strip of mainland coast was acquired, now (having been enlarged) known as Province Wellesley. Pangkor and smaller islands were ceded by Perak in 1826 (also to facilitate the suppression of piracy), and the mainland portion of the present Dindings Territory in 1874. In 1805 Penang was made a presidency of equal rank with Bombay and Madras. In 1826 Singapore and Malacca were incorporated with Penang; Georgetown continued as the seat of government until 1836, which in that year was transferred to Singapore. See STRAITS SETTLEMENTS.

PEN ARGYL, pên ār'jil. A borough in Northampton Co., Pa., 18 miles by rail north of Easton, on the Bangor and Portland and the Lehigh and New England railroads (Map: Pennsylvania, L 5). There are slate quarries and, among the industrial establishments, a shoe factory and a planing mill. Pop., 1900, 2784; 1910, 3967.

PENARTH, pên-arth'. A seaport and urban district of Glamorganshire, Wales, at the mouth of the Taff, opposite Cardiff (Map: Wales, C 5). It is a favorite seaside residence and bathing resort of the Cardiffians. It was an unimportant village until 1856, when its port was made a tidal harbor. It has a large dock covering 23 acres and is an important shipping port for the minerals of South Wales, especially coal, iron, and alabaster. The docks have 6125 feet of quayage and the tidal harbor 15,000 feet. The town maintains public baths, parks, and pleasure grounds and an isolation hospital. Pop., 1901, 14,200; 1911, 15,488.

PENATES, pē-nā'tēz (Lat. nom. pl., gods of the storeroom). The Roman gods of the storeroom, worshiped, with Vesta, at every hearth. The proper title is *di penates*, which indicates that a group of gods is here united under a comprehensive title, which is not really a proper name. It thus follows that the individual deities comprised in the title might vary in different families, and this seems proved by the variety of gods who appeared grouped with Lares and Genius as penates in the Pompeian paintings near the hearth. Vesta seems usually, if not always, included in these groups. Each family worshiped its own penates, though under the Empire the penates of the Imperial family were publicly honored. As the family had its private hearth, so the state had its temple of Vesta also, and with her were naturally worshiped the public penates, probably a collective title for the gods who cared for the prosperity of the state. Later (before 167 B.C., probably by some considerable time) a little temple of the penates was built on the Velia, a part of the Palatine Hill, towards the Forum, and now images after the type of the Greek Dioscuri were set up. Varro, it is true, denied that these were the true penates, whose sacred symbols were rather kept secretly in the *cellae Vestae*; but other antiquaries did not follow him, and much ingenuity was displayed in attempted explanation of these mysterious gods. They were identified with the great gods of Samothrace, and after the time of Augustus it was the orthodox belief that they had been brought from Troy to Italy by Aeneas. See LARES; MANES. Consult W. W. Fowler, *The Religious Experience of the Roman People* (London, 1911), and Georg Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

PEN'CIL (OF. *pinzel*, Fr. *pinceau*, from Lat. *penicillum*, *penicillus*, painter's brush, dim. of *penis*, Gk. *πέος*, *peos*, tail, penis). An instrument for writing or drawing, employing some coloring material of which it is composed, as lead, graphite, or slate. Probably the pencil was the first instrument used by artists and in its earliest form consisted simply of a lump of colored earth or chalk cut into a form convenient to hold in the hand. With such pencils were executed the line drawings of Aridices, the Corinthian, and Telephanes, the Sicyonian, and also the early one-colored pictures or *monochromata* of the Greeks and Egyptians. The use of metallic lead for marking is of very ancient origin. Pliny refers to the use of lead for making lines on papyrus, and Cortés in 1520 found the Aztecs using lead crayons. Black-lead pencils are made of graphite or plumbago, which contains no lead whatever in its composition, but is in reality almost pure carbon. (See GRAPHITE.) The misnomer is probably owing to the

fact that, previous to the employment of graphite for making pencils, common lead was used, a material which, indeed, continued to be employed until well into the nineteenth century. Consequently, since plumbago with its black streak offered a contrast to the pale mark of the lead, it was called, in contradistinction, black lead.

Development of the Industry. The manufacture of graphite pencils in England began in 1564, when a valuable graphite mine was discovered at Barrowdale, Cumberland. The mine was so highly prized that Parliament kept it guarded with an armed force, and, to keep up the value of the product, it was worked only six weeks in the year. The early graphite pencils were made by pulverizing the graphite and compressing it into solid blocks by means of a hydraulic press, and then cutting bars from the blocks. In 1850 the Barrowdale mine became exhausted. Graphite is now mined at Passau, Bavaria; Schwarzbach, Bohemia; in Norway, in New Zealand, in Mexico, and in various parts of the United States. The mine containing the purest graphite yet discovered is located at Ticonderoga, in New York State. It yields a product which is 99.9 per cent pure carbon. (See GRAPHITE.) The manufacture of lead pencils is extensively carried on in Germany, England, and America.

Pencil Manufacture in the United States. The two raw materials essential for pencil manufacture, pure graphite and excellent cedar for the cases, exist in such generous quantities in the United States as to favor exceptionally the growth of this industry. The first manufacturer of black-lead pencils in the United States was William Monroe, of Concord, Mass., who in 1812 invented a process by which he pulverized and mixed the material and incased it in cedar holders. He was very successful in selling his product and continued the business for about 18 months, when he was obliged to give it up on account of the difficulty of obtaining the raw materials. Later he resumed the manufacture of pencils and continued it on a small scale for many years. Another pioneer in the industry was Joseph Dixon, and in 1860 the Fabers established a branch factory in the United States.

Method of Manufacture. The familiar lead pencil of everyday use consists of a round or polygonal stick of graphite mixed with clay, surrounded by a cedar case. The graphite is first reduced to an impalpable powder by grinding. Water is then added and the substance is run through mixers in a fluid state, the proper amount of finely powdered clay being put into the mixture and thoroughly blended with it. A little lampblack is sometimes added to the composition to increase the blackness. The more clay used, the harder will be the pencil. The mixing is performed by specially constructed machinery. After thorough mixing the mass is placed in filter presses to exclude the water and reduce the mixture to a doughy consistency. The material is next passed through dies consisting of successive plates with holes of varying diameter. Great pressure is used, causing the mixture to ooze forth in doughy strings. This process is repeated several times. The final dies are of the same diameter as the finished lead. The graphite in this form is straightened, cut into three-foot lengths, and allowed to dry. It is next cut into pieces of the required length, usually about 7 inches. These pieces are packed

in crucibles and burned for several hours, to extract the moisture. The graphite pieces, or leads, which range from 0.066 to 0.073 inch in diameter, are now ready to be inserted in the wooden cases. Sometimes the plumbago is calcined before being mixed with clay. For some varieties of drawing pencils the leads are immersed for a minute in very hot melted wax or suet before being mounted.

The leads are usually incased in the wood before it is shaped into a pencil. Little slabs of cedar, two, four, or six pencils wide, are passed through a machine which cuts out semicircular grooves the diameter of the pencil. Into the grooves in one of these slabs the leads are laid and another grooved slab is glued to it, thus completely incasing the graphite. The slabs are now passed through machines which divide them into pencils, with their sides shaped in hexagonal or in curved form. After the processes of polishing, varnishing, and stamping, all of which are performed by machinery, the pencils are ready for shipment.

Colored Pencils are made of chalk, clay, or wax, mixed with coloring pigments, the nature of which does not permit their being calcined like black pencils. They may be incased in wood like ordinary pencils, or simply wrapped in paper. A useful form of pencil is the so-called indelible ink or copying pencil where aniline coloring matter mixed with the graphite enables one to make a purplish line, which on being moistened takes a brighter color and may be transferred by ordinary copying methods. Towards the close of the nineteenth century a process was invented by which both black and colored pencils were incased in paper instead of wood. A sheet of paper cut for a part of its width into strips about $\frac{1}{4}$ inch wide is wrapped around the lead to form a case of the usual thickness. The surface is painted. When the pencil point wears down too close to the paper it is sharpened, that is, more lead is exposed, by simply unwinding one of the narrow strips of paper.

Slate Pencils are sometimes inclosed in wood, but are more often little unprotected rods of slate or some form of talc. Partly from sanitary reasons, they are not nearly so much used as formerly, paper and lead pencil having taken for most purposes the place of slate and pencil.

Statistics. According to the Thirteenth Census of the United States (volume on Manufactures, published 1914) there were, in 1909, 11 pencil factories, having a total capital of \$7,867,247, and producing an annual output valued at \$7,378,744. The number of factories reported has increased only three since the census of 1860, but the capital invested was then only \$6,600 and the value of the product about \$20,400. The value of the pencils and pencil leads imported into the United States for the census year 1909 was \$514,697, while in 1914 the imports were valued at \$642,998.

White, "Production of Red Cedar for Pencil Wood," *United States Department of Agriculture, Forest Service Circular 102* (Washington, 1907); also *The Twelfth United States Census*, vol. x, part iv, "Manufactures," which contains historical, descriptive, and statistical matter regarding the pencil industry in the United States (Washington, 1900); while later statistical information on the industry will be found in the *Thirteenth Census of the United States*, vol. viii, "Manufacturers" (ib., 1913).

Consult also the publications of the United States Forestry Service, and various papers in the *American Lumberman* (Chicago, annually).

PENCIL, IN MATHEMATICS. See PERSPECTIVE.

PENCK, pēpk, ALBRECHT (1858-). A German geologist and physical geographer, born and educated at Leipzig (Ph.D., 1878). He made special studies of the mountains of Bavaria and Tirol (1880), and traveled in Europe, Asia, Africa, and America. After serving as docent at Munich he was in 1885 appointed professor of physical geography at Vienna. He was editor of *Geographische Abhandlungen* (1886 et seq.) and a contributor to the *Geological Journal* of Chicago. In 1892 he was appointed president of the central commission for the study of the geography of Germany, and in 1906 became professor of geography at the University at Berlin and director of the museum of oceanography. In 1909 he was exchange professor at Columbia University, New York City. He became a member of the International Polar Commission. Among his many works are: *Die Vergleichen der deutschen Alpen* (1882); *Die Eiszeit in den Pyrenäen* (1884); *Morphologie der Erdoberfläche* (1894); *Die Alpen im Eiszeitalter* (1901-08); he published many maps also.

PENCZ, pēnts, GEORG (c.1500-50). A German painter and engraver. He was born at Nuremberg and was probably a pupil of Dürer or, at least, stood immediately under his influence. He was received into the Painters' Guild in 1523, but in the year following was banished for religious reasons. About 1532 he returned to Nuremberg, where he was frequently employed by the city council. He is supposed to have visited Italy, where he was strongly influenced by the Italian masters and to have perfected himself in engraving under Marc Antonio. Although Pencz is credited as an assistant in the decorations of the Nuremberg Rathaus, his fame as a painter rests chiefly on his masterly portraits, which rank among the finest productions of the Nuremberg school. Especially characteristic are a "Young Man" (1534), "The Painter Erhard Schwetzer" (1544), and his "Wife" (1545), all in the Berlin Museum; a "Young Man" (1543), in the Vienna Museum; "Fieldmarshal Sebaldus Schirmer" (1545), in the Germanic Museum, Nuremberg; and a "Scholar" in the Karlsruhe Gallery. Pencz is most prominent as an engraver, ranking next to the Behans among the Little Masters. His style is clear, but is lacking in grace; his execution is solid and his tendency didactic. Besides his largest plate, "The Taking of Carthage" (1539), after Giulio Romano, may be mentioned the "Six Triumphs of Petrarch," "Life of Christ" (26 plates), "Medea," and the portrait of John Frederick, Elector of Saxony. Consult: W. B. Scott, *The Little Masters* (London, 1879); Albrecht Kurzwelly, *Forschungen zu Georg Pencz* (Leipzig, 1895); E. Waldmann, *Die Nürnberger Kleinmeister* (ib., 1910).

PEN'DA. A king of the Anglo-Saxon Kingdom of Mercia (q.v.).

PEN'DANT (Lat. *pendens*, hanging, pres. p. of *pendere*, to hang). A hanging ornament, used in ceilings, vaults, staircases, timber roofs, as the end of keystones, posts, corbels, etc. It is sometimes a simple ball and sometimes is elaborately ornamented, and used chiefly in the later Gothic and Renaissance styles.

PEND D'OREILLE, pēnd ô-rēl'. See KALISPEL.

PENDENNIS, THE HISTORY OF. A novel by W. M. Thackeray (1850). Arthur Pendennis, the hero, an amiable, commonplace, but thoroughly lifelike young man, becomes in ripper years a successful writer in London, and as such tells the story of *The Newcomes*.

PENDENTIVE. A structure of masonry designed for the support of a domical vault over four or more isolated piers. It may be described as a triangular portion of a spherical surface, bounded by two adjacent half arches and by that part of the base of the dome comprised between them. It is usually employed over four, more rarely over eight, piers or supports connected by arches. Its development by Byzantine architects of the sixth century made it possible to erect domes (see DOME) above interiors of any desired plan, and this made it one of the greatest acquisitions in the history of architecture. By extension, any device for supporting a dome over a polygon or a square is often called pendentive, as in the case of the Mohammedan stalactite pendentive; but it is an inaccurate use of the term to apply it to corbeling or squinches. See BYZANTINE ART.

PEN'DER, HAROLD (1879-). An American electrical engineer, born at Tarboro, N. C. He was educated at Johns Hopkins (A.B., 1898; Ph.D., 1901), was instructor at Syracuse University (1902-03), and spent the winter of 1903 at the Sorbonne. He served as electrical engineer of the Westinghouse Electric and Manufacturing Company (1903-04) and of the New York Central Railroad (1904-05), and then engaged in work in connection with Cary T. Hutchinson and with the McCall Ferry Power Company until 1909. At Massachusetts Institute of Technology he was professor of electrical engineering in 1909-13, and thereafter director of the research division of the institute's department of electrical engineering. Besides editing the *American Electrical Engineering Handbook* (1914), Pender is author of *Principles of Electrical Engineering* (1911).

PENDER, SIR JOHN (1816-96). A British cable pioneer, born in the Vale of Leven, Scotland. He established himself as a textile merchant of Glasgow and Manchester. In 1857 he became a director of the first Atlantic Cable Company; when this company failed he helped to found the Anglo-American Company in 1865; and the next year, when this company was succeeded by the Telegraph Construction and Maintenance Company, he became its chairman and personally guaranteed for it more than \$1,000,000. At the time of his death he possessed a controlling interest in cable companies with a joint capital of nearly \$75,000,000. Pender sat in Parliament in 1865-66, 1872-85, and 1892-96. He received the K.C.M.G. in 1888 and the G.C.M.G. four years later.

PENDLETON, pēn'd'l-ton. A town of Lancashire, England, suburban to Manchester on the northwest. Pendleton is part of the parliamentary borough of Salford and is incorporated with its municipality. It has a large race course. The rapid increase of its population is owing to the immense industries of the locality, which are identified with those of Salford and Manchester (q.v.) and are connected chiefly with cotton and silk manufactures. Pop. 1901, 75,000; 1911, 78,783.

PENDLETON. A town and the county seat

of Umatilla Co., Oreg., 225 miles east of Portland, located on the Umatilla River and on the line of the Oregon Railroad and Navigation Company and the Washington and Columbia River Railroad (Map: Oregon, G 2). Pendleton is the distributing centre of a very productive region interested largely in wheat growing and in the raising of cattle, hogs, sheep, and horses; it has flour mills, woolen and wool-scouring mills, machine shops, etc. Some of these establishments are operated by water power supplied by the river, which is here crossed by four substantial bridges. The chief buildings are a fine courthouse, a Carnegie library, high and grade schools, a State hospital for the insane, and a Federal building. The Pendleton "Roundup" is an annual frontier festival and exhibition which attracts thousands of visitors. Pop., 1900, 4406; 1910, 4460.

PENDLETON, EDMUND (1721-1803). An American statesman of the Revolutionary period. He was born in Caroline Co., Va., and was wholly self-educated. In 1744 he was admitted to the bar and in 1752 was elected to the House of Burgesses, of which he was a member for many years, serving several terms as Speaker. He was a member of the Committee of Correspondence in 1773; was a delegate to the First Continental Congress (1774); and was president of the Virginia conventions of 1775 and 1776. The resolution of May, 1776, instructing the State delegates to introduce a declaration of independence in Congress, was written by him. In 1776 he became president of the Committee of Safety, and, on the organization of the State government, was elected Speaker of the House of Burgesses and, somewhat later, president of the Court of Chancery. In 1777 he became crippled for life, but continued to serve as Speaker of the House, and in 1779 became president of the Court of Appeals, which position he held until his death. In 1788 he presided over the Virginia convention which ratified the Federal Constitution, he himself taking an active part in the debate and being largely responsible for the final decision.

PENDLETON, ELLEN FITZ (1864-). An American college president. She was born at Westerly, R. I., and was educated at Wellesley College (A.B., 1886; A.M., 1891) and at Newnham College, Cambridge (1889-90). At the former institution she served as tutor in mathematics (1886-88), instructor (1888-97), secretary (1897-1901), dean and associate professor of mathematics (1901-11), and thenceforth as president. Miss Pendleton received the honorary degree of Litt.D. from Brown University in 1911 and that of LL.D. from Mount Holyoke College in 1912.

PENDLETON, GEORGE HUNT (1825-89). An American lawyer, legislator, and civil-service reformer, born in Cincinnati, Ohio, July 25, 1825. He studied law, was admitted to the bar in Ohio, and became distinguished in his profession. He was a member of the State Senate in 1854-55, was elected to Congress in 1856, and served successively in the Thirty-fifth, Thirty-sixth, Thirty-seventh, and Thirty-eighth Congresses, being a member of the House Committee on Military Affairs during the first three terms and a member of the Ways and Means Committee during the last term. He identified himself with the Anti-War Democrats and attracted much public criticism on account of the boldness of his antagonism to the course of the

administration. In 1864 he was nominated for the vice-presidency of the United States on the ticket with General McClellan. As a candidate, however, he felt compelled to write an open letter avowing that he personally favored no terms of peace that would involve a final rupture. Pendleton was one of the most prominent leaders of the Greenback party, strongly opposing the payment of the government bonds in gold and the contraction of the currency. In 1879 he was elected to the United States Senate, where he won distinction as chairman of the Committee on Civil-Service Reform. Late in 1882 he introduced in the Senate the so-called Pendleton Bill for reforming the civil service. This bill passed the Senate on December 27 and the House on Jan. 5, 1883, and was approved by President Arthur on January 16. It marks the first definite establishment of the merit system as opposed to the spoils system in the United States. (See CIVIL-SERVICE REFORM.) At the expiration of his term as United States Senator, in 1885, he was appointed by President Cleveland Minister to Germany, which post he held until his death, at Brussels, Nov. 24, 1889.

PENDULUM (Neo-Lat. neut. sing. of Lat. *pendulus*, hanging down, from *pendere*, to hang). A pendulum is any rigid body mounted on a horizontal axis so that it can swing to and fro, making vibrations under the influence of gravity. A "simple" pendulum is the name given an imaginary pendulum consisting of a particle of matter suspended from a point by a cord supposed to be without mass. If the length of this cord is l and if g is the acceleration which the suspended particle would have if allowed to fall freely towards the earth, the period, or time taken for one complete vibration of the simple pendulum swinging in a vertical plane through very small arcs, is $2\pi \sqrt{\frac{l}{g}}$. The period of any actual or "compound" pendulum is given by the formula $2\pi \sqrt{\frac{I}{mgl}}$ where I is the moment of inertia of the pendulum about its axis of suspension, m is its mass, l is the distance from the centre of gravity to the axis, and g has its usual value. It is seen that the period of vibration of a pendulum is constant, being independent of the extent of the amplitude of vibration, provided only that it be small compared with l . This fact was made use of by Galileo, who also recognized the connection between the period and the length of a pendulum.

The length of the pendulum, as will be seen from the formula, varies as the square of the time of oscillation, and consequently a pendulum with a vibration period of one-half second has but one-quarter the length of a seconds pendulum. It is apparent also that pendulums of different kinds of matter, but in other respects identical, should have the same periods of vibration if g is the same for the different kinds of matter. This idea was tested by Newton and later by Bessel, who found that within experimental limits g is the same for all forms and kinds of matter. If g is different at different places on the earth, the fact will be shown by measuring the period of the same pendulum at these places. The variation of the force of gravity at different places on the earth's surface was first discovered by Richter in 1672.

The problem of deducing the length of a simple pendulum which should have the same period as a given compound pendulum was first solved

by Huygens. See CENTRE OF OSCILLATION; MECHANICS.

If the same pendulum is swung at various positions on the earth's surface, its time of vibration will vary, depending on the value of g . Accordingly one of the best methods of determining this quantity is to cause a pendulum to swing at different stations and carefully and exactly measure its time of oscillation. In the United States this work is done by the United States Coast and Geodetic Survey, and from their observations the value of the absolute force of gravity in the pendulum room of the Coast and Geodetic Survey at Washington has been found to be 980.112 dynes on the C.G.S. system. The relative measure between Washington and Potsdam, Germany, where an absolute determination has been made, gave this value, which was duly adopted.

The pendulums used in the United States Coast and Geodetic Survey for gravity determinations are about one-quarter of a meter long and swing with a period of one-half second in a case from which the air has been exhausted. The simple stem and a lenticular bob are of solid brass cast in one piece, the pendulum being supported on agate bearings. A beam of light is thrown into the pendulum case every second, and when the pendulum is vertical it is reflected into a telescope through the coincidence of two slits. A carefully rated chronometer, whose error is known to within a few hundredths of a second at the beginning and end of a series of observations, forms a part of

HALF-SECOND PENDULUM.

Front and side views of United States Coast and Geodetic Survey standard form. A, handle for lifting pendulum from the knife edges on which it is suspended.

the apparatus and enables the observer to determine with great accuracy the time of vibration of the pendulum. The chronometer is rated either from astronomical observations or by the noon signals sent from Washington over the commercial telegraph lines. The instruments of the Survey are extremely portable, and the observers travel from station to station making observations.

The intensity of the force of gravity is measured so that the probable error will not exceed one part in 200,000, and an actual error of this amount corresponds to an error of $\frac{1}{1000000}$ of a second in the time of oscillation of the pendulum. Numerous corrections are applied in making the observations, including allowance for the movement of the containing case, by means of the interferometer, such minute distances as the $\frac{1}{1000000}$ of an inch being readily measured. The variation in time of oscillation at three stations in North America, with considerable difference in their latitude, naturally is shown in the corresponding values of gravity. From such pendulum observations the observed

gravity in Washington is 980.112, at Key West, Fla., 978.970, and at Eagle City, Alaska, 982.183.

Another application of the pendulum, due to Foucault, is to show the rotation of the earth. Using a long pendulum with a heavy weight, he found that the plane of oscillation would shift in the same direction as the motion of the sun, or opposite to the rotation of the earth. Were the pendulum to vibrate at the pole, it would continue in the same plane as the earth rotated, the path of the pendulum appearing to make one complete revolution in 24 hours. At the equator, on the other hand, there would be no rotation of the plane of vibration.

In order to determine the length of a seconds pendulum at any particular place the method devised by Captain Kater of using a reversible pendulum is employed. Here the centre of oscillation and the centre of suspension are interchangeable, and the apparatus will be equivalent to a simple pendulum, whose length is the distance between them. In practice these two points are formed by knife edges, which can be moved with respect to each other along a rod, so that the vibrations of the pendulum will be synchronous irrespective of the knife edge by which it is supported. Such reversible pendulums were used for measuring the absolute value of gravity, a proceeding requiring the greatest care and a large number of observations.

Compensation Pendulum. As the length of a rod or bar of any material depends on its temperature (see HEAT), a clock with an ordinary or uncompensated pendulum goes faster in cold weather on account of contraction and slower in hot weather, due to expansion. In the method of correction usually employed, and called *compensation*, advantage is taken of the fact that different substances have different coefficients of linear expansion, so that if the bob of the pendulum is so suspended as to be raised by the expansion of one substance, and depressed by the expansion of another, the lengths of the effective portions of these substances may be so adjusted that the raising and depression, taking place simultaneously, may leave the position of the bob unaffected. There are two common methods of effecting this, differing a little in construction, but ultimately depending on the same principle. Of these, the *mercurial pendulum*, originally due to Graham, is the more easily described. The rod AC and the framework CB are of steel. Inside the framework is placed a cylindrical glass jar, nearly full of mercury, which can be raised or depressed by turning a screw. With an increase of temperature the steel portion AC is lengthened by an amount proportioned to its length, its coefficient of linear expansion, and the change of temperature conjointly, and thus the jar of mercury is removed from the axis of suspension. But neglecting the expansion of the glass, which is very small, the mercury rises in the jar by an

MERCURIAL COMPENSATING PENDULUM.

amount proportional to its bulk, its coefficient of cubical expansion, and the change of temperature conjointly. Now, by increasing or diminishing the quantity of mercury, it is obvious that we may so adjust the instrument that the length of the equivalent simple pendulum shall be unaltered by the change of temperature, whatever be its amount, so long as it is not great enough to change sensibly the coefficients of dilatation of the two metals.

The construction of the *gridiron* pendulum will be easily understood from the cut. The shaded bars are steel; the second and fourth ones are zinc, or some substance whose coefficient of linear expansion is considerably greater than that of steel. It is obvious from the figure that

the horizontal bars are merely connectors, and that their expansion has nothing to do with the vibration of the pendulum, so they may be made of any substance. It is easily seen that an increase of temperature lowers the bob by expanding the steel rods, whose effective length consists of the sum of the lengths of one of the outer rods and the steel bar to which the bob is attached; while it raises the bob by expanding the zinc bars, the effective length of which is that of one of them only; the other, as well as one of the outside steel rods, being added to the instrument for the sake of symmetry, strength, and stiffness only. If the effective lengths of steel and brass be inversely as their respective expansion coefficients, the position of the bob is unaltered by temperature; and therefore the pendulum will always vibrate in the same period. This is on the supposition that the weight of the framework may be neglected in comparison with that of the bob; if this weight must be taken into account, the requisite adjustments, though possible, are greatly more complex and can only be alluded to here. Instead of the *gridiron* arrangement it is possible to employ a centre rod of steel sur-

rounded by a tube of zinc and that in turn by a tube of steel with a lead bob, the combined lengths being as 34 for the steel to 14 for the zinc and lead. Practically it is found that a strip of dry fir wood, carefully varnished to prevent the absorption of moisture, and consequent hygrometric alterations of its length, is very little affected by change of temperature; and in many excellent clocks this is used with a lead or zinc bob as an effective substitute for the more elaborate forms just described.

In astronomical clocks, though they are kept at a temperature as nearly uniform as possible, the compensation of the pendulum is a matter of delicacy, and the calculations involved in their design so as to secure the proper amounts of materials are often most minute. Perhaps the most successful attempt to realize a compensating pendulum is found in the *Riefler* pendulum, a combination of the mercurial and metallic pendulums, which has found application for astronomical clocks and timekeepers of high precision, such as are found at national observa-

tories and in physical institutes like the United States Bureau of Standards. This pendulum consists of a steel tube of about 16 millimeters' bore and 1 millimeter thick, filled two-thirds of its length with mercury. It has a metal bob several kilograms in weight, so shaped as to cut the air, and below the bob are adjustable disk-shaped weights for correcting the compensation. This pendulum is said to be correct to ± 0.005 seconds a day with a $\pm 1^\circ$ variation in temperature. After the invention of *Invar* (q.v.) and its utilization, about 1900, it was found available for use as a pendulum rod on account of its very low coefficient of expansion. This use of the new nickel-steel alloy was investigated by its inventor, C. E. Guillaume, and it was demonstrated as a cheap and good arrangement available for many clocks of precision.

Garrard, *Clock Repairing and Making* (London, 1914); also the *Journal Suisse d'Horlogerie* (Geneva); *Physical Review* (Ithaca); and most of the larger manuals on physics and mechanics. For the use of the one-half second pendulum in gravity determinations, consult: *United States Coast and Geodetic Survey, Annual Report, 1894*, Appendix 1 (Washington, 1895); G. R. Putnam, in *Coast and Geodetic Survey, Annual Report, 1901*, Appendix 5 (ib., 1902); W. H. Burger, "Method of Determining Flexure of the Pendulum Case by Use of an Interferometer," in *United States Coast and Geodetic Survey, Annual Report, 1910*, Appendix 6 (ib., 1911). The determination of the intensity of gravity throughout the United States will be found discussed in the same *Survey, Special Publications*, Nos. 10 and 12 for 1912, particularly in the latter, where is given a table of principal facts for 124 gravity stations in the United States, including the computed and observed gravity at each station. See MECHANICS.

PENELOPE, pē-nēl'ō-pē (Lat., from Gk. Πηνελόπη, *Pēnelopē*, Πηνελόπεια, *Pēnelopeia*). In Greek legend, a daughter of Icarios of Sparta and Peribœa and wife of Odysseus. According to the Homeric story Odysseus was soon called to the Trojan War, leaving his wife with their infant son Telemachus at Ithaca. When Troy had fallen and years passed without his return, numerous suitors gathered at his palace, whom the youthful Telemachus could not dispossess, though they devoured and wasted his father's goods, while importuning Penelope to choose one of them as her husband. For some time she put them off under the plea that she must first finish the shroud she was weaving for old Laertes, father of Odysseus. To protract the time, she raveled out at night what she wove by day. Betrayed by a maid, she was compelled to finish the work, and the suitors were preparing to force a decision, when Odysseus returned and slew them. Later epics told how Odysseus was subsequently slain in ignorance by Telegonus, his son by Circe, and how after his death Telemachus, Telegonus, and Penelope journeyed to Circe's island, where Telemachus wedded Circe, and Telegonus Penelope. There is considerable evidence connecting both Odysseus and

Penelope with Arcadia, as local divinities. At Mantinea the grave of Penelope was shown, and in Arcadian legends she is a nymph, who became by Hermes (or in another version by all the suitors) the mother of Pan. The later writers endeavored to account for her grave by saying that when Odysseus learned of her infidelity he dismissed her, whereupon she wandered to Lacedæmon and then to Mantinea, where she died.

PENEPLAIN, pē'né-plān'. See PLAIN.

PEN'ETAN'GUISHENE'. A town and summer resort in Simcoe Co., Ontario, Canada, on an inlet of Georgian Bay and on the Grand Trunk Railway (Map: Ontario, E 4). It has a Carnegie library, a hospital for the insane, and two parks. Its industries include the manufacture of leather, lumber, launch engines, boxes, carriages, foundry and machine-shop products, stoves, boats, canoes, fibre boards, shoe packs, sashes and doors, and bricks. Pop., 1901, 2422; 1911, 3568.

PEN'ETRA'TION OF A PROJECTILE.

See BALLISTICS.

PEN'FIELD, EDWARD (1866-). An American illustrator, designer, and painter. He was born in New York, where he studied at the Art Students' League, afterward working in Holland and England. He was associated with the Harpers, publishers, from 1891 until 1901, and designed many posters, magazine covers, and calendars for them as well as for various industrial concerns. He was one of the first in America to make poster designs in color, in which medium he showed himself to be an artist of originality and unusual force. His work is distinguished by simplicity, directness, and a wholesome humor, and, though unconventional, is without extravagance. His paintings include decorations in Randolph Hall, Cambridge, Mass., and in the Rochester Country Club. He is the author and illustrator of *Holland Sketches* (1907) and *Spanish Sketches* (1911).

PENFIELD, FREDERIC COURTLAND (1855-). An American diplomat, born in Connecticut. He was graduated from Russell's Military School at New Haven, Conn., studied in Germany, and engaged in journalism. In 1885 he received the appointment of Vice Consul General at London and in 1893-97 served as diplomatic agent and Consul General in Egypt. In 1913 President Wilson appointed him Ambassador to Austria-Hungary. He received various decorations from foreign governments, also the honorary degree of A.M. from Princeton in 1907. Both he and his wife, who established a hospital in Vienna, were active in relief work in behalf of Austrian soldiers during the European War. Besides frequent contributions to periodicals on diplomacy and international law, Penfield is author of *Present Day Egypt* (1899; rev. ed., 1903) and *East of Suez* (1907).

PENFIELD, SAMUEL LEWIS (1856-1906). An American mineralogist, born at Catskill, N. Y. He was graduated in 1877 at the Sheffield Scientific School of Yale and was appointed professor of mineralogy there. Penfield was elected to the National Academy of Sciences. His publications include: *Determinative Mineralogy and Blow-Pipe Analysis* (1898); *Tables of Minerals* (1903; 2d ed., 1907); and contributions to the *American Journal of Science and Art* on crystallography and mineralogy.

PENFIELD, WILLIAM LAWRENCE (1846-1909). An American jurist and international

lawyer, born at Dover, Mich. He was graduated at the University of Michigan in 1870, taught at Adrian College, and was admitted to the bar in 1872. The next year he settled at Auburn, Ind., was elected city attorney, and became prominent in Republican politics, in 1892 being a delegate to the Republican National Convention. From 1894 to 1897 he was judge of the circuit of Indiana. During the next eight years, while solicitor of the Department of State under appointment of Presidents McKinley and Roosevelt, Penfield came to be recognized as a foremost authority in international law. He was counsel for the United States in arbitrations between that country and Santo Domingo, Peru, Haiti, Nicaragua, Salvador, and Mexico, securing for the United States awards amounting to \$2,500,000. Also, in 1902, he represented the United States against Mexico in a case concerning the famous Pious Fund for the Californias, the first case tried before The Hague Tribunal. He was also counsel for both the United States and Venezuela in the preferential treatment case before The Hague Tribunal in 1903.

PENGE, pēnj. A municipality of Surrey, England, and a residential suburb of London, 7 miles southeast of St. Paul's. Pop., 1901, 22,460; 1911, 22,230.

PEN'GUIN (possibly from Welsh *pen gwen*, white head, applied to the auk and later transferred to the penguin, or perhaps from a native South American name). One of the Antarctic sea birds of the family Spheniscidae, representing the larger group Sphenisci. They have short wings, quite unfit for flight, but covered with short rigid scalelike feathers and much like the flippers of turtles. The legs are very short and are placed very far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and they thus maintain a perfectly erect posture. Their bones, unlike those of birds in general, are hard, compact, and heavy and have no air cavities; those of the extremities contain an oily marrow. The body is of an elliptical form; the neck of moderate length; the head small; the bill moderately long, straight, more or less compressed; the tail very short. They are among the most aquatic birds and spend little more time on shore than is necessary for sleeping and reproduction. Their food consists of the small creatures of the sea, which they catch by swimming and diving, often to great depths. The wings are modified internally as well as externally to make them effective aids in this work and are used together like oars, as other birds swim under water or fly in the air, so that continuous and rapid progress is made without the aid of the feet, which serve merely as rudders. Under their skin is a layer of blubber-like fat, which assists them to withstand the icy air and water of their habitat. They go about in swimming "schools" and gather at their breeding grounds in enormous flocks.

About 15 species are known, mainly in high southern latitudes, although some species straggle as far north as Peru and Brazil, New Zealand, and the Cape of Good Hope. It is upon the islands about Cape Horn and in the Antarctic Sea that they abound and breed in the greatest numbers. The life of the birds in these colonies is of the greatest interest, and their habits and interrelations are among the most remarkable to be found in ornithological history.

Some gather stones, bits of stick, grass, etc., into a sort of nest; others make no nest whatever; while the king penguin, and perhaps some others, incubate the egg by holding it between their thighs, resting on the top of their feet, the male and female relieving each other at intervals. A single egg only is laid, but it is tended and guarded with great care; and the mother penguin is said to keep her young one with her for a twelvemonth.

The king penguins (*Aptenodytes*) are the largest among the species. They stand 3 feet high and are grayish blue with black heads, white breasts, and orange or yellow throats. They exist in colonies of many thousands. The jackass penguins (*Spheniscus*) are medium-sized or small species with a stout bill. They receive their popular name from their cry. The rock hoppers or macaronis (*Eudyptes*) are notable for being curiously crested with curly yellow plumes on each side of the head. The smallest known species of penguin is *Eudyptula minor* of Australia and New Zealand, which is only about a foot long. In the Eocene rocks of New Zealand fossil remains of a giant penguin (*Palæudyptes antarcticus*) have been found, indicating a bird 6 or 7 feet high.

PENHALLOW, pën-höl'lo, SAMUEL (1665-1726). An American colonist and historian, born at St. Mabon, Cornwall, England. He came to Massachusetts with the Rev. Charles Morton, his teacher, in 1686, lived for a time at Charlestown, Mass., and then removed to Portsmouth, N. H., where by marriage and business successes he acquired a considerable fortune and was successively made a magistrate, a member of the council, recorder of deeds, and justice of the Supreme Court of Judicature (1714), of which court he was Chief Justice from 1717 until his death. He was also for several years Treasurer of the Colony. He is remembered as the author of a *History of the Wars of New England with the Eastern Indians, or a Narrative of their Perfidy and Cruelty* (1726; reprinted in the *Collections of the New Hampshire Historical Society* in 1824 and separately at Cincinnati in 1859), which covers the period from 1703 to 1726, is the chief contemporary authority in English on Queen Anne's War and the so-called Lovewell's War, and has been of great value to historians.

PENICILLIUM (Lat. *penicillum*, *peniculus*, little tail or brush: cf. Lat. *peniculus*, small brush). The generic name of the common blue mold that develops on moist, stale bread and on other organic material. It belongs to the Ascomycetes (q.v.) and is characterized by the profusion of spore-bearing branches that arise

from the mycelium (q.v.), the terminal branches bearing rows of spores. It is a much used form in the laboratory, chiefly in experimental work in plant physiology.

PENIN'SULAR CAMPAIGN. The name given to the campaign of General McClellan, at the head of the Federal Army of the Potomac, against Richmond, Va., in April-July, 1862, during the Civil War. The campaign was so named because of McClellan's attempt to reach the Confederate capital by way of the peninsula formed by the York and the James rivers. For details, see CIVIL WAR IN AMERICA; GAINES'S MILL; MALVERN HILL; MCCLELLAN, G. B.; SEVEN DAYS' BATTLES; SEVEN PINES; WILLIAMSBURG; YORKTOWN.

PENINSULAR STATE. Florida. See STATES, POPULAR NAMES OF.

PENINSULAR WAR, THE. The struggle carried on in the Iberian Peninsula from 1807 to 1814 between the Emperor Napoleon on the one side and the Spaniards, the Portuguese, and the English on the other. After the Treaty of Tilsit Napoleon resolved to seize Portugal in order to enforce his Continental System (q.v.) against England. With the connivance of Spain a French army under Junot invaded Portugal and occupied Lisbon on Nov. 30, 1807. The flight of the royal family to Brazil left the Portuguese for the moment leaderless, but the English soon came to their assistance and, under the command of Sir Arthur Wellesley, afterward Duke of Wellington, defeated Junot at Vimero on Aug. 21, 1808, and by the Convention of Cintra, nine days later, forced him to evacuate Portugal. In the meantime the family affairs of Spanish royalty gave Napoleon a pretext for interfering in Spain. Armies under the direction of Murat occupied the country and on June 6, 1808, Joseph Bonaparte was proclaimed King of Spain. (See CHARLES IV; FERDINAND VII.) One of the divisions of the French army of occupation was trapped by the Spaniards and forced to surrender at Bailen (q.v.) on July 20, 1808. This disaster so startled Napoleon that immediately after the Congress of Erfurt he undertook in person a campaign in Spain with three large armies and occupied Madrid on Dec. 4, 1808. His army was lured away from Madrid by an English army under Sir John Moore, who invaded Spain from Portugal and then conducted a skillful retreat to Coruña. During the pursuit Napoleon turned over the command to Soult and hurried away to prepare for the campaign against Austria. While Napoleon's marshals were busy completing the conquest of the Peninsula, an English army under Wellesley landed at Lisbon on April 22, 1809. Having taken Oporto from Soult, Wellesley invaded Spain and fought a drawn battle with King Joseph and Marshal Victor at Talavera de la Reina on July 27-28. This battle saved Portugal from further harrying by the French, who, however, won a series of successes in Spain, including the victories of Almonacid on August 11 and Ocana on November 18. By the beginning of the summer of 1810 the French had subjugated practically the whole of Spain. The Province of Galicia and the fortified towns of Cadiz, Valencia, Badajoz, and Ciudad Rodrigo were the only important places still held by the Spaniards. During 1810 Napoleon hoped to take these places and to drive the English out of Portugal. With this purpose a large army under Masséna laid siege

to Ciudad Rodrigo, which was captured on July 19. Invading Portugal, Masséna captured Almeida on August 26 and, after a repulse by Wellington at Busaco on September 27, continued the pursuit of that general, who retired behind the well-fortified lines of Torres Vedras. The devastation of the country by the Portuguese, the incessant guerrilla warfare waged by the Spaniards, and the jealousies of the French marshals spoiled the plan of campaign. Soult captured Badajoz on March 11, 1811, but failed to cooperate with Masséna, who was forced to abandon the attempt to carry the lines of Torres Vedras in order to prevent the recapture of Almeida. Wellington defeated Masséna at Fuentes de Oñoro on May 5 and the English reoccupied Almeida. In January, 1812, Wellington took the offensive, captured Ciudad Rodrigo on January 19 and Badajoz on April 6, and defeated Marmont at Salamanca on July 22, but failed to capture Burgos and retired into winter quarters in Portugal. Elsewhere in Spain the French held their own until the withdrawal of troops from the Peninsula for the campaign of 1813 in Germany. The resumption of hostilities by Wellington forced King Joseph to abandon his capital and retreat towards the northern mountains. Wellington pushed the campaign with vigor, defeating Joseph and Jourdan at Vitoria on June 21, 1813, capturing San Sebastián on August 31 and invading France. Soult failed in successive attempts to check Wellington's victorious advance in southern France in the battles on the Nivelle, on the Nive, at Orthez on Feb. 27, 1814, and at Toulouse on April 10. Suchet succeeded in withdrawing his army from Aragon without loss and was marching to the assistance of Soult when the news of Napoleon's abdication arrived. The termination of the war at this moment enabled the English to transport many of Wellington's veterans to America to take part in the campaign of 1814 against the United States. Politically the invasion of the Peninsula was the most costly error in Napoleon's career, for there he first aroused that spirit of nationality which was destined to bring disaster on him not only in Spain but in Germany as well. From a military point of view the war in the Peninsula was a stupendous blunder for Napoleon, for it made a wanton increase in the number of his foes, it gave England her longed-for opportunity of fighting him on land, while its campaigns and its guerrilla warfare cost Napoleon thousands of men and proved demoralizing to the efficiency of his army. In his final campaigns he found himself with a formidable foe at his rear and was therefore unable to put in the field against his great continental enemies, Austria, Prussia, and Russia, the full military power of the French nation.

Bibliography. The best brief sketch is A. I. Shand, *The War in the Peninsula* (New York, 1898). The standard works are M. S. Foy, *Histoire de la guerre de la Péninsule sous Napoléon* (3d ed., 4 vols., Paris, 1828), and Sir W. F. P. Napier, *History of the War in the Peninsula* (new ed., 6 vols., London, 1850). The best works of recent scholarship are Gómez de Arteche y Moro, *Guerra de la independencia* (14 vols., Madrid, 1868-1903); Latino Coelho, *Historia política e militar desde os fins do 18 século ate 1814* (Lisbon, 1886); C. W. C. Oman, *History of the Peninsular War*, vols. i-v (New York, 1902-14). An extensive bibliography will

be found in *The Cambridge Modern History*, vol. ix (ib., 1906).

PENITENTIAL PSALMS. A name given to seven of the psalms as being specially expressive of sorrow for sin and accepted by Christian devotion as forms of prayer suitable for the repentant sinner. They are Psalms vi, xxxii, xxxviii, li, cii, cxxx, and cxliii, according to the Authorized Version, which correspond with vi, xxxi, xxxvii, l, ci, cxxix, and cxlii of the Vulgate. These psalms were set apart at a very early period, and the collection is referred to by Origen. Pope Innocent III ordered that they should be recited in Lent.

PENITENTIARY. A term commonly used as synonymous with prison (q.v.).

PENITENTIARY. In the history of the Roman Catholic church, a priest attached to cathedral churches, whose special duty it is to deal with difficult cases of the judgment to be passed on grave sins and the penance to be prescribed for them. The custom of appointing such officials is at least as old as the outbreak of the Novatianist schism; but the fourth Lateran Council, of 1215, prescribed their appointment for all metropolitan and cathedral churches, to represent the bishop in such matters when he was absent or otherwise hindered from giving his personal attention to the matter. Since the Council of Trent the office has normally been held by a member of the cathedral chapter, sometimes combined with that of vicar-general, and reserved cases are given into his hands. The cardinal penitentiary is an officer of the Roman curia who holds a corresponding position in regard to cases of absolution or dispensation such as are reserved to papal decision. He must be a priest and hold the degree of master in theology or doctor in canon law. He is assisted by an official theologian and canonist, and has a number of subordinates, who together make up the branch of the Roman administration called the *Penitentiaria*. A monthly session is held for the discussion of the more important cases, which are then, if necessary, referred directly to the Pope.

PÉNJAMO, pán'hà-mò. A town of Guanaajuato, Mexico, 50 miles southwest of the city of that name (Map: Mexico, H 7). Pop., 1900, 8262; 1910, 9328. The patriot Hidalgo was born on the neighboring hacienda of Corralejo, and here, in 1817, the filibuster Mina was shot.

PENJDEH, pènj'dà. An oasis in the southern part of Russian Turkestan, 25 miles from the boundary of Afghanistan (Map: Asia, Central, K 4). It belonged to the latter country until 1885; in that year it was the scene of the defeat of a body of Afghan troops by the Russians, which brought about strained relations between England and Russia. Pop., about 117,000.

PENKNIVES. See CUTLERY.

PEN'LEY, WILLIAM SYDNEY (1851-1912). An English actor, born at Broadstairs. His first success was as the curate in the comedy *The Private Secretary*, but he was best known for his part in Brandon Thomas's (q.v.) *Charley's Aunt* (1892), a farce that had a remarkably long run in both England and the United States.

PENMANSHIP. See HANDWRITING.

PENN, JOHN (1729-95). A proprietary lieutenant governor of Pennsylvania. He was born in London and was a grandson of William Penn. After a course in the University of Geneva he went to Pennsylvania, where, in 1753, he was appointed a member of the Provincial Council

He was a member of the Albany Congress of 1754, and in 1763 became Lieutenant Governor of Pennsylvania, which office he held until 1771, and then, after a visit to England, from 1773 to 1775. When the Revolutionary War broke out, although he attempted to maintain a neutral attitude, his authority was soon superseded by that of a revolutionary government, and in 1777 he was imprisoned, but after a few months was released. He received one-fourth of the £130,000 voted by the Legislature in compensation for the confiscated proprietary rights, and the same share of a £4000 annuity later granted the proprietors by the English government. Consult *The Pennsylvania Archives* and W. R. Shepherd, "Proprietary Government in Pennsylvania," in *Columbia University Studies in History, Economics, and Public Law*, vol. vi (New York, 1896).

PENN, JOHN (1741-88). An American patriot, one of the signers of the Declaration of Independence, born in Carolina Co., Va. He was admitted to the bar in 1762 and soon acquired a reputation as an eloquent and successful pleader. In 1774 he removed to Granville Co., N. C., and almost immediately became prominent there. Having espoused the Patriot cause, he was, in September, 1775, chosen a delegate to the Continental Congress, and next year signed the Declaration of Independence. He was rechosen delegate in 1777 and once again in 1779. In 1780, after the disastrous defeat of Camden, he virtually became dictator in North Carolina and did much to assist General Greene in his campaign against the invaders under Cornwallis. In 1784 he was appointed receiver of taxes for North Carolina by Robert Morris, but found his duties so disagreeable that he soon resigned.

PENN, RICHARD (c.1735-1811). A British Colonial Governor in America, born in England. He was a grandson of William Penn and was educated at St John's College, Cambridge. He began the study of law, but went to Pennsylvania in 1763, became a member of the Council in 1764, and remained, probably, until 1769. When his brother John, who was Lieutenant Governor, returned to England in 1771, Richard was sent out in his stead and served until August, 1773. He was very popular with both colonists and Indians. With Arthur Lee he carried the petition of the Congress to England. When examined before the House of Lords as to the ability and disposition of the colonists to resist the acts of Parliament, he was sharply reproved by the Ministers for his obvious sympathy with resistance. From 1784 until 1809 he represented various boroughs in Parliament.

PENN, THOMAS (1702-75). A British Colonial Proprietor, son of William Penn, the founder of Pennsylvania. He was born in Kensington and in 1718 succeeded to one-fourth of the proprietorship of Pennsylvania. In 1732 he went to Philadelphia. He held a power of attorney for his two brothers and assumed direction of the Colony until the arrival of his elder brother, John, in 1734. He remained in the Colony after his brother's return to England, presided at many of the Council meetings up to 1739, and held a great conference with the Indians in 1740. In 1747, upon the death of his elder brother, he inherited the latter's half interest and went to England to take charge. During the French and Indian War he sent £5000 for the relief of the Colony, having pre-

viously given money and land for the establishment of a public library in Philadelphia. When the dispute over taxation of the proprietary estates arose, he received Franklin, the agent of the Colony, who brought the Heads of Complaint in 1757, and he vigorously opposed the petition of the Colony, in 1764, that the crown should assume charge. His interest was finally purchased by the State.

PENN, SIR WILLIAM (1621-70). A British sailor, probably born in Bristol, England. He was brought up to follow the sea, and under the Commonwealth held many important naval commands. In 1649 he was appointed vice admiral of the Irish fleet, and in 1650-51 cruised along the coast of southern Europe and in the Mediterranean, seeking Prince Rupert. In 1652 he was appointed vice admiral of the fleet under Gen. Robert Blake (q.v.) and participated in the victory off Portland (Feb. 18, 1653) and those of June 3 and July 31. After the conclusion of the Dutch War Penn entered into negotiations with the Stuarts, but these proving fruitless, he accepted the command of a fleet sent against the Spanish possessions in America and on May 17, 1655, captured the island of Jamaica. In 1660 he was knighted by the King and was appointed a commissioner of the navy. Five years later he won, though nominally under the command of the Duke of York, a victory over the Dutch near Lowestoft (June 3, 1665). Consult Granville Penn, *Memorials of the Professional Life and Times of Sir William Penn* (2 vols., London, 1833).

PENN, WILLIAM (1644-1718). A celebrated English Quaker and the founder of Pennsylvania. He was the son of Sir William Penn, was born at Tower Hill, London, Oct. 14, 1644, and was educated chiefly at Christ Church, Oxford, where he became a Quaker. His enthusiasm for his new faith assumed a pugnacious form. Not only did he object to attending the services of the Church of England and to wearing the surplice of a student, both of which he considered papistical, but, along with some companions, who had also become Quakers, he attacked several of his fellow students and tore the obnoxious robes from their backs. For this conduct Penn was expelled from the university. His father was excessively annoyed at his conduct and, seeking a cure for his fanaticism, sent him to travel on the Continent, where he became a frequent guest at the court of Louis XIV. He returned to England in 1664, studied law at Lincoln's Inn for a year or more, and was then sent by his father to Ireland to look after his estates in the County of Cork. In the city of Cork, however, he fell in with Thomas Loe, and for attending a Quaker meeting was, along with some others, imprisoned by the mayor, though he was promptly released. He now became a minister and returned to England, where he and his father again quarreled because his conscience would not allow him to take off his hat to anybody, not even to the King, the Duke of York, or the admiral himself. Penn was for a second time turned out of doors by his father, but his mother smoothed matters so far that he was allowed to return home, and the admiral even exerted his influence with the government to wink at his son's attendance at the illegal conventicles of the Quakers, which nothing could induce him to give up. Meantime he was engaged in preaching and writing tracts on various religious subjects. In 1668, however, he was

WILLIAM PENN
AFTER THE PAINTING BY BENJAMIN WEST

thrown into the Tower, where he was confined for more than eight months on account of a publication entitled *The Sandy Foundation Shaken*, in which he attacked the ordinary doctrines of the Trinity. While in prison he wrote the most famous and most popular of his books, *No Cross, No Crown*, and *Innocency with her Open Face*, a vindication of himself which contributed to his liberation through the interference of the Duke of York. In September, 1670, Admiral Penn died, leaving his son an estate of £1500 a year, together with claims upon the crown for £16,000. In 1671 he was again committed to the Tower for preaching in violation of the Conventicle Act and, as he would take no oath at his trial, he was sent to Newgate for six months. Here he wrote four treatises, one of which, entitled *The Great Case of Liberty of Conscience*, is an admirable defense of the doctrine of toleration. After regaining his liberty he, together with Fox and Barclay, visited Holland and Germany for the advancement of Quaker interests. The Countess Palatine Elizabeth, the granddaughter of James I, showed him particular favor. On his return he again engaged in preaching and writing on religious topics, but circumstances soon turned his attention to the New World. In 1676 Penn and several associates founded a Quaker colony in West Jersey, which had come into their possession by purchase. In 1681 Penn obtained from the crown, in lieu of the £16,000 mentioned above, a grant of the territory from which the boundaries of the present State of Pennsylvania were determined. By a royal charter he was made Lord Proprietor of the territory of Pennsylvania. His great desire was to establish a home for his coreligionists in America, where they might preach and practice their convictions in unmolested peace. In the same year he sent out a governor to take possession of the province, and in the following year, 1682, with several friends, sailed for the Delaware, arriving in October. After taking formal possession he laid out a site for a new capital, which he named Philadelphia. Some time during the following year he had his famous interview with the Indians under the great elm at Shakumaxon (now Kensington) and concluded a treaty of lasting friendship with them. Penn's colony in its infancy escaped the horrors of Indian warfare which befell some of the other American settlements, and under the liberal though weak and confused government of its founder made immense progress during the next few years. Not only Quakers, but persecuted members of other religious sects, sought refuge in his new colony, where from the first the principle of toleration was established by law. Having called the colonists together, he gave the colony a constitution in 24 articles. Almost from the beginning Delaware, which was secured by a grant from the Duke of York, formed part of the Pennsylvania colony. In 1682 Penn and other Quakers bought East Jersey. Neither West Jersey nor East Jersey, however, remained permanently in the possession of the Quakers, the whole region being surrendered to the crown in 1702. Towards the end of the reign of Charles II, in 1684, Penn returned to England to exert himself in favor of his persecuted brethren at home, leaving behind a prosperous colony of 7000 inhabitants. His influence with James II, an old friend of his father, was so great that his exertions in favor of the Quakers

secured in 1686 a proclamation by which all persons imprisoned on account of their religious opinions were released, and more than 1200 Quakers were set free. In the April following, largely as a result of the same influence, James issued an edict for the repeal of all religious tests and penalties, but the mass of nonconformists distrusted his sincerity and refused to avail themselves of it. After the accession of the Prince of Orange as William III, Penn was twice accused of treason as a result of his relations with the exiled monarch, but was acquitted. In 1690 he was arrested on a charge of conspiracy, but was again acquitted for lack of evidence. Nevertheless in the following year the charge was renewed, and for a time he was deprived of the government of Pennsylvania. Nothing further appears to have been done for some time, but at last through the kindly offices of his friends, Locke, Tillotson, and others, the matter was thoroughly investigated, and he was finally and honorably acquitted, November, 1693, and restored to the government of his province. In 1699 he paid a second visit to the New World and found Pennsylvania in a prosperous condition. His stay, which lasted two years, was marked by many liberal measures and by efforts to ameliorate the condition both of the Indians and of the negroes. Penn departed for England towards the end of 1701, where by the treacherous manipulations of his steward, Ford, he was financially ruined. When Ford died he left to his widow and son false claims against his principal, and these were so ruthlessly pressed that Penn allowed himself to be thrown into Fleet Prison in 1708 to avoid extortion. His friends afterward procured his release, but not until his health had been fatally impaired. Later he was stricken with paralysis and in this condition lingered until his death, May 30, 1718. He was twice married and left issue by both marriages.

Bibliography. The works of Penn were published in 1782 in five volumes and again in 1825 in three volumes. His *Memoirs* were edited by Thomas Clarkson (2 vols., Philadelphia, 1813). Consult also: S. M. Janney, *Life of William Penn* (6th ed., ib., 1882); W. H. Dixon, *History of William Penn* (new ed., New York, 1903), refuting charges made by Lord Macaulay; S. G. Fisher, *The True William Penn* (Philadelphia, 1900); A. C. Buell, *William Penn as the Founder of Two Commonwealths* (ib., 1904); Mrs. Colquhoun Grant, *Quaker and Courtier: The Life and Work of William Penn* (ib., 1908).

PEN'NACOOK (nut place, or crooked place). A confederacy of Algonquian tribes formerly occupying the Merrimac River basin and adjacent region in New Hampshire, Massachusetts, and southern Maine. They occupied a middle ground between the southern New England tribes, with whom the English had dealing, and the Abnaki and others of the north, who were under French influence. Their early treaties were with the English, but their later alliances were with the French. The capital of the confederacy and the residence of the head chief, Passaconaway, was at Amoskeag, the present Manchester, N. H. Wamesit village, with Pawtucket Falls, was the great rendezvous during the fishing season. When first known to the English the Pennacook were estimated at 3000, which was probably below their real number, under the rule of the noted chief and medicine man, Passaconaway. He was friendly to the whites and invited the English to

settle upon the Merrimac. Before his death, about 1669, he saw almost his whole country in the hands of the whites and was himself obliged to petition for enough ground to live upon. In the meantime his people had been reduced by smallpox and other introduced diseases to about 1200. On the outbreak of King Philip's War in 1675 one or two of the Pennacook bands joined the hostile Indians, but the greater portion, under Wanalancet, the son of Passaconaway, remained on friendly terms with the English until, angered by the treacherous seizure of a number of their people, they abandoned their country and fled, part to the French in Canada, others to the Mohican on the Hudson. Those who removed to Canada were finally settled at St. Francis, Quebec Province.

PEN'NAMITE-YANKEE WAR. See WYOMING VALLEY.

PEN'NANT (variant of *pennon*, with excrement *t*, possibly associated by popular etymology with *pendant*, from OF., Fr. *pennon*, sort of flag, augmentative of OF. *penne*, from Lat. *penna*, feather, wing). A narrow flag or streamer tapering from the hoist to the fly or tip. In the signal codes pennants are two to five times as long as they are wide. The old commodores' broad pennant was a swallow-tail flag. The pennant of the senior officer present is blue and nearly equilateral. The narrow pennant worn by all vessels commissioned in the government service is carried at the main and signifies that she is a national ship. See Colored Plate of FLAGS OF THE UNITED STATES with UNITED STATES, and of INTERNATIONAL SIGNAL CODE with SIGNALS, MARINE.

PENNANT, THOMAS (1726-98). A British naturalist, born at Downing, near Holywell, in Flintshire, and educated at Queen's College, Oxford. In 1754 he visited Ireland, and about this time began those tours of the British Islands the published accounts of which contributed greatly to his reputation. In 1761 he began his *British Zoology*, the first part of which was published five years later. This work and his *History of Quadrupeds* (1781) were long held in the highest esteem by scientists. Among his other writings are: *Tours in Scotland* (3 vols., 1771-90); *Arctic Zoology* (1784-87); *Outlines of the Globe* (1798-1800); *Tours in Wales* (3 vols., 1778). Consult *The Literary Life of the Late Thomas Pennant, Esq., by Himself* (London, 1798), and W. T. Parkinson, *Memoir*, in Rhys's edition of the *Tours in Wales* (1883).

PENNANT'S MARTEN. See FISHER.

PENNANT-WINGED NIGHTJAR. A nightjar (*Macrodipteryx vexillarius*) of equatorial Africa, in which one of the quill feathers in each wing is greatly elongated and has a vane only near the end. The bird is rare and little known, but has been observed in the daytime seated upon the ground with the two modified wing feathers held perfectly erect, their feathery tips fluttering among the grass heads, from which they were scarcely to be distinguished. Cf. STANDARD-WING, and see Plate of NIGHTJARS.

PENN COLLEGE. A coeducational institution for higher education, founded at Oskaloosa, Iowa, in 1875 under the auspices of the Friends. The college comprises collegiate, preparatory, music, commercial, and normal courses, leading to the degrees of A.B., S.B., and Ph.B. There is an academy also, with the usual preparatory courses. The total enrollment in all departments in 1914-15 was 555, and the instructors

numbered 30. The college property is valued at \$300,000, the grounds and building at about \$200,000, and the endowment at \$274,000. The annual income amounts to about \$16,000. The library contains about 10,000 volumes. The president in 1915 was David Morton Edwards, Ph.D.

PENNELL, pen'el, JOSEPH (1860-). One of the foremost American etchers and lithographers, also a writer of note. He was born at Philadelphia, July 4, 1860, of Quaker parentage, was a pupil of the Pennsylvania Academy of Fine Arts and of the Pennsylvania School of Industrial Art, and studied etching with Stephen J. Ferris. In 1884 he went to Europe, where he chiefly lived thereafter, traveling in pursuit of his work or residing in London; however, he made several long stays in America. In London he was strongly influenced by his friend Whistler, but without losing originality. He is certainly the most widely known of all American graphic artists. He is represented by drawings, etchings, and lithographs in virtually all the European collections of graphic art, such as the Luxembourg (Paris), National Gallery (Berlin), the Uffizi (Florence), National Gallery (Rome), British Museum and Victoria and Albert Museum (London), Library of Congress (Washington), and the Brooklyn Museum. He became a member of the National Academy (1909), of the National Institute of Arts and Letters, and of most of the important European societies to which graphic artists belong. He received gold medals or grand prizes at Paris (1900), Chicago, Dresden, Milan, and St. Louis.

Pennell excels alike in etching and in lithography, in which mediums he has command of all technical means. His art is simple and direct. He displays a remarkable power of selection and grasp of the artistic possibilities of a subject, witness his early Philadelphia etchings and his later ones of New York and the Panama Canal. His subjects are both architectural and landscape, the figures being incidental. Among his principal works are: *A Canterbury Pilgrimage* (1885); *An Italian Pilgrimage* (1886); *Our Sentimental Journey through France and Italy* (1888); *Pen Drawing and Pen Draftsmen* (1889); *To Gypsy Land* (1893); *Modern Illustration* (1895); *Lithographs of New York* (1905); *Pictures of the Panama Canal* (1912); *The Glory of Greece* (1914); *Our Philadelphia* (1914). Among the books which he illustrated are: W. D. Howells, *Tuscan Cities* (1885); Washington Irving, *Alhambra* (1897); Mrs. Schuyler van Rensselaer, *English Cathedrals* (1902); Maurice Hewlett, *The Road in Tuscany* (1904); Henry James, *Italian Hours* and *A Little Tour in France*. His wife, ELIZABETH ROBINS PENNELL, furnished the text for many of his series, was joint author with him of *Lithography and Lithographers* (1900; new ed., 1915) and *The Authorized Life of J. McN. Whistler* (1910), and was sole author of a biography of her uncle, *Charles Godfrey Leland* (2 vols., 1906), known as Hans Breitmann in humorous literature.

PEN'NETHORNE, JOHN (1808-88). An English architect and antiquary, born at Worcester. He became a favorite pupil of John Nash (q.v.) and after 1830 spent five years on the Continent in the study of architecture. He was the first to announce the discovery of the

curved lines and other optical refinements in the Parthenon and the Temple of Medinet Abu. His theories were set forth in the pamphlet, *The Elements and Mathematical Principles of the Greek Architects and Artists, Recovered by an Analysis and Study of the Remaining Works of Architecture Designed and Erected in the Age of Pericles* (1844). Pennethorne is also author of *The Geometry and Optics of Ancient Architecture; Illustrated by Examples from Thebes, Athens, and Rome* (1878).

PENNI, pĕn'ē, GIANFRANCESCO, called IL FATTORE (c.1488-c.1528). An Italian painter, born in Florence. He was one of the favorite pupils and a friend of Raphael, and with Giulio Romano was his legatee and artistic executor. He painted from Raphael's designs in the Farnesina, and the Loggie and the Sala di Costantino in the Vatican, and made an excellent copy of the "Entombment" (now in the Turin Gallery), besides assisting his master in various other commissions. His original work is of little importance.

PEN'NINE ALPS. See ALPS.

PENNINE CHAIN. A range of hills in northern England. See UNITED KINGDOM.

PENNSYLVANIA {from *Penn* + Neo-Lat. *sylvania*, woodland, from Lat. *sylvanus*, *sylvanus*, relating to a forest, from *silva*, *sylva*, wood forest; named in honor of William Penn). A North Atlantic State of the United States, situated at the apex of the arch formed by the coast States from North Carolina to New England, whence it is popularly called the Keystone State. It lies between lat. 39° 43' and 42° 15' N. and between long. 74° 43' and 80° 31' W. It is bounded on the north by Lake Erie and New York, on the east by New York and New Jersey, on the south by a small part of Delaware and by Maryland and West Virginia, and on the west by West Virginia and Ohio. In shape it forms a rectangle. The north and south boundaries are straight lines running along parallels 157¼ miles apart, except for the small projection of the northwestern corner. The west boundary is a straight line running along the meridian, but the east boundary is formed by the Delaware River, which forms two large and regular zigzag bends, making the extreme length of the State 302 miles. The area is 45,126 square miles, of which 44,832 square miles are land surface. Pennsylvania ranks thirty-second in size among the States of the United States.

Topography. Three of the great physiographic belts which form the eastern United States are recognized in this State, running across its territory from southwest to northeast. The Atlantic coastal plain merely touches the southeast corner, and the first great physiographic belt is the piedmont plateau or plain (q.v.), which occupies the southeast portion between the lower course of the Delaware River and the Blue or Kittatinny Mountain Range. It has a width of about 60 miles and rises, by gentle undulations from ocean level at the Delaware estuary, to an elevation of 500 feet at the base of the mountains. It is broken, however, by several low ridges in the southeast and farther inland by the interrupted chain of semi-isolated groups of hills known as the South Mountain, which farther north becomes the Highlands of New Jersey and New York. The second belt is the Appalachian valley. This great physiographic feature extends from New

York to Alabama and Georgia and embraces the valley of eastern Tennessee and Virginia. In Pennsylvania it includes the Cumberland valley in the south and the Lebanon valley in the east. On the east and southeast this structural belt is defined by the Blue Ridge and Kittatinny ranges and on the northwest by the Alleghany plateau. The valleys, running in a general northeast-southwest direction, are occupied by streams, which have occasionally succeeded in cutting their way through the bounding mountain chain into an adjoining valley. Nearly all of this great belt lying in Pennsylvania is drained by the Susquehanna River. Towards the west it merges into the next physiographic belt, the change being more abrupt towards the southwest than farther northward. The highest portion of the State is in this belt, and the culminating point is Blue Knob, in Blair County, 3136 feet above ocean level. The third physiographic belt is the Alleghany plateau, the northern portion of the great Appalachian plateau which stretches from Tennessee to New York. This division covers the western half of the State at an elevation of 1000 to 2000 feet, sloping gently from the northeast towards the southwest. At an earlier geological period this plateau was a vast peneplain, but owing to revived stream action, caused by an elevation towards the northeast, the whole has been deeply carved and is intersected by a complicated valley system incised into the one-time plain, often to a depth of 500 or even 800 feet. Preceding the glacial period this portion of the State drained into the basin now occupied by Lake Erie, but the elevation of the land to the northward and the incoming of the ice, with its enormous deposits of glacial debris, reversed the direction of flow and established drainage as we now find it. The line of 1000 feet elevation is only 2 to 5 miles from the shore of Lake Erie, so there is here no lake-shore plain.

Hydrography. The three chief river systems are, in the order of their drainage areas, the Susquehanna, the Ohio, and the Delaware. These together drain over 90 per cent of the State. An insignificant area in the south belongs to the Potomac system and one in the north to the Genesee, while the extreme northwest corner is drained by short streams flowing into Lake Erie. The Delaware, which is navigable for the largest ships to Philadelphia and for small steamers some distance above, drains the east slope through its right tributaries, chief of which are the Lehigh and the Schuylkill. The Susquehanna crosses the State in a large zigzag from north to south, cutting through the various mountain ranges in narrow gaps, receiving its two main tributaries, the West Branch and the Juniata, from the west. It is broad, but shallow and unnavigable. The western part of the State is drained by the Ohio and its two great head streams, the Allegheny and Monongahela. The Allegheny is navigable for boats of light draft for a long distance, and the Monongahela, through its system of dams and locks, far into West Virginia.

Climate. The climate in the southeastern part along the Delaware is much warmer, both in summer and in winter, than in the western upland. The mean temperature for January at Philadelphia is 32.3° F. and for July 76.2° F. The corresponding figures for Wilkes-Barre, among the mountains, are 27° F. and 72° F.; for Pittsburgh, 31° F. and 75° F.;

and for Erie, on the lake shore, 27° F. and 70° F. The summer heat south of the Blue Mountain has been as high as 107° F. and is prolonged far into autumn. Northwest of the mountains the snow sometimes lies several feet deep throughout the winter, and the temperature may fall to 28° below zero. The average annual rainfall for the State is 44.6 inches. It is evenly distributed both as to season and through the larger regions of the State, though it may range from 35 to 50 inches in isolated localities.

Soil and Vegetation. The soils are on the whole somewhat more fertile than those of the average Atlantic State, there being no Tertiary sand area and comparatively small areas of primary rocks.

The soil is to a large extent decomposed limestone material, which is a good grain soil and, where least fertile, is well suited for pasturage.

Pennsylvania was originally one of the most densely forested States, but little virgin forest now remains.

Geology. The geological section in Pennsylvania includes rocks of all ages, from the Triassic down to the igneous and metamorphic (Archean) rocks found in the southeast. The lowest rocks geologically are in the southeast corner, and they become progressively later in age as one passes westward. In addition to the consolidated rocks large areas in the northeast and northwest are covered with glacial materials, and along the south-flowing streams are great terraces, the materials of which have been derived from glacial action. The piedmont plateau and the Appalachian Mountains consist of igneous rocks (granite, gneiss, diabase, and allied rocks) which have solidified from a molten magma and of sedimentary rocks which have been altered into slates, quartzites, or schists by metamorphic action. These are but part of the great belt of igneous and metamorphic rocks which extends along the eastern flank of the Appalachian Mountain system, and in Pennsylvania they have a general width of about 60 miles. In Pennsylvania this formation is split into two portions by a band of Triassic rocks, mainly red sandstone, which reaches in an irregular belt from the Delaware River southwesterly to the Maryland line. This area of Triassic rocks, as also the adjoining areas of igneous and metamorphic rocks, is cut by many intrusions of later age, largely trap dikes. The area of older rocks northwest of the Triassic belt has been formed into the South Mountain Range. West and northwest of this, rocks of Paleozoic age occupy the rest of the State. In the Appalachian valley division the rocks consist almost entirely of limestone, shale, and sandstone. When formed these were deposited horizontally, but we now find them lying at almost every angle of slope. It is therefore the edges of the several formations which outcrop, and they are found in long narrow irregular lines, roughly parallel. The more easily eroded and soluble rocks form the valleys and the more resistant ones the mountain chains, and therefore the valleys are largely of limestone. West of the Appalachian valley division the rocks become more and more horizontal, so that in much of the northwest and west portions the folding is very slight and has not been sufficient to control the lines of drainage. The outcrops of the older Paleozoic rocks, Cambrian, Ordovician, Silurian, and Devonian in age, lie roughly

parallel, the lower members abutting on the South Mountain chain. This area of older Paleozoic rocks is an extension of the same formations in south New York and in New Jersey. Following the time of the deposition of the rocks of Carboniferous age, this region was profoundly folded. The great expanse of Paleozoic sediments in the Ohio valley and adjacent regions formed a great buttress against which an almost irresistible horizontal thrust from the southeast forced the mass of sediments now found in the Appalachian valley. In addition to the belt of these older Paleozoic rocks now forming the mountains, there is a broad expanse of rocks of Devonian age along the north, extending westward to the Ohio State line. In the folding of the rocks along the mountain system there were left in the bottom of some of the deeper folds rocks of a later age, the true Carboniferous, constituting what we know as the anthracite coal region and the Broad-Top coal field of Huntingdon, Bedford, and Fulton counties. The presence of these rocks shows that the conditions which were favorable for the deposition of the formations of that age in the western portion of the State also existed over the now mountain region and determines the age of the folding as later than the deposition of the Carboniferous. These coals have been affected by the pressure and heat produced by the folding, the same as the other rocks of the series, and the character of the coal has been changed to anthracite in the more northern basins, while in the Broad-Top field, where metamorphic action is less pronounced, the coal can only be classed as semibituminous.

Mineral Resources. In addition to the coals before mentioned the western portion is entirely formed, south of the strip of Devonian rocks along the northern border, of rocks of Carboniferous age. These have been divided into several well-recognized series, most of which are coal bearing. The most noted of these coal beds is the Pittsburgh, which has been called the "most valuable mineral deposit on the face of the earth." There is annually mined from this bed in Pennsylvania about 100,000,000 tons. In the east portion there are valuable deposits of slate, graphite, iron ores, with smaller quantities of zinc, copper, soapstone, nickel, marble, other building stones, and limestone. In the west portion of the State, underlying in the main the rocks of Carboniferous age and mainly found in the Devonian rocks, are large quantities of petroleum and natural gas.

Mining. In 1913 the value of the products of the mines, excluding all duplications and derived products (coke, pig iron, etc.), was \$506,466,759, or 24.7 per cent of the total for the United States, and greater than the combined output of West Virginia, Ohio, Illinois, and California, the four States next in value of production. The output of anthracite coal in that year was 81,718,680 long tons, valued at \$195,181,127, while the output of bituminous coal reached the total of 173,781,217 short tons, valued at \$193,039,806. The value of the total coal production, more than \$388,000,000, was greater than that in any foreign country except Great Britain and Germany. Anthracite coal is now used almost exclusively as a domestic fuel, and it is probable that its output will not greatly increase over what it is at present. The output of bituminous coal, on the contrary, has regularly doubled each decade,

and it will undoubtedly continue to increase. The effect of the enormous output is being felt in several fields. The futurity under existing conditions of the great Pittsburgh bed will be less than 50 years. Portions of this bed constitute the famous Connellsville coking region, where the standard coke of the United States is made. The output of coke in Pennsylvania in 1913 was 28,753,444 short tons, valued at \$67,929,864. This value is not included in the State total heretofore given. The portion of coke made in by-product ovens is increasing, but the old-style beehive oven is almost exclusively used in the Connellsville and adjoining coke regions. While it is evident that Pennsylvania owes its unique position as a mineral producer to its coal, yet the State leads in the value of the mineral output other than coal, exceeding California by over \$15,000,000. There was produced, in 1913, 28,060,495 barrels of cement, the mineral second in importance; the output was valued at \$24,268,800. The Lehigh district, including the counties of Northampton, Carbon, Lehigh, and Berks in Pennsylvania and Warren County in New Jersey, the most important cement-producing region in the world, makes nearly one-third of the cement produced in the United States. Closely following cement come the clay products, the value of which was \$24,231,482. Pennsylvania ranks second among the States in total value of such products. The State ranks first in the output of brick and tile. The most important single clay product, as measured by value of output, is fire brick, the production being over one-third of the total output in the United States. All classes of brick and tile and terra cotta are made in Pennsylvania. In the production of natural gas Pennsylvania is second only to West Virginia. The value of output of this mineral was \$21,695,845. Pennsylvania ranks fifth in value of output of petroleum. In 1913 there were produced 7,963,282 barrels, valued at \$19,805,452. The State ranks first also in the production of stone, in output of slate, in the yield of sand and gravel, and in the production of lime. The value of the output of each for 1913 was as follows: stone, \$10,117,469; lime, \$2,743,197; slate, \$3,733,581; sand and gravel, \$3,381,692. Sixty per cent of the slate produced in the United States comes from Pennsylvania. The other products include copper, feldspar, glass sand, graphite, iron ore, metallic paints and mortar colors, mineral waters, ochre and sandlime brick. Pig iron to the value of \$197,726,314, and ferro-alloys to the value of \$10,939,453, both produced in the State in 1913, were not included in the total mineral output for that year.

Agriculture. Of an approximate land area of 28,692,480 acres, 18,586,832 acres were in farms in 1910, and the improved land in farms totaled 12,673,519 acres. The average Pennsylvania farm was 84.8 acres in size, and the average value per acre was \$56.01. The total number of farms in that year was 219,295. The total value of all farm property, including land and buildings, implements and machinery, and domestic animals, poultry, and bees, was \$1,253,274,862. Of the total number of farms, 168,190 were operated by owners and managers and 51,105 by tenants. There were 204,917 native white farmers and 13,832 foreign-born white, while 546 were negroes or other non-white. Of the foreign-born white 5048 came from Germany.

The following table gives the acreage, production, and value of the principal crops in 1914. The figures are estimates of the United States Department of Agriculture.

CROPS	Acreage	Prod. in bu.	Value
Hay .. .	3,141,000	*4,020,000	\$58,290,000
Corn .. .	1,463,000	62,178,000	45,390,000
Wheat .. .	1,312,000	23,747,000	24,687,000
Oats .. .	1,073,000	32,190,000	16,417,000
Rye .. .	280,000	5,040,000	4,183,000
Buckwheat .. .	280,000	5,740,000	4,362,000
Potatoes .. .	268,000	28,140,000	16,321,000
Tobacco .. .	33,100	†7,995,000	4,080,000

* Tons.

† Pounds.

The combined acreage under crops in 1910 was 7,826,562. Some 42.2 per cent of the total value of all crops was contributed by the cereals, 27.4 per cent by hay and forage, and 13.2 per cent by potatoes and other vegetables. In 1909 hay and forage covered 3,088,105 acres, from which were harvested 3,677,307 tons, valued at \$45,623,573. In the same year corn had an acreage of 1,380,671 and yielded 41,494,237 bushels, which were valued at \$27,330,860. Wheat, the next crop in importance, showed an acreage of 1,225,558, a production amounting to 21,564,479 bushels, with a value of \$22,920,638. Oats had an acreage of 1,144,248, a production of 28,172,686 bushels, with a value of \$14,421,972. Next in rank came potatoes, with an acreage of 262,013, a production of 21,740,611 bushels, valued at \$11,973,483. There were 41,742 acres in tobacco, of which 46,164,800 pounds were harvested. The total value of this crop was \$3,926,116. Buckwheat had an acreage of 292,728, from which 4,797,350 bushels were harvested; the production was valued at \$2,895,958. The total acreage of potatoes and other vegetables in 1910 was 357,430 and their value \$22,092,197. Excluding potatoes, the acreage of vegetables was 94,111 and their value \$10,014,000. Some 4860 acres were devoted in that year to flowers, plants, and nursery products, the output being valued at \$4,725,987. The most important of the small fruits is the strawberry, to which in 1909 there were devoted 4136 acres, and of which there were produced 9,033,904 quarts, valued at \$759,154. There was also a considerable production of raspberries, blackberries, and dewberries. In 1909 there were grown 13,286,000 bushels of orchard fruits, valued at \$8,678,000. Apples contributed about five-sixths of this value, peaches most of the remainder. In the same year 34,020,000 pounds of grapes, valued at \$851,000, and 3,796,000 pounds of nuts, valued at \$90,000, were grown.

Live Stock and Dairy Products. The total value of all live stock on farms in 1910 was \$133,327,286. According to the estimates of the United States Department of Agriculture there were on Jan. 1, 1915, on the farms: horses, 596,000, valued at \$79,864,000; mules, 46,000, valued at \$6,532,000; milch cows, 943,000, valued at \$56,108,000; cattle other than milch cows, 638,000, valued at \$18,693,000; sheep, 831,000, valued at \$4,404,000; swine, 1,186,000, valued at \$16,011,000.

Forest Products. In 1909 Pennsylvania ranked fourteenth in value of forest products. There were produced in that year by 3054 saw mills 1,462,771 M feet B. M. of rough lumber, 143,059 thousand lath, and 79,336 thousand

shingles. The soft woods, chiefly hemlock, white pine, and spruce, formed 56.1 per cent of the total lumber produced. Oak is by far the most important of the hard woods. Large quantities of chestnut, maple, beech, birch, hickory, yellow poplar, basswood, and ash are also cut. In 1913 there were reported 1159 active mills. The

contributed to make the State second in manufacturing only to New York, which position it has held since 1859. The value of manufactured products per capita in 1909 was \$343. The following table gives the most important figures relative to leading manufactures for 1904 and 1909.

COMPARATIVE SUMMARY FOR 1909 AND 1904

THE STATE — THE LEADING INDUSTRIES

INDUSTRY	Cen- sus	Number of estab- lish- ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manu- facture
			Total	Wage earners (average number)				
All industries	1909	27,563	1,002,171	877,543	\$2,749,006	\$455,627	\$2,626,742	\$1,044,182
	1904	23,495	855,392	763,282	1,995,837	367,961	1,955,551	812,008
Boots and shoes, including cut stock findings.	1909	140	11,829	10,822	11,661	4,266	20,219	8,155

* Excluding statistics for two establishments, to avoid disclosure of individual operations.

781,547 M feet B. M. of lumber sawed in that year placed the State nineteenth in total number sawed. In addition to that mentioned above there were produced on the farms of the State forest products valued at \$7,986,599. Maple sugar and sirup to the combined value of \$471,213 were also produced.

Manufactures. The abundance, variety, and importance of Pennsylvania's natural resources and its accessibility to sources of raw material and to markets for its finished products have

Pennsylvania has a great variety of manufacturing activities. Of the 264 classifications used in the compilation of the Statistics of Manufactures by the United States Census Bureau in 1909, 245 were recorded for Pennsylvania. It easily outranked all other States in 1909 in the value of products of its steel works and rolling mills and in the manufacture of tinplate and terneplate. These represented 50.8 per cent, 43.1 per cent, and 52.6 per cent respectively of the entire output of the United

States for each of the industries. The manufacture of iron dates back to 1692, and the first successful works were established in Berks County in 1716. Pennsylvania holds its position as the leading State in the manufacture of iron and steel since 1756. The total production of steel in 1909 was 12,189,953 tons, of which 23.4 per cent was Bessemer and 76.1 per cent open-hearth steel. The production of rails was 848,924 tons, valued at \$24,077,184; structural shapes, 1,597,946 tons, valued at \$49,512,361; bars and rods, 1,749,220 tons, valued at \$56,717,882. In 1909 the number of blast-furnace stacks was 145, with a daily capacity of 41,707 tons. The total value of products was \$168,578,413, of which \$167,588,407 was pig iron. The iron ore charged into these furnaces amounted to 20,822,023 tons and the fuel consumed 12,095,186 tons. In 1913 the State Department of Labor and Industry reported 2309 establishments engaged in the manufacture of metal and metal products. The capital invested was \$859,540,000 and the value of products \$1,159,067,800. The number of employees was reported as 473,176. The textile industry ranks second in value of products, Pennsylvania holding second place in the Union in this regard. In 1909 there were 1,971,907 producing spindles, of which 1,017,992 were employed in the manufacture of silk and silk goods. The looms numbered 63,038, the silk mills using 26,249. The value of the products of the combined textile industry was \$267,840,579. The manufacture of woolen, worsted, and felt goods was the leading branch of this industry in value of products. In 1913, 918 establishments were reported for the manufacture of textiles. The capital invested was \$149,233,500 and the value of products \$231,142,000. The total number of employees was 116,324, of which 47,556 were males. Pennsylvania ranked first (1909) in the value of products of the leather industry, the manufacture of coke, glass, and railway cars, second in petroleum refining, tobacco manufacturing, and in the production of malt liquors, third in the manufacture of clothing; and sixth in lumber and forest products.

Of the total number of wage earners in 1909 the males numbered 693,894 and the females 183,649. The wage earners under 16 years of age numbered 29,107, of whom 15,044 were females. By far the larger number of females and wage earners under 16 years were employed in the textile industries. The prevailing hours of labor in 1909 were between 54 and 60 per week, only about 12 per cent of the wage earners working less than 54 hours. In 1909 there were 63 places which had populations of 10,000 or over. These contributed 63.3 per cent of the total value of manufactured products and contained 62.9 per cent of the wage earners. Philadelphia is the largest and most important city of the State and third in population in the United States. In 1909 it contained 251,884 wage earners, and it manufactured products valued at \$746,075,659, ranking third among the cities of the country. The city leads all others in the production of all textiles, the combined value of the products of which was \$146,135,000, more than double that of its nearest competitor. The leading industries and the value of their products in 1909 were the manufacture of woolen and worsted goods, \$54,922,000, printing and publishing, \$45,807,000; foundries and machine shops, \$38,685,000, and the manufacture of

women's clothing, \$30,133,000. As compared with the State as a whole, Philadelphia manufactured, in 1909, 28.4 per cent of the products as judged by value and employed 28.7 per cent of the total wage earners.

Pittsburgh ranks second in value of products and population. In 1909 it ranked seventh among the cities of the United States. The value of products in that year was \$243,453,693 and the number of wage earners employed 67,474. Iron and steel are the most important products, the value of which in 1909 was \$82,307,000. The combined value of the output of the industries using ore and metal as principal materials was more than 50 per cent of the total value of manufactured products of the city. Other important industries are slaughtering and meat packing, printing and publishing, and railway-car construction. Reading ranked third, with products valued at \$51,134,967 in 1909. The number of wage earners employed was 24,145. The steel works and rolling mills are the most important industry. The value of their products in 1909 was \$8,170,000, and they gave employment to 3011 wage earners. Other important industrial establishments are steam-railroad repair shops, hosiery knitting mills, foundries and machine shops, factories of boots and shoes, confectionery, fur-felt hats, iron and steel pipe, etc. Reading is one of the most important manufacturing centres for fur-felt hats, its production in 1909 amounting to 30.9 per cent of the total value for the United States. Other important cities in order of rank are Johnstown, McKeesport, New Castle, South Bethlehem, Scranton, Allentown, Erie, Harrisburg, Chester, York, Altoona, Lancaster, Wilkes-Barre, and Williamsport. For detailed information regarding these cities, see under their separate titles.

Transportation. Lake Erie on the west, Delaware Bay on the east, and many miles of navigable streams afford Pennsylvania almost unsurpassed water connection with markets in all parts of the country, besides affording outlets for foreign trade. Numerous canals form connecting links where natural waterways fail. The State ranks third in mileage of railroads among the States. The total mileage of main track, branches, and spurs was 12,331 on June 30, 1913. The most important railroads with their total mileage were the Pennsylvania, 3239; the Philadelphia and Reading, 963, the Lehigh Valley, 657, the Baltimore and Ohio, 656; the New York Central and Hudson River, 643; the Erie, 576, the Buffalo, Rochester, and Pittsburgh, 385, the Northern Central (Pennsylvania System), 283, the Delaware, Lackawanna, and Western, 261; the Central of New Jersey, 237; the Lake Shore and Michigan Southern (New York Central System), 233; the Buffalo and Susquehanna, 232, the Pittsburgh and Lake Erie (New York Central System), 210.

Banks. The Bank of North America, originally chartered by Congress in 1781, was the first bank in Pennsylvania, where it obtained a charter in 1782. In 1793 the Bank of Pennsylvania was incorporated as the official agent of the State, which was heavily interested in it. A few other banks were chartered by individual acts of the Legislature. In 1814 there were six banks, and the State owned stock in the most important ones. In 1814 the State policy towards the banking business underwent a radical change. The Commonwealth was divided

into 27 banking districts, each of which was allotted a definite number of banks. Unincorporated banking was prohibited and a comprehensive banking law passed. This could not avert the injurious results of the speculative inflation, and in 1816 many banks had to suspend specie payments. Banking became the object of popular disfavor and was held responsible for the critical times. A law was passed in 1819 providing for forfeiture of charter in case of suspension of specie payments, and it somewhat reduced the number of banks. The period of extensive internal improvements that followed stimulated the

any other class of banking organizations. Trust companies are conducted mostly in conjunction with the banks and take care of business which the law prohibits the banks from doing. The first savings bank in Pennsylvania was chartered in 1819. Previous to the Civil War there were 14 of them. A general law for their regulation, strictly limiting their avenues for investment, was passed in 1889. A clearing house was established in Philadelphia in 1858, or five years later than the one in New York. The condition of the banks in 1914 is shown as follows:

	National banks	State banks	Trust companies	Private banks	Mutual savings banks
Number	837	172	285	16	12
Capital.....	\$120,141,000	\$17,541,000	\$99,964,000	\$449,000	
Surplus.....	134,212,000	20,056,000	134,096,000	485,000	\$17,948,000
Cash, etc.....	94,131,000	6,461,000	27,368,000	138,000	2,609,000
Deposits.....	803,637,000	175,463,000	525,083,000	3,332,000	218,844,000
Loans.....	743,915,000	112,706,000	403,073,000	2,649,000	36,412,000

There were 500,465 depositors in the savings banks.

banking business as well as all other business of the State, and for 10 years the banks were exceptionally prosperous. In 1836 the second United States Bank, at the expiration of its national charter, became a Pennsylvania State institution, paying heavily for the privilege. The crisis of 1837 again caused a suspension of specie payment, and in 1840 after a hard struggle the United States Bank failed, ruined by its heavy investments in the State improvements and its heavy contributions to the State treasury. This failure, together with financial difficulties of the State treasury between 1840 and 1845, was felt by the other banks, and the stocks of most of them were sold far below par. Efforts were made to correct this by special legislation, by the levying of a tax on banking stock below par, and by making specie payments obligatory; but this last provision was frequently suspended by necessity. A slight improvement between 1850 and 1855 was followed by the severe crisis of 1857, when several Pennsylvania banks failed and a general suspension followed.

An agitation for a free banking system, with guaranteed circulation, was started, and in 1860 a free banking act was passed which was very similar to the New York Banking Law of 1837, but before the value of this act could be tested the national banking system came into existence. There was a marked demand for the national charters, which were supposed to exempt the banks from State taxation. By 1868 only 12 State banks remained as against 198 national banks. In 1870-73 more than 90 State banks were chartered by special acts, but the constitution of 1874 prohibited the organization of banks, except under the general law. In 1895 the State banking laws were thoroughly revised and a system established by which all banks, trust companies, mutual savings associations, building associations, and other organizations of this character, except the national banks, were subject to supervision of the Banking Department, its executive officer having power to examine into the condition of the banks of the State, require reports at intervals, and see that they comply with the law. National banks have a larger capital and much larger deposits than

Government. The present constitution was adopted on Dec. 16, 1873, and went into effect Jan. 1, 1874; there have been few important amendments. Amendments may be proposed in the Senate or House of Representatives, but in order to become effective must be adopted by a majority of both Houses of two successive legislatures and finally by the electors. If two or more amendments are submitted, they are voted upon separately.

Legislative.—The legislative power of the Commonwealth is vested in a General Assembly, consisting of a Senate and a House of Representatives. Members are chosen at the general election every second year. Senators are elected for a term of four and Representatives for a term of two years. One-half of the Senators are elected every second year. Senators must be 25 years and Representatives at least 21 years of age. They must have been citizens and inhabitants of the State for four years and inhabitants of their districts one year next preceding their election. The State is divided into 50 senatorial districts, each of which is entitled to one Senator. Representatives are apportioned among the counties in accordance with a prescribed ratio. The Legislature convenes on the first Tuesday in January in odd-numbered years.

Executive.—The executive department consists of a Governor, Lieutenant Governor, Secretary of the Commonwealth, Attorney-General, Auditor General, State Treasurer, Secretary of Internal Affairs, and Superintendent of Public Instruction. The Governor, the Secretary of Internal Affairs, the Auditor General, and State Treasurer hold office for four years and with the exception of the Secretary of Internal Affairs are not eligible to reelection for the next succeeding term. The Governor appoints, with the advice and consent of two-thirds of the Senate, the Secretary of the Commonwealth, the Attorney-General, and the Superintendent of Public Instruction.

Judiciary.—The judicial power is vested in a supreme court, a superior court, courts of common pleas, courts of oyer and terminer and general jail delivery, courts of quarter sessions of the peace, orphans' courts, and magistrates'

courts. The supreme and superior courts consist of seven judges. The supreme court judges are elected for a term of 21 years. One of these is the Chief Justice. The supreme and superior courts are the appellate courts. Each county containing 40,000 inhabitants constitutes a separate judicial district and elects one or more judges for that district. In the County of Philadelphia judicial jurisdiction and powers are vested in five distinct and separate courts of equal and coördinate jurisdiction. These are composed of three judges each. The courts of the several counties are designated courts of common pleas. All judges except the judges of the supreme court are elected for a period of 10 years.

Suffrage and Elections.—Every male citizen 21 years of age who has been a citizen of the United States one month and has resided in the State one year and in the election district two months is entitled to vote. If 22 years of age and upward, he must have paid within two years a State or county tax. General elections are held biennially on the Tuesday following the first Monday of November in even-numbered years. All elections for the several judicial districts and for county, city, ward, borough, and township offices are held on municipal election day, the Tuesday next following the first Monday of November in odd-numbered years. All candidates of political parties for all elective offices except that of presidential electors are nominated at primary elections. Provision is made for a preferential vote for president in the primaries. Provision is made for the personal registration of electors and their enrollment as members of political parties in cities of the first, second, and third classes. Enrollment is also required in all boroughs and townships. All elected officers of cities of the second class and judges of the courts of record are nominated and elected by nonpartisan ballots. Severe penalties are provided for crimes against the electorate. Expenditures of candidates are restricted. A proposed amendment to the constitution providing for universal suffrage was rejected in 1915 by an adverse majority of about 60,000.

Local and Municipal Government.—The units of local and municipal government are counties, cities, incorporated boroughs, and townships. County officers consist of sheriffs, coroners, prothonotaries, register of wills, recorders of deeds, district attorney, clerk of the courts, commissioners, auditors, and controllers who are elected. Three county commissioners and three county auditors are elected in each county for terms of four years, except in counties having a population over 100,000 inhabitants, in which a controller takes the place of the county auditor. Debts of any county, city, borough, township, or district must not exceed 7 per cent of the taxable property, except for certain purposes, when it may be increased to 10.

Miscellaneous Constitutional and Statutory Provisions.—Except by two-thirds vote of all members of each House, appropriations of money must not be made to any charitable or public institution not under the absolute control of the Commonwealth other than normal schools established by law for the professional training of teachers. The Legislature of 1915 created a State commission of agriculture. The same Legislature passed a comprehensive workman's compensation act. There is a legislative reference bureau, created in 1909, to assist in the

preparation of measures passed in the Legislature and to perform other duties in connection with the legislative sessions. There is an excellent child-labor law. There are many measures providing for the safety and health of persons working in and about the coal mines. A public-utilities commission was created by the Legislature of 1913, to take the place of the railroad commission. In 1913 electrocution was substituted for hanging as a method of execution.

Finances. The first direct State tax was levied in 1785, but was discontinued in 1789. Taxes were very unpopular, and the State expected to cover its expenditures by income from public property, sale of public lands, etc. Some taxes were introduced in the beginning of the nineteenth century, but in 1810 the revenue from them amounted to only 20 per cent of the total receipts. In 1825 there were no direct State taxes. About this time the construction of public improvements, which had been going on in a quiet way since 1789, became the cry of the day. Loans were the only available source of necessary means. In 1821 the public debt incurred during the War of 1812 amounted to only \$1,230,000, but new loans followed one another in great rapidity. Canals, roads, bridges, and railroads were built. Between 1789 and 1828 more than \$22,000,000 was spent on these improvements. In 1834 the system of canals and railroads to connect Pittsburgh and Philadelphia was completed at the cost of more than \$14,500,000, and lateral canals were added in 1838 at the cost of almost \$6,500,000. The large sum (more than \$12,000,000) which the United States Bank furnished in 1837, partly as a bonus and partly as a loan to the State, in exchange for a State charter, further stimulated this feverish activity. The State debt was \$24,500,000 in 1835 and in 1842 reached \$40,000,000. Expecting large returns from these improvements, the State did not provide a thorough system of taxation. Interest had to be paid by means of further loans. The credit of the Commonwealth was therefore so much impaired in 1840 that failure was threatening. The income from the improvements did not even cover their expenses, and a law was passed in 1840 imposing small taxes on banks, personal property, and salaries. The revenue from this law did not cover even a tenth part of the expenditures, and the interest on the bonds continued to be paid by issue of special bonds. In 1844 a radical change was made in the financial system. A comprehensive tax was imposed upon all property, stocks, incomes, etc., and cash payment of interest was resumed the next year. For 15 years the debt remained on the same level; the State was not able to cancel any of its obligations and kept on refunding the maturing bonds. In 1857 and 1858 the State works, which were built at the expense of over \$75,000,000, were sold for \$11,000,000 to the Pennsylvania Railroad Company and the Sunbury and Erie Railroad Company, and a gradual reduction of the State debt dates from that time.

In 1860 the debt decreased to \$38,000,000, but the military loan of 1861 increased it by \$3,000,000. A steady decline came after the war. In 1870 the debt was \$28,980,071; in 1880, \$21,561,990; in 1890, \$12,349,920; and from 1895 to 1902 it remained \$6,815,299. By Nov. 30, 1906, bonds were bought at a high premium by the sinking fund to such an amount that the debt was reduced to \$3,646,167, against which

the sinking fund had \$3,586,021. These results were only possible by vigorous taxation. The Law of 1844 taxed all property, but real estate was released from State taxation in 1867. The income tax survives, but contributes a trifling sum. The taxes on personal property and inheritances are productive of more revenue. The main sources, however, are the taxes on corporation stocks and receipts and various licenses, Pennsylvania having introduced the high-license principle. On Nov. 30, 1914, there was a balance on hand in the treasury of \$7,427,208. The receipts for the fiscal year were \$31,441,050 and the expenditures \$31,578,111. The bonded debt at the end of the year was \$651,110, against which there was the sinking fund of \$811,733.

Militia. The males of militia age in 1910 numbered 1,788,619. The total strength of the organized militia on Jan. 1, 1914, was 10,190 men and 745 officers. The State militia includes four brigades of infantry, two squadrons of cavalry, two batteries of field artillery, a company of signal corps, and a company of sanitary troops.

Population. Pennsylvania ranked second in population in 1910. The population at each Federal census was as follows: 1790, 434,373; 1800, 602,365; 1810, 810,091; 1820, 1,049,458; 1830, 1,348,233; 1840, 1,724,033; 1850, 2,311,786; 1860, 2,906,215; 1870, 3,521,951; 1880, 4,282,891; 1890, 5,258,113; 1900, 6,302,115; 1910, 7,665,111. The estimated population for 1915 was 8,383,992. The urban population (in places of 2500 or more) in 1910 was 4,630,669. There was in that year an average of 171 persons to the square mile. The total population consisted of 3,942,206 males and 3,772,905 females. There were 6,028,994 native whites and 1,438,719 foreign-born whites. The negroes numbered 193,919, and there were a few Indians, Chinese, and Japanese. Of the foreign-born whites 17.5 per cent came from Austria, 16.7 per cent from Russia, 13.6 per cent each from Germany and Italy, and 11.5 per cent from Ireland. Some 90.6 per cent of the total native population were born in the State. New York contributes 9.4 per cent of those born in other States and Maryland 1.8 per cent. There were 2,309,026 males of 21 years of age and over. There were 10 cities with a population of 50,000 or over in 1910. These with their population in 1910 and 1914 (estimated) are as follows: Philadelphia, 1,549,008 and 1,657,810; Pittsburgh, 533,905 and 564,878; Scranton, 129,867 and 141,351; Reading, 96,071 and 103,361; Wilkes-Barre, 67,105 and 73,660; Erie, 66,525 and 72,401; Harrisburg, 64,186 and 69,493; Johnstown, 55,482 and 64,642; Altoona, 52,127 and 56,553; Allentown, 51,913 and 60,297.

Education. The first provision for education in the wider sense was made by William Penn, who in his "Frame of Government" provided that "The Governor and Provincial Council shall erect and order all public schools," and "that the children within this province within the age of twelve years shall be taught some useful trade or skill." The second Assembly in 1683 strengthened the clause by providing for compulsory instruction in reading and writing as well as in some manual trade. The first free public schools were opened in 1769 by settlers from Connecticut, but it was not until 1834 that the free public-school system was successfully established.

There were, in 1910, 354,290 persons of 10 years of age or over who were illiterate. This was a percentage of 5.9 of the total population, a higher percentage than is found in any other of the Middle Atlantic States, due chiefly to the large element from southeast Europe in the population. The percentage among native whites of native parentage was 1.4, among native whites of foreign or mixed parentage 1.1, among foreign-born whites 20, and among negroes 9.1. The total school population in the same year was 2,194,303, of which 1,366,541 attended school. The report of the State Superintendent of Public Instruction for 1914 shows that there were in that year 2568 school districts, with 37,787 schools and 15,306 schoolhouses. The whole number of pupils was 1,401,325, and the average daily attendance was 1,124,951. In all the schools there were 39,596 teachers. Of these 31,246 were women. The average monthly salary of male teachers was \$68.06, of female teachers \$49.88. The average length of the school term was 8.6 months. In 1914 there were 207 first-grade high schools, 269 of the second grade, and 408 of the third grade. The total expenditures were \$52,544,036, of which \$23,834,407 was expended in teachers' salaries.

The public-school system is under the direct supervision of the State Superintendent of Public Instruction, who is appointed by the Governor. In each county is a superintendent elected by the school directors, who in turn are elected by the people. A new school code adopted in 1911 increased the powers of the State Board of Education and provided for a permanent school fund, consisting of all escheated estates and revenue derived from the sale of land and public property and from the forest reservations. A bureau of vocational education, established in 1913, has done effective work along special lines of instruction and agriculture, home economics, manual training, and the industrial arts. State aid is given to such vocational schools as are approved by the State Board of Education. During the year 1913-14, 21 districts in 17 different counties qualified for State aid by establishing various types of vocational schools or departments. During the year 1914-15 at least 20 more districts in 11 other counties were added to this list. The most serious problem of the State is rural schools, and considerable progress has been made in improving their condition.

There are State normal schools at West Chester, Millersville, Kutztown, East Stroudsburg, Mansfield, Bloomsburg, Shippensburg, Lock Haven, Indiana, California, Slippery Rock, Edinboro, and Clarion.

There are many institutions of collegiate rank. The most important of these are the University of Pennsylvania at Philadelphia, Pennsylvania State College at State College, University of Pittsburgh at Pittsburgh, Lafayette College at Easton, Lehigh University at South Bethlehem, Swarthmore College at Swarthmore, Pennsylvania College at Gettysburg, Dickinson College at Carlisle, Haverford College at Haverford, Franklin and Marshall College at Lancaster, Temple University at Philadelphia, Washington and Jefferson College at Washington, and Ursinus College at Collegeville. Colleges for women are the Allentown College for Women at Allentown, Beaver College at Beaver, Moravian College at Bethlehem, Blairsville College at Blairsville, Bryn Mawr College at Bryn

Mawr, Wilson College at Chambersburg, Irving Female College at Mechanicsburg, and Pennsylvania College for Women at Pittsburgh. Roman Catholic colleges are St. Vincent College at Beatty, La Salle College and St. Joseph's College at Philadelphia, and Duquesne University of the Holy Ghost at Pittsburgh. The Carnegie Technical University at Pittsburgh is the best-known scientific institution. There are important medical schools in Philadelphia and in Pittsburgh and theological seminaries at Chester, Mount Airy, Meadville, Beatty, Philadelphia, Gettysburg, Bethlehem, Lancaster, and Pittsburgh. The United States Indian School at Carlisle is a famous institution for the training of Indians.

Charities and Corrections. The State charitable and correctional institutions include the State Institution for the Feeble-Minded of western Pennsylvania at Polk, State Hospital for the Criminal and Insane at Fairview, Homœopathic State Hospital for the Insane at Allentown, State Hospital for the Insane at Danville, Pennsylvania State Lunatic Hospital at Harrisburg, State Hospital for the Insane at Norristown, State Hospital for the Insane at Warren, State Asylum for the Chronic Insane at Wernersville, Home for the Training in Speech of Deaf Children at Philadelphia, Pennsylvania Oral School at Scranton, Eastern Penitentiary at Philadelphia, Western Penitentiary at Pittsburgh, Pennsylvania Industrial Reformatory at Huntingdon, Pennsylvania Reform School at Morganza, and Pennsylvania Soldiers and Sailors Home at Erie. The average number of persons in these institutions in 1914 was 15,118. There were paid for their maintenance \$4,295,993. In addition to these there are a number of semi-State institutions which receive State aid. There are State hospitals at Ashland, Blossburg, Coaldale, Connellsville, Hazleton, Mercer, Nanticoke, Philipsburg, Scranton, and Shamokin. The supervision of the charities and corrections is in the hands of the Board of Public Charities.

Religion. Roman Catholics form over one-sixth of the population. The principal Protestant denominations are the Methodist, the Presbyterian, the Lutheran, the Baptist, the Reformed church, the Protestant Episcopal, and the United Brethren.

History. Henry Hudson in the *Half Moon* anchored in Delaware Bay, Aug. 28, 1609, and founded the Dutch claim to the bay and river, though he did not land. After 1614 exploring parties were sent out and trading posts founded on the east side of the river. Gustavus Adolphus of Sweden planned to found a colony in America, and under his daughter, Queen Christina, Peter Minuit, formerly Governor of New Netherland, built Fort Christina within the present limits of Delaware in 1638 and began to trade with the Indians. John Printz arrived with other colonists in 1643 and built New Gottenburg on Tinicum Island, the first settlement within the present limits of Pennsylvania. The Dutch looked with jealousy upon these and other Swedish settlements afterward founded and to offset the advance made by the Swedes built Fort Casimir at the site of the present town of New Castle, Del. This was captured by the Swedes in 1654, but in September, 1655, Governor Stuyvesant of New Netherland appeared in the bay with seven vessels and overthrew the Swedish authority. The city of Amsterdam had furnished much of the money for

this conquest, and in return the southern settlements were assigned to that city under the name of New Amstel. The Company colony was left in charge of Governor Stuyvesant, but in 1663 the two were reunited. When the Duke of York took possession of New Netherland in 1664, the settlements on the Delaware were included and remained attached to New York until 1682. On March 4, 1681, William Penn (q.v.), in return for a debt of £16,000, owed to his father by Charles II, secured a grant of the territory west of the Delaware River between 40° and 43°, extending to the west five degrees, at an annual rent of two beaver skins and one-fifth of the gold and silver ore discovered in the region. As New Castle was supposed to be on or near the fortieth degree, the east boundary was to begin where a circle, having its centre at that settlement, 12 miles in radius, intersected the Delaware River and the south boundary to begin at the point where that circle intersected the fortieth degree. Full feudal rights, both to the soil and to the government, were granted. On Dec. 6, 1682, Penn secured from the Duke of York the grant of the soil of the lower settlements and by consent assumed governmental rights. These settlements were within the original Maryland patent, but Lord Baltimore complained in vain. They remained attached to Pennsylvania, though with separate legislatures after 1703, until the Revolution, under the names "the Lower Counties" or "the Territories." The south boundary caused much trouble later. When it was found that the fortieth degree was north of the present site of Philadelphia, the ingenious theory was announced that the beginning of the fortieth degree was at 39°. The matter was finally settled by a compromise in 1760 (see MASON AND DIXON'S LINE), when also the north boundary was fixed at 42°.

Upon receiving the grant Penn sent over his kinsman, William Markham (q.v.), as Deputy Governor, and followed himself in 1682, arriving at Uplands (now Chester) October 27. A few days later he concluded a treaty with the Indians, though the purchase of the lands could not have taken place until later. A "Frame of Government" previously published in England was submitted to the first General Assembly in December, 1682, and was adopted together with the "great law," made up largely of the suggestions of the Proprietor. Universal suffrage and entire religious toleration made the scheme notable. Settlers came over in great numbers, chiefly Quakers and Germans from the Palatinate. Philadelphia, which had been planned before Penn left England, grew rapidly and before 1683 contained more than 500 inhabitants, while more than 3000 settlers had come to the province. Land was offered at 40 shillings the hundred acres, subject to a quitrent of a shilling a year. Penn returned to England in 1684, leaving the Council in charge, but its authority was soon disputed by the Lower House, which had a veto power on legislation, though it could not originate measures. Slanders were circulated in England, and in 1693 the province was resumed by William III and attached to New York. Governor Fletcher met with little success in his attempts to secure aid for his Indian wars and had several contests with the Legislature. The province was restored to Penn in August, 1694, and in 1696 a new and more democratic constitution was adopted with the Proprietor's consent. Penn's second and last

visit to the province lasted from December, 1699, to October, 1701. During this time he granted the Charter of Privileges, adopted Oct. 26, 1701, which served as a constitution until the Revolution. The governors whom Penn appointed were involved in frequent disputes with the Assembly, and in consequence the Proprietor grew discouraged. In 1712 he was on the point of selling the province to the crown for £12,000, but a paralytic stroke prevented the completion of the sale. Though the province was a constant source of expense to him, it made his descendants rich. After Penn's death, in 1718, the disputes between the Assembly and the Proprietors continued with renewed vigor.

Immigration was large. There were Scotch-Irish in the province as early as 1698, and after 1730 they came in great numbers. These generally pushed on to the frontier, as did also the later influx of Germans. The first years were free from Indian warfare, but after 1740 the Indians were restless and soon became openly hostile. The efforts of the French were successful, and forts were established on the Ohio. The province sent few men to the aid of General Braddock in his expedition against Fort Duquesne in 1755; but his defeat aroused the Assembly, and a chain of forts was erected at a cost of £85,000. Until after 1764 danger from the Indians was constant. Meanwhile, in 1753, Connecticut laid claim to a tract of land on the Susquehanna, 70 miles west of the Delaware, under the charter of 1602, which granted to Connecticut the land to the forty-first degree. A company was formed, the land was purchased from the Indians in 1754 (though previously purchased by Pennsylvania), and Susquehanna County was formed. Settlers went in, and the formation of a distinct colony was considered. The Indians claimed that the purchase was made by fraud and protested vigorously. Armed forces were sent from eastern Pennsylvania and brought on the so-called Pennamite War; the dispute had its influence in causing the Wyoming Massacre in 1778. See WYOMING VALLEY.

The Colony's agent, Benjamin Franklin, vigorously resisted the Stamp Act, and in July, 1774, a Provincial Congress met at Philadelphia, adopted resolutions, and elected delegates to the first Continental Congress, to be held at Philadelphia. The Provincial Convention in 1775 authorized the Committee of Safety to prepare a system of defense for the Colony. Troops were raised, and boats were built. After the Declaration of Independence the proprietary government ceased in Pennsylvania, and a State constitution was drawn up, Sept. 28, 1776. It provided for a Supreme Executive Council, one Legislative House, and a Board of Censors. The Royal Charter was annulled by the King in 1778, and the State secured the commutation of the quitrents in 1779. During the Revolution the eastern part of the State was the scene of important operations. Philadelphia was at different times the seat of the Continental Congress and the British headquarters. The question of the west boundary was settled in 1784, with the consent of Virginia, by measuring five degrees west from the Delaware River and then due north. The possession of the Wyoming lands was given to the State by decision of Congress in 1782, but when it was found that the line of 42° excluded Lake Erie, Congress in 1788 authorized the addition of the triangle bordering upon the lake. In 1787 the State

ratified the Federal Constitution. In 1790 a new constitution was adopted. The growth and prosperity of the State was marked, though the population was turbulent. The Whisky Rebellion (1794) grew out of the unwillingness of the Scotch-Irish to submit to the excise tax. The imposition by the national government of the window tax led to the Hot-Water Rebellion among a part of the German population in 1798. Internal improvements were projected early, and the Schuylkill Canal was begun in 1815 and completed in 1825. From 1829 to 1836 the projected improvements called for the construction of 292 miles of canal and 126 miles of railroad, at a total cost of \$35,000,000. The first bill for a public-school system was passed in the face of violent opposition in 1834. Though both iron and coal had been known to exist before the Revolution, it was not until 1839 that anthracite was successfully applied to the manufacture of iron. The first oil well was sunk near Titusville in 1859.

At the outbreak of the Civil War five companies of Pennsylvania troops were the first to arrive in Washington under President Lincoln's call for troops on April 15, 1861, and 25 regiments were formed during the month. The draft was necessary before the end of the war, but troops were furnished. The State was three times invaded, twice at Chambersburg and once by General Lee's army, which fought the battle of Gettysburg (q.v.). Since the war the chief events of importance have been the rapid growth of the steel, oil, and coal industries and frequent labor troubles. In 1877 a great strike of railroad employees led to violence and the defeat of the militia at Pittsburgh. The dispatch of regular troops was necessary to quell the disorder. On May 31, 1889, a dam at the outlet of Conemaugh Lake broke, and a great wall of water overwhelmed Johnstown (q.v.) and several smaller towns, drowning more than 2000 people and destroying property to the value of \$10,000,000. The strike at the Carnegie Company's mills at Homestead, near Pittsburgh, July 6, 1892, was one of the most serious ever known in America. Martial law was declared, and the entire militia force was called out. An extensive strike of coal miners in Hazelton region in 1900 was followed by a general strike in the anthracite region in 1902.

A new State capitol was completed at Harrisburg in 1907. Its construction was authorized in 1901, when an appropriation of \$4,000,000 was made for its erection. An examination into the books of his department made by William H. Berry, who became State Treasurer in May, 1906, revealed great discrepancies between the estimates and expenditures for furnishing and decorating the capitol. The Legislature of 1907 authorized a commission to investigate the matter and found that several millions of dollars which had not been accounted for had been paid for furnishing and decorating the capitol. Indictments were found against the contractor, the architect, and several former State officials. Several of these men after a prolonged trial were found guilty.

In 1908 Philander C. Knox, United States Senator, was appointed Secretary of State. In the presidential election of 1908 Taft received 745,779 votes and Bryan 448,785. In January, 1909, Boies Penrose was reelected by the Legislature for United States Senator for his third term.

In 1910 the Republican party nominated John K. Tener for Governor and the Democrats Webster Grim. A body of Republicans and Democrats who were dissatisfied with the results of their party conventions organized a new party known as the Keystone Independent party and nominated William H. Berry for Governor. The entire Republican ticket was elected, but Mr. Berry received nearly three times the number of votes cast for the Democratic nominee.

In 1912 the Independent or Progressive elements in both great parties developed such strength that the old leaders were practically deprived of their power. In the Republican party the advocates of Mr. Roosevelt's candidacy were able to carry the primaries for delegates to the national and State conventions. After the Republican National Convention and the nomination of Taft and Sherman, the Progressive party organized. At the Democratic primaries Wilson had practically no opposition. At the election he received 395,619 votes, Roosevelt 447,426, and Taft 273,305. In June, 1913, survivors of the battle of Gettysburg from both the Union and the Confederate armies met in a great reunion on the battlefield to celebrate the fiftieth anniversary of the battle. In the primary elections held in 1914 the Republicans nominated Martin G. Brumbaugh for Governor and renominated Senator Penrose; the Democrats nominated A. Mitchell Palmer, Representative in Congress, for Senator, and Vance McCormick for Governor; the Progressives nominated Gifford Pinchot for United States Senator and William D. Lewis for Governor. In the elections the Republicans elected Brumbaugh Governor by a vote of 590,701 to 452,882 for McCormick. Senator Penrose was reelected. In this election the Republicans showed a gain of over 300,000, the Democrats a gain of over 50,000, and the Progressives a loss of over 150,000 votes compared with 1912.

In national elections the State was at the outset Federalist, but, in 1796, 14 of its 15 votes were cast for Jefferson. Eight votes were cast for him again in 1800, while seven went to the Federalist candidate. From this time until 1840 the State was Democratic. In 1835 the Antimasonic party succeeded in electing the Governor, and the agitation gave the State to the Whig electors in 1840. In 1838 a dispute between the Democrats and Whigs concerning the results of an election in one of the State congressional districts caused much excitement, each party contending that it had elected not only the Congressman, but the members of the State Legislature in that district. The disturbance, which was later known as the Buck-Shot War, was, however, short-lived, and the dispute was settled in favor of the Democrats. The State gave its vote to Polk in 1844, to Taylor in 1848, and in 1852 and 1856 to the Democratic candidates. In 1912 Roosevelt, Progressive, carried the State. Since 1860 Pennsylvania has been Republican in national affairs, though, by reason of certain factional fights in the Republican ranks, a Democratic Governor has been twice elected.

GOVERNORS OF PENNSYLVANIA

UNDER THE SWEDES

Peter Minuit.	1638-41
Peter Hollandaer	1641-43
John Printz	1643-53
John Pappogoya	1653-54
John Claudius Rysingh	1654-55

UNDER THE DUTCH

Peter Stuyvesant, Director General of the New Netherland	1655-64
Derek Smidt, Schout Fiscal.	1655
John Paul Jacquet, Vice Director.	1655-57

COLONY OF THE CITY

Jacob Alricks, Director.	1657-59
Alexander d'Hinyossa	1659-63

COLONY OF THE COMPANY

Goeran Van Dyck, Schout Fiscal	1657-58
William Beekman, Vice Director	1658-63
Alexander d'Hinyossa, Director of United Colony	1663-64

UNDER THE ENGLISH

Richard Nicolls	1664-67
Francis Lovelace	1667-73

RECAPTURED BY THE DUTCH 1673

Anthony Colve, Governor-General	1673-74
Peter Alricks, Commander	1673-74

UNDER THE ENGLISH

Sir Edmund Andros	1674-81
-------------------	---------

PROPRIETARY GOVERNMENT

William Markham, Deputy Governor	1681-82
William Penn, Proprietor	1682-84
The Council (Thomas Lloyd, President)	1684-88
The Five Commissioners.	1688
Capt John Blackwell	1688-90
The Council (Thomas Lloyd, President)	1690-91
Thomas Lloyd, Deputy Governor	1691-93
William Markham, Deputy Governor Lower Counties	1691-93

UNDER THE CROWN

Benjamin Fletcher, Gov. of New York, Governor	1693-95
William Markham, Lieutenant Governor	

PROPRIETARY GOVERNMENT

William Markham, Lieutenant Governor	1695-99
William Penn, Proprietor	1699-1701
Andrew Hamilton, Lieutenant Governor	1701-03
The Council (Edward Shippen, President)	1703-04
John Evans, Lieutenant Governor	1704-09
Charles Gookin,	1709-17
Sir William Keith,	1717-26
Patrick Gordon,	1726-36
The Council (James Logan, President)	1736-38
George Thomas, Lieutenant Governor	1738-47
The Council (Anthony Palmer, President)	1747-48
James Hamilton, Lieutenant Governor	1748-54
Robert Hunter Morris,	1754-56
William Denny,	1756-59
James Hamilton,	1759-63
John Penn,	1763-71
The Council (James Hamilton, President)	1771
Richard Penn, Lieutenant Governor	1771-73
John Penn,	1773-76
Council of Safety (Thomas Wharton, President)	1776-77

PRESIDENTS OF THE SUPREME EXECUTIVE COUNCIL

Thomas Wharton, Jr.	1777-78
George Bryan (acting)	1778
Joseph Reed	1778-81
William Moore	1781-82
John Dickinson	1782-85
Benjamin Franklin	1785-88
Thomas Mifflin	1788-90

GOVERNORS OF STATE

Thomas Mifflin	Federalist	1790-99
Thomas McKean	Democratic-Republican	1799-1808
Simon Snyder	"	1808-17
William Findlay	"	1817-20
Joseph Heister	Independent Democrat	1820-23
John Andrew Shulze	Democratic-Republican	1823-29
George Wolf	"	1829-35
Joseph Ritner	Antimasonic	1835-39
David Rittenhouse Porter	Democratic	1839-45
Francis Rawn Shunk	"	1845-48
William Freame Johnston	Whig	1848-52
William Bigler	Democratic	1852-55
James Pollock	"	1855-58
William Fisher Packer	"	1858-61
Andrew Gregg Curtin	Republican	1861-67
John W. Geary	"	1867-73
John F. Hartranft	"	1873-79
Henry M. Hoyt	"	1879-83

GOVERNORS OF STATE—Continued

Robert E. Pattison . . .	Democratic	1883-87
James A. Beaver . . .	Republican	1887-91
Robert E. Pattison . . .	Democratic	1891-95
Daniel H. Hastings . . .	Republican	1895-99

PENNSYLVANIA, HISTORICAL SOCIETY OF. An association organized in Philadelphia, Dec. 2, 1824, and incorporated June 2, 1826. Its object is the elucidation of history, with special reference to that of Pennsylvania. It has a valuable historical and genealogical library at Philadelphia. The society has a subscribed publication fund of \$40,000, the revenue from which is expended in printing matter of historic interest. This fund has published 14 volumes of *Memoirs of the Society* and 39 volumes of the *Pennsylvania Magazine of History and Biography*, issued in quarterly numbers. The society has published a historical map of the State, a volume of *Collections*, one of *Bulletins*, and one on *Pennsylvania and the Federal Constitution*. The library contained, in 1915, 152,000 books, 258,000 pamphlets (special), and 5200 volumes of manuscripts.

PENNSYLVANIA, UNIVERSITY OF. An institution for higher education in Philadelphia, Pa., established in 1740 as a charitable school and raised to the grade of an academy in 1751 through the efforts of an association of citizens formed in consequence of a pamphlet published by Benjamin Franklin, entitled *Proposals Relative to the Education of Youth in Pennsylvania*. The academy, consisting of an English, a mathematical, and a Latin school, each under a master, with subordinate tutors and ushers, proved so successful that in 1753 it received a charter from the Proprietors, Thomas and Richard Penn. Two years later it had attained a standard which justified the granting of degree-conferring powers, and in 1755 the institution was converted into the College and Academy of Philadelphia. During the agitated times of the wars with the French, the provost, the Rev. William Smith, opposed so vehemently the nonresistance policy of the Pennsylvania Legislature that he was arbitrarily thrown into prison, where he faithfully received his classes. He was subsequently sent to England to raise funds for an endowment, and there met the commissioner from King's (Columbia) College on a similar mission. Through the influence of the Archbishop of Canterbury they received a circular letter from the King, and succeeded in raising a considerable endowment for each college. On Dr. Smith's return a letter to the trustees from the Archbishop of Canterbury, Thomas and Richard Penn, and the Rev. Samuel Chandler represented that the institution was originally founded and carried on for the benefit of a mixed body of people; that at the time of making the collection its officers included representatives of various Christian denominations; and, since jealousies had arisen between parties, it was recommended to the trustees to make a fundamental declaration to prevent inconveniences of this kind. Accordingly, in 1764, the trustees bound themselves and their successors to retain the original wide plan of the institution and "to use their utmost endeavors that the same be not narrowed, nor the members of the Church of England, or those dissenting from them (in any future election to the principal offices), be put on any worse footing in this seminary than they were at the time of receiving the royal brief." In 1779 this resolution was construed by the Legislature into a "narrowing of the foundation," and was seized as a pretext for confiscating all the rights and properties of the college, which were bestowed upon a new organization, called in the charter the "Trustees of the University of the State of Pennsylvania." Ten years later these rights and properties were restored, and in 1791 an Act was passed amalgamating the old college with the new university under its present title. In 1872 the university was removed from the centre of the city to the present site near the west bank of the Schuylkill River.

The departments of the university are the College, the School of Arts, the Towne Scientific School, the Wharton School, the departments of Philosophy (Graduate School), Law, Medicine, Dentistry, Veterinary Medicine, and School of Education; the Wistar Institute of Anatomy and Biology; the Henry Phipps Institute; the Laboratory of Hygiene; the Veterinary Hospital; the Library, Psychological Clinic, and the Flower Astronomical Observatory; Physical Education, and the University Museum The

School of Arts offers courses in arts and science, biology and music. The Towne Scientific School offers courses in architecture, science and technology, mechanical, electrical, civil, and chemical engineering, and chemistry. Free tuition in the university is offered through the two Penn scholarships, filled by the Governor of the State, Philadelphia free city scholarships, competitive State scholarships, and general scholarships not confined to special localities. The college courses in arts and sciences and in biology are planned to enable the student to complete his work in three, four, or five years, at his option, the successful completion of 60 units of work being required for graduation. Students are not permitted to take less than 12 units a year, a unit being defined as one hour's work a week for one year in lectures or recitations, or two hours' work a week in laboratory practice. Provision is made for a senior composite year, in which nine units are credited to the work of the first-year class in medicine. In the Towne Scientific School the technical courses cover four years. The Wharton School offers courses in finance and commerce. A feature of the Graduate School is the generous establishment of fellowships and scholarships on the Harrison Foundation.

Of the professional schools of the university that of medicine is particularly well known. The Dental School has a wide reputation, especially in Australia and in Spanish-American countries. The Flower Astronomical Observatory is situated 2 miles beyond the city limits, and there is a working observatory in the grounds. The university buildings stand on Woodland Avenue, on property covering more than 100 acres in the city proper, and provide dormitory accommodations for more than 900 students. They include a university hospital, with a training school and home for nurses, and the Howard Houston Hall, a students' club.

The university confers the degrees of bachelor of arts, laws, music, and science, master of arts and science, doctor of philosophy, medicine, dental surgery, and veterinary medicine, and degrees in civil, mechanical, electrical, and chemical engineering and in education and economics. In 1915 the faculty numbered 589 and the student body 7150. The library contained 421,700 catalogued volumes and 50,000 unbound volumes.

The heads of the university, since its beginning as a collegiate institution in 1755, have been: William Smith (1755-80); John Ewing (1780-1802); John McDowell (1807-10); John Andrews (1810-13); Frederick Beasley (1813-28); William Heathcote de Lancey (1828-33); John Ludlow (1834-53); Henry Vethake (1854-59); Daniel Raynes Goodwin (1860-68); Charles Janeway Stillé (1868-80); William Pepper (1881-94); Charles Custis Harrison (1894-1911); Edgar Fahs Smith (1911-). PENNSYLVANIA COLLEGE. An institution for higher education, founded at Gettysburg, Pa., in 1832. The college is nonsectarian and the curriculum offers 10 groups of studies, 3 leading to the degree of A.B. and 7 to the degree of S.B. There are departments of civil,

municipal, mechanical, and electrical engineering in addition to the regular scientific courses. In connection with the college is a preparatory department. There were in the collegiate department, in 1913, 332 students and in the preparatory departments 80. The faculty numbered 31, of whom 7 were in the preparatory departments. The college has an endowment of about \$395,000 and an annual income of about \$53,000. The grounds and buildings are valued at \$325,000. In 1915 a movement was under way to raise \$140,000 for the erection of a science hall and for a new preparatory department. The library contains about 37,000 volumes. The president in 1915 was William Anthony Granville.

PENNSYLVANIA COLLEGE FOR WOMEN. An institution for higher education of women, founded at Pittsburgh, Pa., in 1869, under the auspices of the Presbyterian church. It is situated in Woodland Road, in the residential section of Pittsburgh. The college offers the regular courses, with special advanced courses in social service, music, and expression. It has a preparatory department, with certificate privileges in all colleges. The total enrollment in 1915 was 250, and the faculty numbered 28. The value of the college property in the same year was \$400,000. The library contains about 3000 volumes.

PENNSYLVANIA DUTCH, or **PENNSYLVANIA GERMAN.** The language of the Germans who emigrated to Pennsylvania between 1683 (when Pastorius settled in Germantown) and the middle of the eighteenth century, though the great outpouring from German lands did not begin till 1717. During this time some 100,000 settled principally in the southeastern counties of the State, such as Lancaster, York, Franklin, Cumberland, Berks, Schuylkill, and Lehigh, spreading diagonally through the Colony from the western bounds of the counties of Bucks and Philadelphia to the Maryland line. The emigration was due "partly to the ravaging of the Palatinate and the neighboring provinces by the armies of Louis XIV, partly to religious persecution, partly to the social system of Germany, which operated to hold down the working classes, and partly to that longing for variety which has at various times come over sections of the Germanic race" (Channing). The settlers came chiefly from the Rhenish Palatinate, Württemberg, and Switzerland, with a sprinkling from the Lower Rhine, Bavaria, Alsace, and Saxony. As most of the dialects spoken by these people belonged to the Alemanic and Franconian groups (see **GERMAN LANGUAGE**), the idiom of the Pennsylvania Dutch is really High German, and the confusion with Dutch is due to the fact that the settlers called their language *Deitsch* (a dialectal pronunciation of *deutsch*, German). Although a variety of dialects were originally represented, that of the Rhenish Palatinate (Rhenio-Franconian) so predominated and influenced the others that the language may be regarded as fairly homogeneous. Owing to their segregation in religious communities, the emigrants clung tenaciously to their mother tongue for a long time, but were gradually compelled by force of circumstances to accept many English words, especially those connected with official matters, until the dialect can best be described as a fusion of Franconian, Alemannic, and other German dialects, with an admixture of English varying

from 1 per cent in the rural districts to a large percentage in the towns.

The language exhibits the characteristic dialectic darkening of *a* to *o* (*schlof* for *Schlaf*; *jor* for *Jahr*), further, the fronting of *ö* to *e* (*here* for *horen*; *bes* for *böse*) and of *ü* to *i* (*bicher* for *Bucher*). German *ei* and *äu* generally appear as *e* (*del* for *Teil*; *bem* for *Baume*). The consonants *p*, *pp*, and *d* are not shifted (*pund* for *Pfund*; *kloppe* for *klopfen*; *kopp* for *Kopf*; *dag* for *Tag*; *mudder* for *Mutter*). Final vowels and inflectional *n* are dropped (*mid* for *müde*; *bëm* for *Bäume*; *finne* for *finden*; *gfunne* for *gefunden*).

The writings of the Pennsylvania Germans have been largely of a religious character, such as hymns and polemical pamphlets. They were written as a rule in the High German literary dialect, with, however, a number of exceptions. Within the last 40 years, however, a number of poems in the dialect have been written.

PENNSYLVANIA STATE COLLEGE. A coeducational institution, located at State College, Pa. It was established in 1863 by joint action of the Federal and State governments under the Land Grant Act, although a beginning had been made between 1855 and 1863 under the title The Farmers' High School. The college owns 1200 acres of land, 100 acres of which are set apart for experimental plots and an equal amount, for a campus on which are located 34 college buildings. Forty-one courses of four years each are offered in the six schools of Agriculture, Engineering, Home Economics, Liberal Arts, Mining, and Natural Science. All courses in the School of Liberal Arts lead to the A.B. degree; those in all other schools lead to S.B. Graduate courses are offered leading to the degrees of master of arts and master of science, civil engineer, electrical engineer, engineer of mines, and mechanical engineer. Extension work in agriculture, industrial education, mining institutes, and lyceum courses is conducted throughout the State. Experiment stations are maintained in agriculture, engineering, and mining. In 1914-15 the faculty numbered 261, the four-year students 2017, and the short-course and summer students 1428. There were more than 5000 students in the various correspondence courses. The endowment was \$517,000, the income \$630,739, and the value of the college grounds, buildings, and equipment \$2,167,750. The library contains 67,560 volumes. The president in 1915 was Edwin E. Sparks, LL.D.
